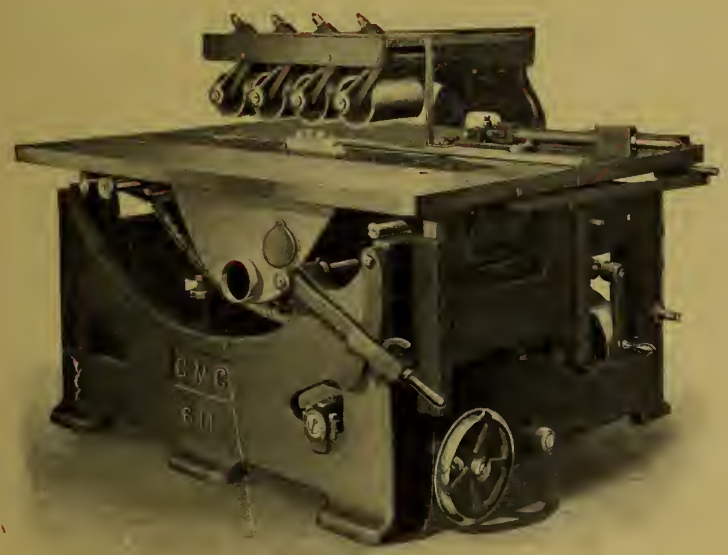
CANADIAN WOODWORKER and Furniture Manufacturer



C.M.C.

No. 611 Straight Edge Ripping and Jointing Saw

This Saw is, we believe, the strongest feeding and most accurate machine of its type on the market to-day. Some of the largest furniture and piano manufacturers of Canada are to-day glueing up their stock right off this Saw without further trueing up on the Jointer, and find the saving in material and labor greatly reduces their operating costs. Why not investigate its merits and be convinced?

Write for our special bulletin "Cut your Costs on a 611 Straight Edging and Jointing Machine." It will interest you.

CANADA MACHINERY CORPORATION, LIMITED, GALT, ONTARIO

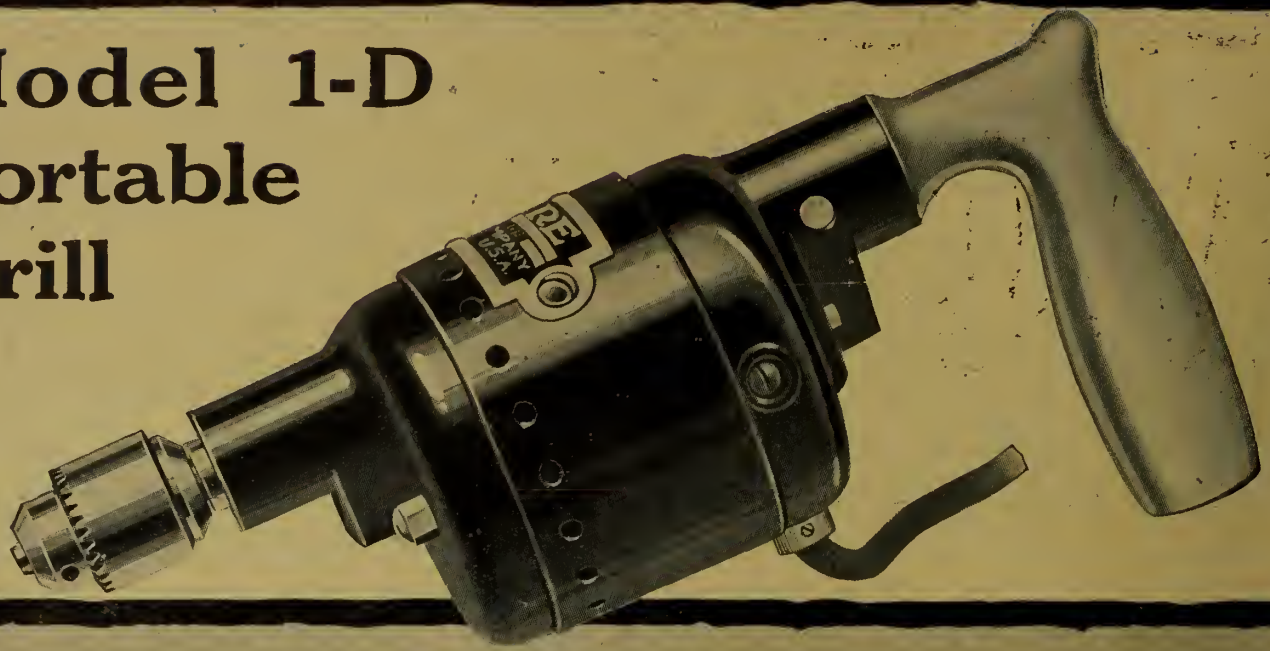
Model 1-D Portable Drill



HANDY—ECONOMICAL—EFFICIENT

Specifications:

Length—10 inches.

Weight—4¾ pounds.

Capacity—Steel, 0 to 3/16". Wood and alloys, 0 to 11/32".

Motor—Universal, on either direct or alternating current.

Diameter of Motor—3⅜ inches.

Spindle—Offset from center 33/64".

Helical Gears.

Aluminum Handle.

Complete with 10-ft. cord, plug, switch and chuck.

Jacob's Chucks used as a regular equipment.

FOR speed in drilling and countersinking small holes, this tool is just what you need. It can be used on any kind of material—steel, iron, brass, aluminum or wood—and gives lasting service.

If your dealer cannot supply you with the Model 1-D, tell us about your requirements.

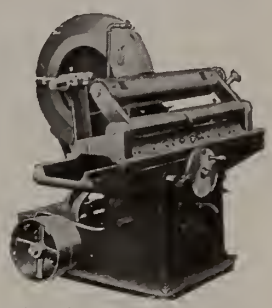
DUMORE GEARED ELECTRIC DRILLS

No. 1 Variety Saw

Woodworking Machinery

New——Used



American No. 200 Automatic Self-Feed Knife Grinder

All these machines are guaranteed in A-1 condition and can be seen in our warehouse at 163 Dufferin St., Toronto.

BAND SAWS
1—36″ Jackson Cochrane.
1—36″ Preston No. 132.

BUZZ PLANERS & JOINTERS
1—24″ American, (Fig. 824) with power feed.
1—No. 199 CMC, 16″ jointer.
1—24″ Preston round head jointer.

SAW TABLES
1—No. 30 American Universal saw bench.
1—No. 7½ American combination saw bench.
1—No. 127 Preston variety saw table.

EDGING SAWS
1—No. 25 American edging and ripping saw.

BORING MACHINES
1—CMC 2 spindle horizontal.
1—Andrews 18 spindle.

SAWS—RIP, CUT-OFF, MITRE, ETC.
1—No. 3 American double cut-off with power feed attachment.
1—No. 2 American iron frame rip saw, Fig. 575.
1—Jackson Cochrane self feed rip saw.
1—Double end mitre machine, CMC.
2—Yates No. 257 self feed rip saws

LATHES
1—CMC wood turning.
1—54″ heavy type back knife gauge.
1—36″ heavy type back knife gauge.
1—Wood lathe, c/s and equipment.

MOULDERS
1—Cowan 10″ four sided outside.
1—American No. 26, 10″ four sided outside.
1—American No. 22, 10″ four sided outside.
1—Hermance 8″ four sided outside.
1—Hespeler 10″ four sided outside.
1—American Houston 8″ four sided with 6″ heads.

SHAPERS
1—Ballantyne 2 spindle.
1—Preston 2 spindle.
1—American No. 1 single spindle.

SCREW DRIVERS
2—Reynolds No. 2, one equipped with boring attachment.
1—No. 4 Reynolds, with magazine for No. 10, 11 and 12 screws.

TENONERS
1—American No. 2½, (Fig. 9431).
1—Ballantyne single end.
1—Cowan single end.

MORTISERS
1—CMC, No. 507 with boring attachment.
1—Wysong & Miles hollow chisel.

PLANERS
1—Preston No. 121, 24″ pony planer.
1—American No. 4½, 36″ single surfacer.
1—MacGregor-Gourlay 24″, single surfacer with sectional rolls and chipbreaker.

ROD & DOWEL MACHINES
1—Jackson-Cochrane with Hawker head, capacity ¼ to 2″.

SANDERS
1—American No. 2 disc & spindle, with iron table.
1—American No. 5, 36″ double disc.
1—CMC No. 548 arm.
2—Canadian Sander Co. disc, motor driven.

FILING ROOM EQUIPMENT
3—Covel No. 40 automatic circular saw sharpeners.
1—No. 2, B.T. & B. band saw sharpener.
1—American No. 9, 37″ automatic knife grinder.
1—American No. 9, 31″ automatic knife grinder.

MISCELLANEOUS
2—Porter spindle carvers.
1—Valley City rounder, 2 spindle.
3—Linderman dovetail glue jointers.
1—Francis double roll 24″ glue spreader for animal glue.
1—45″ Sturtevant, double exhaust fan.
1—60″ Sturtevant single exhaust fan.
1—48 ″ Sturtevant single exhaust fan.
1—36″ Sturtevant, single exhaust fan.
1—No. 16 Detroit Blower Co. exhaust fan.
1—Oliver trimmer, pedestal type.

Pulleys—Wood split, solid iron and pressed steel.
Belting—All sizes, leather, single & double.
Shafting—Various sizes and lengths.

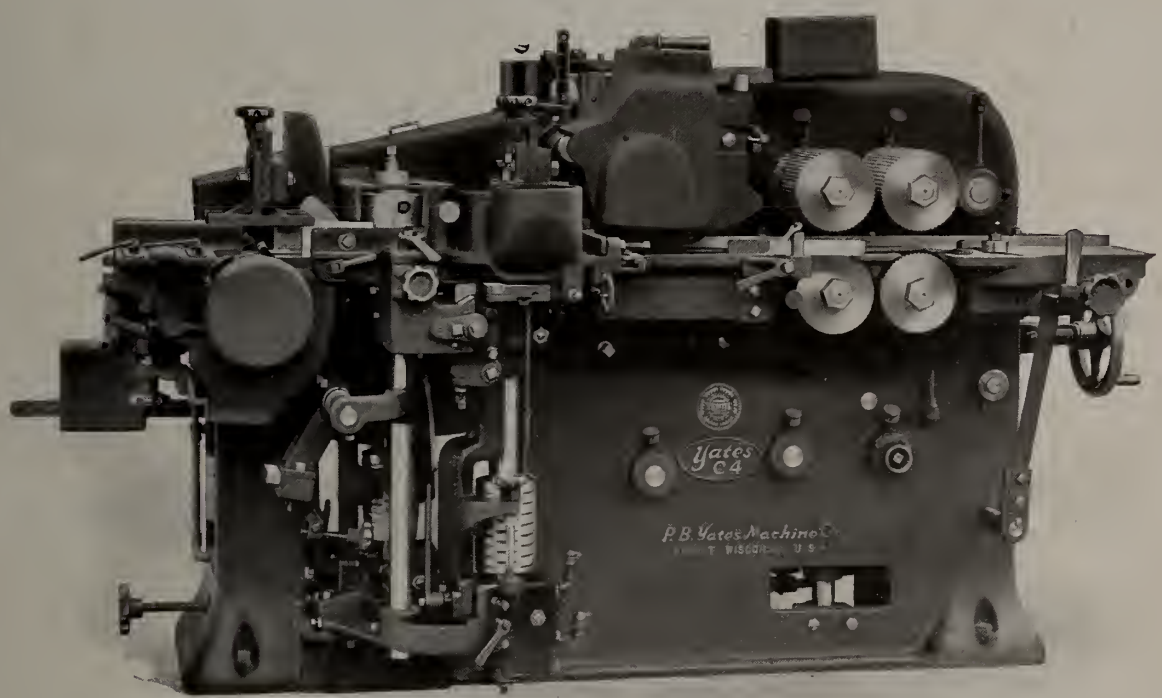
It's "Making Good"—

The Invariable Choice
Yates
Of the Man Who Knows

Type C3 and C4 Moulder



Although practically a new machine, its popularity is shown by the fact that **360** are to be found in mills and factories in North America.

What Greater evidence could you want—it's "Making Good" everywhere, all over the country.

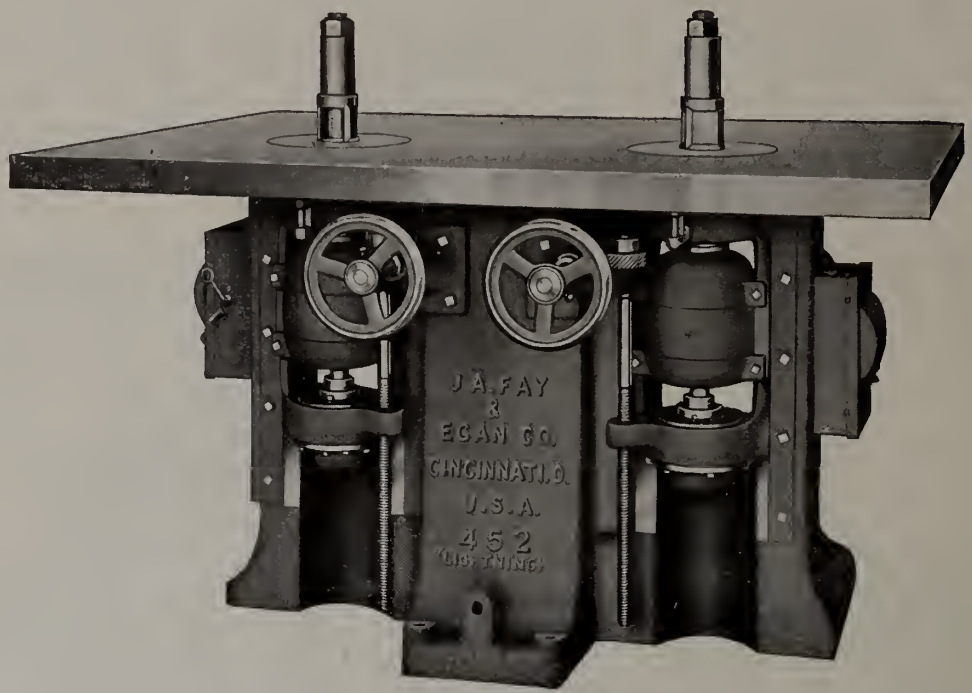
The many superior features have gained for it wide attention and scores of installations, as can be seen from the above figures.

We have a circular

P. B. Yates Machine Co. Limited

Hamilton - Canada

Perfect Work and a Maximum Output



No. 452 "Lightning" Motor Drive Shaper

No. 452 was designed to meet the increased demands made upon production. Built to produce the highest grade of work in furniture and automobile factories, carriage and wagon works, car shops and all kinds of woodworking plants.

The extreme high speed of the spindles insures perfect work and a maximum output. A high speed motor is mounted directly on each spindle, permitting the spindles to operate independently or simultaneously; this being the most modern development in direct motor application, eliminating all belts and countershafts and taking up considerably less floor space than a belt driven shaper. No power is wasted, and the motors have a large overload to take care of the heaviest cut made on a shaper.

For additional information about this wonderful machine write for Bulletin L-15

J. A. FAY & EGAN COMPANY

ESTABLISHED 1830

World's Oldest and Largest Manufacturers of Woodworking Machinery

153-163 West Front Street - Cincinnati, Ohio

The "Shimer Limited" Expansion Head

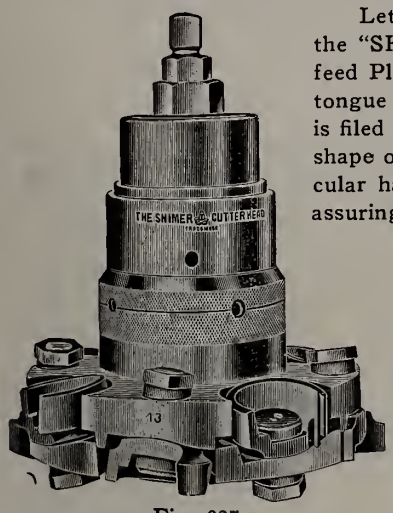


Fig. 627

Let us draw your attention to the advantages of using the "SHIMER CUTTER HEAD" for general Mill and fast feed Planer work. The Cutter is turned to cut the shape of tongue and groove desired, so that to sharpen the cutter it is filed or ground on its face, guaranteeing the user the same shape of cut during the life of the cutter. The bit being circular has from 3½ in. to 5 in. cutting length to the cutter, assuring long wearing life to the cutters

Note that the cutter, being fastened to a concave seat on a compound angle, assures the user of the proper clearance of cutters, consequently they never burn.

These heads are fitted with or without the Self-Centering Sleeve, and made Expansion or Solid, to suit the customer's wishes.

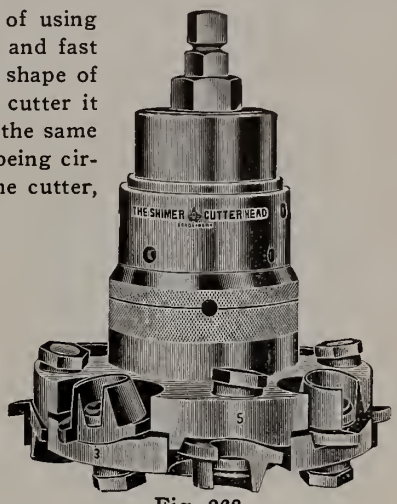

Fig. 268

Shimer Heads have been in use for sixty years, and their reliability and reputation have spoken for them in the past. Let us know your wants and we will guarantee their reliability at the present.

BEATS THEM ALL!

An Automatic Machine for Sanding Handles Smooth as Glass
in the Twinkling of an Eye

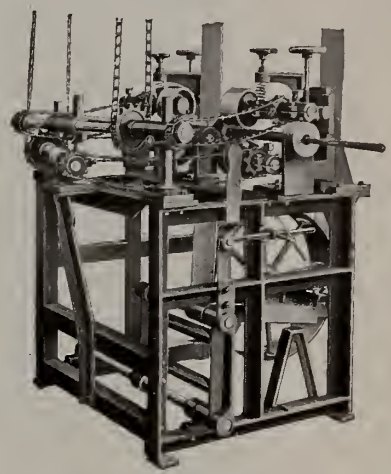
The Rapid Automatic
Sanding and Buffing Machine

Quality: It will make your handles as smooth as the highest grade furniture, their beautiful finish aiding greatly in their ready sale at top-notch prices.

Speed: It sands turned stock at the rate of 70 lineal feet a minute, which lowers the cost per handle to next to nothing.

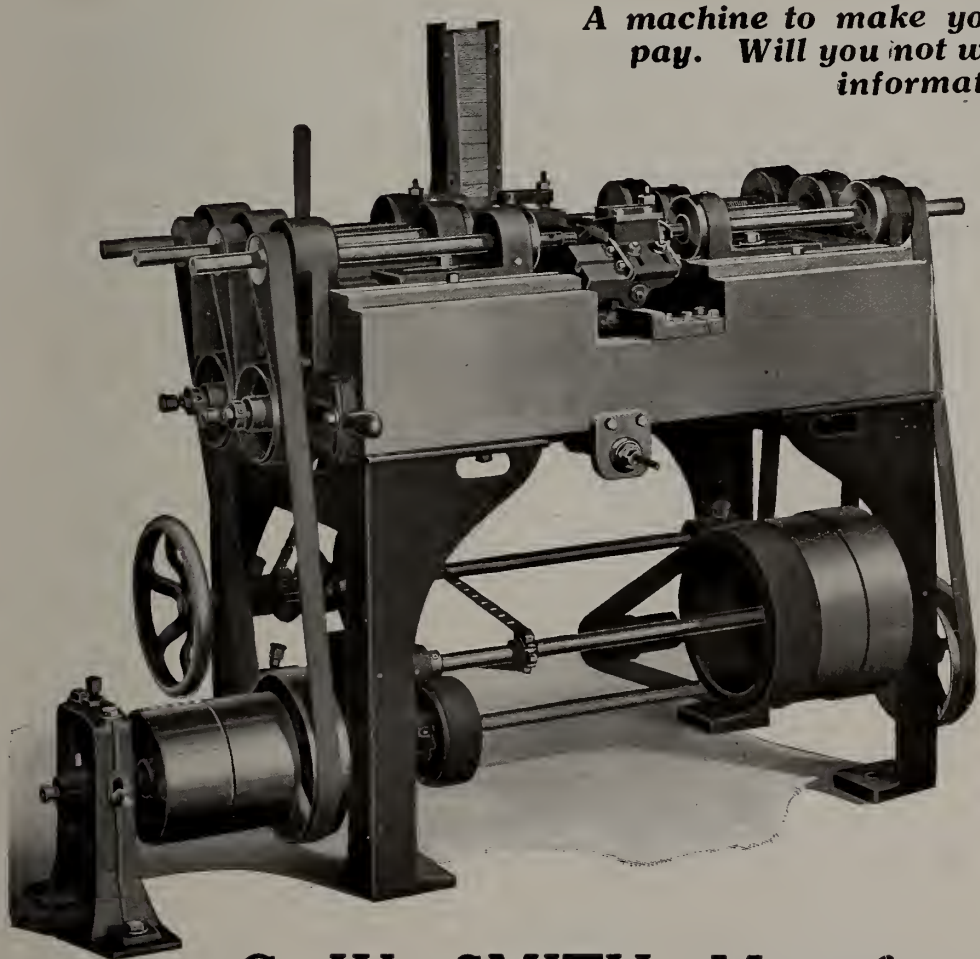
Method: The operation is automatic throughout. Large flat feed rolls, 6-in. diam. by 3-in. face, revolve the stock with such great rapidity against a single belt of fine sand cloth that it is all done with astonishing swiftness.

Capacity: Takes stock from 20 inches up to any length and ¼-in. to 1¾-in. diameter.



No. 75 Rapid Sander

A machine to make your handle business pay. Will you not write for complete information?



New Automatic Pail Handle Machine

which Bores and Turns in one operation.

Capacity from 25 to 40 handles per minute.

Holes are Bored clean and accurately with four Drills. Fitted up complete with Ball bearings and is the best and most perfect working Machine on the market.

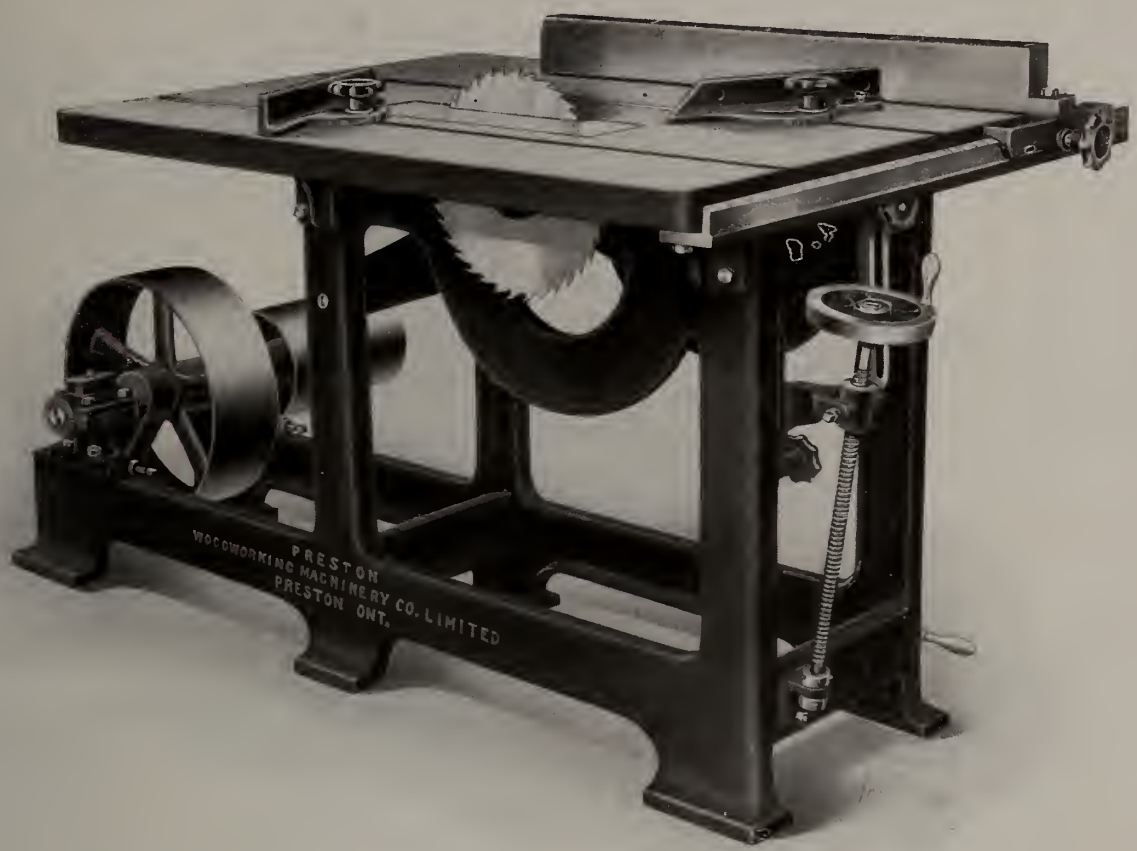
The Preston Woodworking

PRESTON

A Simple, Practical Machine
For Fine Accurate Work



No. 125.—TILTING TOP SAW TABLE

Frame Cast in One Piece. **Easy and Rapid Adjustment of Saw.**
Special Locking Device. **Belt Tightening Bushes on Countershaft.**
Arranged for Individual Motor Drive if Desired.

This Engraving represents a new Rip and Cut Off Saw Table, a medium sized machine, convenient for Dadoing, Grooving, Rabbeting, Mitreing, Bevelling, Etc. It is intended especially for fine and accurate work on Furniture, Sash and Door, Cabinet, Pattern and General Woodworking Shops. The design is simple and practical and the construction is high-class throughout.

The Frame is cast in one solid piece making it rigid and strong. The Table is planed perfectly true and has a removable wood throat plate allowing extra thick saws or Dado Heads to be used. The machine will carry saw blades up to 14″ diameter.

A Boring attachment or a Boring and Mortising attachment with a wood table, can be furnished with this machine, if desired.

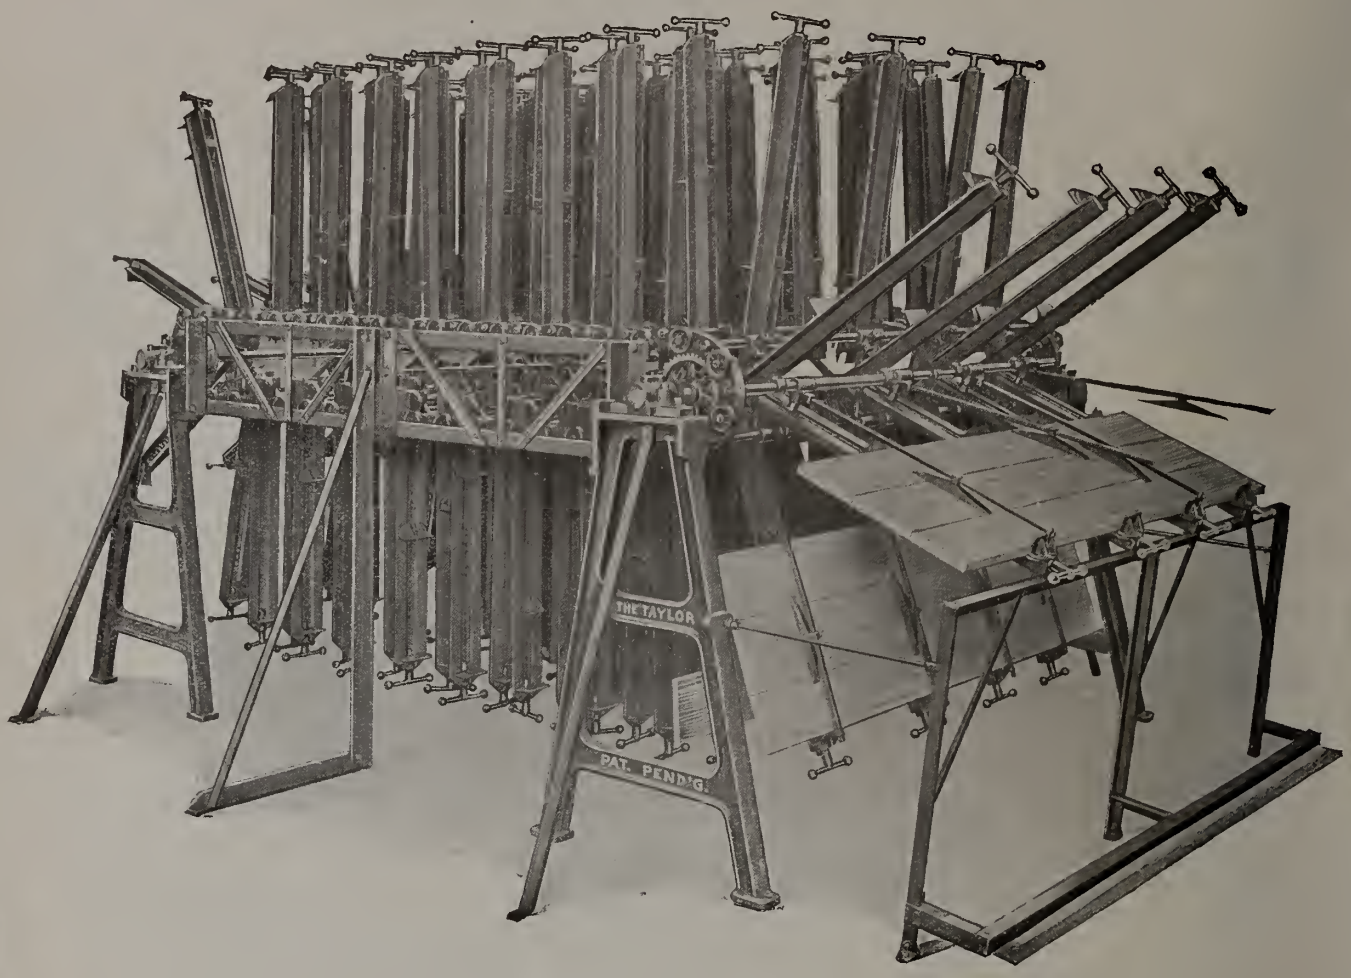
CLAMP The Taylor CARRIER

REG. U.S. PAT. OFF. TRADE MARK



Forty section machine carrying 160 clamps, measuring 8 ft. 2½ in. between shaft centers.

The clamp is one of the most interesting features of the clamp carrier. A remarkable strain can be applied with greatest ease; the work it turns out—both thick and thin stock—is 100 per cent. perfect.

An Engineering concern recently wrote:

"I am recommending Taylor clamps to the Germain Mfg. Co. because I have proven the clamps more efficient through scientific time studies on both and all existing types of gluing-up machines and devices."

As a result of the above recommendations, The Germain Mfg. Co. referred to bought two Taylor carriers. They installed them, and tested them and have since purchased two more. We can tell you numerous instances where customers are using from two to nine Taylor carriers each as a result of similar experiences.

Let us prove the truth of these claims by showing you one of these carriers in operation, or you can try the clamps out on your own work. Ask for C. C. Folder and further information.

James L. Taylor Manufacturing Co.

POUGHKEEPSIE, N. Y.

Even if Fuel Didn't Cost Anything in Your Plant

—that would not be a sufficient reason for continuing the use of ordinary hangers equipped with friction-production plain bearings.

For, in addition to wasting fuel by destroying at least 25 per cent. of your power, hangers with plain bearings demand frequent renewals, require heavier belting, have an unusually high maintenance cost, and are very wasteful of lubrication.

You can largely eliminate the many losses due to plain bearings and make a dividend-paying investment by installing S K F BALL BEARING HANGERS. They permit the shaft to ride almost frictionless not only when well aligned but under extreme conditions of misalignment. The inner race tilts with the shaft—the bearing can never bind.

Because they are practically wear free, S K F Ball Bearing Hangers, besides saving a large percentage of your power, have a much longer life, a lower maintenance cost, and save materially in lubrication.

Don't Overlook this Opportunity

We have just been authorized to sell the high grade equipment in the plant of Messrs. Siemon Bros., Wiarton. The machinery in this plant is of a very high order and has been kept in very satisfactory condition. We list a few items below:

10 Lightning 638 C.M.C. Cut Off Saws.
1 Straight Edge Band Re-Saw.
1 Power Feed Gang Edger Saw and Ripper with countershaft, extension table, only three saws.
1 Power Driven Winch for hauling the cars out of kiln, with about 100 ft. of ¾ in. wire rope.
1 Improved Cutter Head Grinder.
1 Filing Stand and Tracker.
1 42 in. Automatic Knife Grinder.
1 Double End Bench Emery Stand or Grinder.
1 Automatic Saw Gummer.
4 Heavy Lightning Flooring Machines.
1 Flooring Trimmer or Equalizer with End Matching Attachment.
1 End Matcher.
1 Smith Hot Blast Apparatus, consisting of fan, pipe, coils, steel casing, etc.
1 Wheelcock Engine about 200 H.P.—wheel about 14 ft. x 48 in.
1 Simplex Steam Pump, about 6 in. steam cylinder.
1 Closed Feed Water Heater, 24 in. x 6 ft. with 7 in. exhaust opening.
2 Horizontal Return Tubular Boilers, 64 in. dia. x 14 ft. long, each with 80 3½ in. tubes. Heads are ½ in. thick; have 32 stays in each head, each with full flush front, herring-bone grates and standard list of fittings.
1 Double Steel Plate Shaving Exhaust Fan 54 in. size, with 18 in. outlet.

Also Shafting, Drop and Post Hangers, Pulleys, Belting, Warehouse Trucks, Etc.

Waddell Manufacturing Company

Coldbrook and Taylor, N. W. **Grand Rapids, Mich.**

EAGLESFIELD

"Beltless" Swing Saw

Adaptable to close, accurate work

The "Eaglesfield" is the result of very careful study of swing saw requirements, and is designed with a special view to economy, reliability of operation and compactness.

This saw is operated by a specially designed and rated four-horsepower motor, the transmission being direct to the saw mandrel through a set of bevel gears, both saw mandrel and motor shaft being supported in S.K.F. ball bearings.

The hanger is of unified construction to insure rigid support and eliminate vibration. A rocker coil spring is provided instead of the ordinary counter balance weight.

The motor which is mounted in, and forms part of the head, is supplied in 60 cycles, either 2 or 3 phase, and any standard voltage. Speed of motor is 3,600 R.P.M.

One circular saw, which will cut five-inch stock, is included with each machine.

Efficient service is the keynote of membership of the

CANADIAN WOODWORKER and Furniture Manufacturer

—IN—

Canadian National Newspapers and Periodicals Association

—a highly constructive service—absolutely dependable and devoid of prejudice and personal bias. It means much to you!

The policies and principles back of this important service enable you to secure practical and impartial information of great value in business and in the home: and they assure a ready fund of literature of exceptionally high standard at all times.

To read the Association's Standards of Practice listed herewith is to understand what this Association means to you.

Standards of Practice

Canadian National Newspapers and Periodicals Association

THE Members of this Association shall dedicate their best efforts to the cause of business, and public service, and to this end shall pledge themselves:

1. To consider first the interests of the Subscriber.

2. To work for truth and honesty in all departments.

3. To eliminate, in so far as possible, their personal opinions from their news columns, but be leaders in thought in their editorial columns, and make their criticisms constructive.

4. To refuse to publish puffs. free reading notices, or paid write-ups, to keep their reading columns independent of advertising considerations, and to measure all news by the standard "Is it real news?"

5. To decline any advertisement which has a tendency to mislead, or which does not conform to business integrity.

6. To solicit subscriptions and advertising solely upon the merits of the publication.

7. To supply advertisers with full information regarding character and extent of circulation, including detailed circulation statements, subject to proper authentic verifications.

8. To co-operate with all organizations and individuals engaged in creative advertising work.

9. To avoid unfair competition.

10. To determine what is the highest and largest function in the field which they serve, and then to strive in every legitimate way, to promote that function.

This is Number One of a series of advertisements regarding an Association that typifies thorough-going Canadian stability.

An Efemco Product

---In Great, Consistent and *Growing* Demand

That's the Acme Grip Neck Caster, a worthy EFEMCO Product.

A caster that combines utility and durability with *appearance.*

It has compact, sturdy rollers and strong axles. And its graceful lines sacrifice not a whit of stamina or endurance.

It is a light caster in weight, entirely lacking in bulk. The buyer of fine furniture quickly recognizes the merits of such a caster. Hence its growing popularity.

EFEMCO Casters are made in a good variety of sizes and with splendid, durable finishes—for all styles and grades of furniture.

OAK LUMBER

OAK is called "The World's instinctive symbol of **Strength, Endurance** and **Dignity.**"

OAK is described as "The Silent Partner of Architecture and the Arts, throughout history.

OAK is the standard for all comparisons of other woods, used or sought to be used, in the same fields of consumption.

OAK is the finest, most durable, most satisfactory cabinet wood in the world.

OAK has its competitors, but for these competitive woods it cannot be claimed that they are better than oak. For some it is claimed that they are "just as good," that they are cheaper, that they can be made to sail under false colors, by imitating expensive, desirable woods; but oak has stood for ages upon its own merits of quality, of substance, texture, beauty, durability.

Of course all oak is not of equal desirability. Oak that grows intermingled with soft woods is less valuable than that produced from a pure hardwood area.

Generally speaking the thicker the stand of oak the better the quality—the more perfect the texture.

Our hardwood forests in the Appalachian area are unexcelled.

The actual cut of our sawmills in this territory shows that our stand of oak is from 30% to 65% of the total stand of the timber—figures which brand our production of oak as in a class by itself. So perfect is the oak timber in some of this area that 25% of the total production of oak lumber is 1's and 2's and 23% No. 1 Common.

Many dealers and users who have once used our oak prefer to purchase only our manufacture.

With such SUPERIOR LUMBER and the EFFICIENT SERVICE we render, we can adequately supply every need of all our customers.

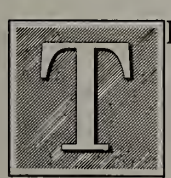
Are You Prepared For a Lumber Famine?



THE present situation among manufacturers, according to market reports, shows that Hardwood Stocks are far short of normal.

To those in close touch with the Lumber industry, there are positive signs pointing to a change in the lumber situation —values are bound to stiffen.

Prices are now at rock-bottom—this will not last. A sudden demand will shoot prices up again.

Just look over YOUR requirements for Birch, Basswood, Hard Maple, or Elm, now—and get quotations from us without delay.

LEXINGTON - - KENTUCKY

American Black Walnut

Enjoys World Wide Appreciation

In spite of most unfavorable rates of exchange, excessive ocean freight tariffs, and limited financial resources Europe wants America Walnut and is now buying. Europeans know walnut is the finest cabinet wood grown, and rightly refuse to consider substitutes.

Virtues of Walnut should be fully recognized on this continent as every phase of the cabinet wood situation today points out the advantage of featuring American Walnut.

All American Walnut is good but Iowa really affords the best.

We are prepared to supply you with
Walnut Lumber and Veneer

Des Moines Sawmill Company

Des Moines, Iowa

"Hartzell's Choice Walnut"

The way Walnut comes to us

COMING AND GOING

One constant stream of American Black Walnut from "Stump to Consumer" flowing through a steady, reliable and satisfactory channel.

"Geo. W. Hartzell"

Logs in the rough coming in Veneers and Lumber of the highest quality going out daily year in and year out covering a period of 35 years.

We rightfully claim your patronage because of "SERVICE and QUALITY," if there is any question in your mind about it

"Try Us and We Will Ship You the Convincer"

No Order too large, no Order too small to receive the close and careful attention it is our custom to give. That is a great part of our business, serving our customers.

Wake-up, Mr. Furniture Man!
Walnut is Plentiful!

AMERICAN WALNUT

"The Cabinet-wood Superlative"

Corners That Stay Square

Chests and cabinets, tables and chairs—how satisfying it is to have their corners stay tight and square, their drawers continue to slide smoothly, their legs remain true and firm through the years.

The corners and drawers and legs of WALNUT furniture have been doing these satisfying things for centuries.

Our museums show multitudes of beautiful examples which have really improved with age. (The Walnut Brochure de luxe shows engravings of many of these. *May we send it?*)

The cabinet maker worthy of the name cannot help but love AMERICAN WALNUT, that superlative cabinet-wood which has almost been the parent of his art and craftsmanship.

So it is your good fortune that there is made every day in America *FURNITURE* of AMERICAN WALNUT which will carry the lesson of your discriminating taste "even unto the third and fourth generation."

You are not forgetting that you want the pleasing Walnut Brochure? Are you? Just drop a line. (*Now* is the best.)

AMERICAN WALNUT
MANUFACTURERS' ASSOCIATION

Room 1019, 616 S. Michigan Blvd., Chicago

ALL BRANCHES OF THE FURNITURE TRADE

are feeling strongly the Effects of the series of tributes to our American Walnut which are running continuously in most of the Best Publications in America. Above is an example.

There are still a few Furniture Houses in the Country

who are giving some of their better-posted competitors a great advantage over them with the Best Trade. WHY? Simply because they "heard somebody say" that American Walnut was getting scarce. Let them ask us for THE FACTS! (See address above.)

Frank Purcell
Walnut Lumber Co.

Plenty of logs like the portion of our stock shown above have made possible the million and a half foot stock of well manufactured American Walnut Lumber which we now have to offer.

High Freight Rates Strangle Industry

Faced with a curtailed demand for their products, the attention of many woodworkers and furniture manufacturers has turned to overseas trade. A market for certain lines of furniture and many articles of wood exists in certain centres in Europe, South America and South Africa, but Canadian manufacturers are prevented from competing successfully with those from other countries, owing to the excessively high cost of land and water transportation.

As an illustration, the case of the North American Bent Chair Co., Limited, of Owen Sound, Ont., might be cited. This firm, who are the largest manufacturers of bent chairs in the British Empire, depend largely on export trade to keep their huge plant in operation. Owing to the exchange situation and the ever-mounting freight charges, they stand to lose many of the overseas connections worked up at a large expenditure of time and money. As they are largely dependant on export trade, the situation is so serious that this large plant may be closed down for an indefinite period.

A few years ago the rates on chairs were 23 cents per hundred pounds to the seaboard and 30 cents for trans-Atlantic freight. This has been increased to 62 cents to the seaboard and $1.50 from there to the other side, a total of $2.12, which represents an increase of 400 per cent. Based on present charges, it costs from 25 to 30 cents per chair to land a shipment in Great Britain. This constitutes an almost insurmountable barrier to the development of Canadian export trade, especially when faced with competition from firms in Sweden, Norway and other nearby countries, where lower wages and cheaper freights prevail.

There is something wrong when the transportation companies, whether under private or public control, are permitted to strangle the industrial development of Canada. This is a condition that works a serious hardship on the country, results in unemployment and reduced production and the railways lose freight, which means decreased earnings, that they would otherwise secure were lower rates in force.

It would appear to be better for the railways and marine lines, including the Canadian Merchant Marine, to handle this business at reduced tariffs than to lose the greater part of it altogether. If the transportation companies will not listen to reason, surely the Board of Railway Commissioners are willing to act, if the matter be brought to their attention. Failing that, the Government might be prevailed to come to the assistance of Canadian industry and aid in the development of overseas trade either by agreeing to pay a certain percentage of the freight on all export business or by subsidizing all Canadian products going overseas. Export trade is needed to rectify the exchange situation, to provide employment and put the country in a prosperous condition. It is in the best interests of all that no efforts be spared to foster and develop outside business.

Shall Wages Be Reduced or Maintained?

It was intimated in the December "Canadian Woodworker & Furniture Manufacturer" that to a certain extent the future of the woodworking industry depends upon conditions in the building and construction trades. As new homes and other buildings are put up and furnished an increased demand is created for furniture and wood products of all kinds. The concensus of opinion seem to be that before building revises to any marked extent, the price of all material entering into the home and its construction must be reduced still further. That may mean that the cost of manufactured building materials, sash, doors, moulding, etc., may be forced down to a still lower level.

This naturally brings up the subject of wages. To what extent should labor assist in bringing costs and prices down so that a demand be created, orders come in freely and work provided for everybody? Shall wages in the woodworking industry be reduced or maintained? Do conditions warrant a reduction in the scale being paid? Would reduced prices on wood products tend to stimulate building and work out to the benefit of all woodworkers? In view of the rates paid in other industries and the difficulties experienced, in the past in securing skilled mechanics, is it advisable to cut wages to any extent? Are lower wages desirable or justifiable?

Whatever is done, the same policy should be followed by all woodworkers. It is a big question, one in which there is plenty of scope for an interesting discussion. The columns of the "Canadian Woodworker" are thrown wide open to all readers. Read the opinions published elsewhere in this issue and send in your views and outline your policy. Let the February "Canadian Woodworker" contain expressions of opinion by leading men in the industry, from coast to coast.

Modern adaptation of Italian Renaissance furniture

Spirit of Italian Renaissance Furniture

Influence Felt Through Succeeding Centuries—Early Craftsmen Understood Design and Proportion—Intentional Relation Between Different Dimensions —Modern Adaptations Command Ready Sale

HISTORY has a way of repeating itself. When the pendulum swings in one direction, it invariably returns and moves to the other side. This is true of business cycles where high production and high prices are usually followed by a period of low productiveness and shrunken values. The same may be said of art and decoration. It has been shown that when popular fancy turns from the tried and beaten pathways of pleasing proportions, graceful lines and attractive ornamentation and clamors for that which is bizzarre and inartistic, sooner or later there comes a revulsion of feeling, a swinging of the pendulum in the other direction and a searching after and a yearning for that which is beautiful and altogether desirable. It is this latter phase, a sense of good taste on the part of the general public, that is spurring on our furniture manufacturers in their efforts to produce attractive, well-designed furniture.

Buffet with Italian Renaissance motif

A swing of the pendulum, which left its imprint on art and decoration for all time to come, known as the Renaissance period, occurred during the later part of the fourteenth and the early part of the fifteenth centuries. While this movement, or "rebirth of art," as it is termed, touched all the countries of Europe, it reached its greatest development in Italy, hence is often spoken of as the "Italian Renaissance period."

All branches of art and decoration were affected, including furniture and furnishings for home. Before that time the furniture was almost a part of the building itself. It was stiff, stately, architectural in appearance, and was practically immovable. Under this regime it took on new lines and new forms, instead of a throne, we find a chair, the huge unweildy boxes were replaced by the more attractive, serviceable chest. This development did not stop there. The furniture became lighter and less unweildy; new forms and styles were introduced and other startling changes took effect.

The craftsmen of the Renaissance period builded upon tried and tested foundations—the experience of the older men, an instinctive grasp of that which constitutes good design and a native instinct for that which is beautiful. Most of the furniture produced was well proportioned, the lines pleasing and the ornamentation well executed and not overdone. They not only understood the principles of good design but adhered strictly to such fundamentals in all their work. This is a point that many present-day designers might take to heart as they seem prone to wander far afield, to experiment often with disastrous results. A study of the trend and development of furniture design tends to prove that when a departure is made from the known principles of design, the results are far from satisfactory.

The best furniture of that period—it was not all good—is distinguished by symmetry, good balance, and perfect proportions. Proportion is to a certain extent governed by mathematical rules, yet is something which is felt and applied instinctively rather than mechanically. There will be found in most of the furniture produced during the Italian Renaissance period an intentional relation between the different dimensions. These dimensions or proportions are

capable of setting up a pleasurable reaction in those of us whose sense of proportion is alive to such influences.

In addition to this sense of proportion, the craftsmen of that day possessed an eye for design. They were able to divide their spaces in a manner calculated to give the effect of grace, dignity or charm and and apply the correct amount and character of ornamentation. This decoration was seldom crude or overdone. The cabinets illustrated herewith show distinct stages of development, each bringing out a distinctive leading characteristic. Thus we are able to catch a spirit of dignity, grace, power and charm worked into pieces of inanimate furniture.

Carving and inlay were the principal forms of decoration used. The inlaying was done largely in ivory and bone. Toward the later part of the 14th century certain forms of mosaic were worked out in the furniture. the materials used being natural and dyed woods and metals. These were at first simple geometrical patterns but soon developed into elaborate pictorial mosaics. As metal work had developed and kept pace with other lines, much of the furniture is ornamented with metal decorations in beautifully wrought steel, iron, brass and bronze.

Cabinet with Italian Renaissance feeling. Suitable for phonograph

Cabinets, chairs, tables, chests and beds were found among the furniture of that period, the cabinets being, probably, the most important. It was usually a thing of dignity. Richly carved and decorated these pieces reflect the skill and ability of those early craftsmen.

High back chairs, in the usual conventional forms, were in abundance. These were more or less stiff but were at the same time stately and attractive, with their flat, square seats and arms. The "curule" or Savonarola chair, which resembles the letter "X," has a distinct appeal owing to grace and beauty of its lines and its pleasing proportions.

Italian Renaissance tables of the best forms have survived to the present day. The best known style is oblong and supported at the ends by solid supports or consoles, beautifully shaped and carved, often terminating in claw or scroll feet. These consoles in turn were usually connected by a heavy stretcher. Smaller supports, in the form of an arcade, sometimes rest on this shelf or stretcher.

The development of architecture and an improvement in furniture design go hand in hand. John Addington Symonds, the great historian of the Renaissance, gives a summary of the advance and development of architecture from which we may gather some idea of the spirit which prompted the advancement of art during the Italian Renaissance period. He says:

"Three periods in the development of Renaissance architecture may be roughly marked. The first, extending from 1420 to 1500, is the age of experiment and of luxuriant inventiveness. The second embraces the first forty years of the sixteenth century. The most perfect buildings of the Italian Renaissance were produced within this short space of time. The third, again comprising about forty years, from 1540 to 1580, leads onward to the reign of mannerism and exaggeration, called the Italian barocco. In itself the third period is distinguished by a scrupulous purism bordering upon pedantry, strict adherence to theoretical rules, and sacrifice of inventive qualities to established canons. To do more than briefly indicate the masterpieces of these three periods would be impossible in a work that does not pretend to treat of architecture exhaustively; and yet to omit all notice of the buildings of this age and of their styles, would be to neglect the most important art-phase of the time we have undertaken to illustrate.

The various forces and influences which determine the divisions of the Renaissance into these periods need to be understood to explain the advances made throughout them and Symonds is once again our helper.

"In the first period we are bewildered by the luxuriance of creative powers and by the rioting of the fancy in all forms of beauty indiscriminately mingled. In general we detect a striving after effects not fully realized, and a tendency to indulge in superfluous ornament without regard for strictness of design. The imperfect comprehension of classical models and the exuberant vivacity of the imagination in the fifteenth century account for the florid work of this time. Something too is left of mediaeval fancy; the details

Power

Dignity

borrowed from the antique undergo fantastic transmutation at the hands of men accustomed to the vehement emotion of the romantic ages. Whatever the Renaissance took from antique art, it was at first unable to assimilate either the moderations of the Greeks or the practical sobriety of the Romans. Christianity

Grace

had deepened and intensified the sources of imaginative life; and just as reminiscences of classic style impaired Italian Gothic, so now a trace of Gothic is perceptible in the would-be classic work of the Revival. The result of these combined influences was a wonderful and many-featured hybrid, best represented in one monument by the facade of the Certosa at Pavia. While characteristic of the work of the earlier Renaissance as fused of divers manners, we must not forget that it was truly living, full of purpose, and according to its own standard sincere. It was a new birth; no mere repetition of something dead and gone, but the product of vivid forces stirred to original creativeness by admiration for the past. It corresponded, moreover, with exquisite exactitude to the halting of the conscience between Christianity and Paganism, and to the blent beauty that the poets loved. On reeds dropped from the hands of dead Pan the artists of this period each in his own sphere, piped ditties of romance.

"In no other style than this of the earlier Renaissance is the builder more inseparably connected with the decorator. The labours of the stone-carver, who provided altars chased with Scripture histories in high relief, pulpits hung against a column of the nave, tombs with canopies and floral garlands, organ galleries enriched with bas reliefs of singing boys, ciboria with kneeling and adoring angels, marble tabernacles for relics, vases for holy water, fonts and fountains, and all the indiscribable wealth of scrolls and friezes around doors and screens and balustrades that fence the choir, are added to those of the bronze-founder, with his mighty doors and pendent lamps, his candelabras sustained by angels, torch-rests and rings, embossed basements for banners of state, and portraits of recumbent senators and prelates. The wood-carver contributes tarsia like that of Fra Giovanni da Verona. The work in wrought iron welds such screens as guard the chapel of the Sacra Cintola at Prato. The Robbias prepare their delicately-toned reliefs for the lunettes above the doorways. Modellers in clay produce the terra-cotta work of the Certosa, or the carola of the angels who surround the little cupola behind the church of St. Eurstorgio at Milan. Meanwhile mosaics are provided for the dome or let into the floor, agates and marbles and lapis lazuli are pieced together for altar fronts and panellings; stalls are carved into fantastic patterns, and heavy roofs are embossed with figures of the saints and armorial emblems. Tapestry is woven from the designs of excellent masters; great painters contribute arabesques of fresco or of stucco mixed with gilding, and glass is colored from the outlines of such draughtsmen as Ghiberti.

"In the second period the faults of the first group of Renaissance builders were in a large measure overcome, and their striving after the production of new yet classic form was more completely realized. The reckless employment of luxuriant decoration yielded to a chastened taste, without the sacrifice of beauty or magnificence. Style was refined; the construction of large buildings was better understood, and the instinct for what lies within the means of a revived and secondary manner was more true.

"Michael Angelo forms the link between the second and third periods of Renaissance. Among the architects of the latter age we have to reckon those who based their practice upon minute study of antique writers, and who, more than any of their predecessors, realized the long sought restitution of the classic style, according to precise scholastic canons. A new age had now begun for Italy. The glory and the grace of

Charm

the Renaissance, its blooming time of beauty, and its springtide of young strength, were over. Strangers held the reins of power, and the Reformation had begun to make itself felt in the Northern provinces of Christendom. A colder and more formal spirit everywhere prevailed. The sources of invention in the art

Excellent Displays of Canadian Furniture

1921 Furniture Exhibitions in Advance of all Previous Efforts—Attendance Satisfactory but Buying Inclined to be Light—Brief Outline of General Conditions

By R. G. Wells

The most pretentious display of furniture ever made by the furniture manufacturers of Canada, was shown at the exhibitions held in Toronto, Kitchener, Waterloo and Stratford, Jan. 10th-22nd. The pieces on view comprised the choicest products of a large number of factories and represented the best work of the Canadian furniture manufacturing industry.

Some 90 manufacturers of furniture and furnishings outdid themselves in their efforts to better the displays made on former occasions. Not only were the different pieces shown to good advantage, but a touch of home was imparted by the inclusion of floor and table lamps, books, attractive hangings and floor coverings. Nor was the festive and social side of the occasion overlooked, as the exhibitions were marked by banquets and dinners, at which good fellowship reigned, and other forms of social festivities. The displays were divided up as follows: about 50 showing at Toronto, 32 at Kitchener-Waterloo, and 8 at Stratford.

Many Dealers in Attendance

The exhibitions have been open only four days at this writing, so that it is a little too early to give a clear indication of the results accruing. A fairly satisfactory number of retailers have visited the different centres, examined the displays and talked with the manufacturers present, then wandering along to the next centre. As yet the buying has been light, and while the volume of sales made, total up to a considerable figure, the purchases made have been more in the nature of sorting-up orders, than an evidence of a general resumption of buying.

The manufacturers are all more or less optimistic. They realize that the natural tendency is for the dealers to look around, visit the different centres where the exhibitions are being held and compare designs and values, before placing their orders. This is happening. Some of the visitors will double back and place a few orders, while others will return home, and the travellers will reap the benefit when they call.

Optimism Well Founded

There is every reason for optimism. The retail trade enjoyed a good volume of business right up to the close of 1920. At the present moment their stocks are low, so that it is only a question of time before they will be forced to replenish their depleted floors. There is no doubt that they were overstocked last fall, which accounts for the fact that the manufacturers could not secure any business toward the close of the year. The reason the dealers are not buying freely now, is partly psychological and partly due to the fact that they have been looking for marked reductions. Now that they have seen the new lines, learned the prices that will prevail for the next few months, have talked with the manufacturers and have been assured that no further reductions are possible or contemplated, they should return home convinced of the fact that furniture values have reached rock bottom for the present at least.

Well Worth While

Even though the total sales made during the two weeks the exhibitions are open, should be disappointing, the fact that the retailers were afforded an opportunity to see the newer lines, learn, first hand, the prevailing prices and discuss conditions with those in the manufacturing field, should result in the dealers departing with a renewed confidence in the furniture industry, and first-hand information on which to base plans, and the establishment of a closer bond between retailer and manufacturer, and thus repay the manufacturers for the time, energy and money expended.

A meeting of the Retail Furniture Dealers' Association was held in Toronto, Friday Jan. 14th. In this connection the furniture manufacturers entertained the dealers at a banquet in the King Edward Hotel. About 400 guests were present, including retailers, manufacturers and their representatives, and representatives of the trade and daily press. The dinner was followed by an entertainment, interspersed with speeches and toasts. The crowning event of the evening was a fast 6 round bout between the amateur feather and bantam-weight champions of Canada. This number was a complete surprise, as it was not announced on the programme. It was put on in a novel and interesting way.

Thos. Bell, Southampton, Ont., veteran furniture manufacturer, who received ovation at banquet in Toronto. Been manufacturing since 1868.

Splendid Spirit Shown

The keynote of the evening was optimism, co-operation and good fellowship. If the spirit and vision displayed at this banquet is carried out into everyday business transactions, there is no doubt as to what the next few months hold in store for the furniture industry. James Acton, of the Acton Publishing Co., Toronto, occupied the chair, while F. E. Coombe, G. O. Luke, T. E. Simpson, Clarence Coryell, J. R. Shaw, H. P. Sullivan, Wm. Cawkell and James E Ferguson were the speakers of the evening. A most enjoyable and instructive time was spent by all.

In addition, the Retail Furniture Dealers' Associa-

tion are scheduled to meet in Kitchener Jan. 18th and in Stratford, Jan. 21st. This should bring a large number of visitors to these different centres. It is fully anticipated that the closing days of the exhibition will see a large number of retail dealers in attendance and that a considerable amount of business will be transacted.

Prices on nearly all lines show a slight downward tendency. Each article was priced with regard to present conditions and replacement values. While the reduction is general, it varies in each piece, as different articles are effected by reductions in costs of different materials.

"The Lumber Business"

One of the brightest, most interesting volumes that has come to the editorial desk in a long time is a small book entitled "The Lumber Business" from the able pen of W. M. Ritter, of the W. M. Ritter Lumber Co., Columbus, Ohio. He deals with the lumbering business under three headings—organization, production and distribution. If space permitted many forceful and interesting extracts could be quoted. A few shorter suggestions are: "The ability to think accurately is the greatest business faculty a man can have," "Efficiency is doing the right thing, in the right way, at the right time,' all the time," "Managers are judged by the men they make," "With ability to think, to imagine and to remember, a man will succeed unless he deliberately prefers not to do so."

Buying Light at Grand Rapids

The exhibition held at Grand Rapids Jan. 3-22, was disappointing, judging from the amount of business placed, although the volume of scales and the number in attendance compared favorably with the January markets of 1915, 1916 and 1917. The attitude of the salesmen is that they will secure many orders, when on the road, as a result of this display. The many unfounded rumors in circulation tended to retard buying. These rumors could not be confirmed and in the face of such absurd statements, there was a strong determination exhibited on the part of manufacturers, not to sell goods at a loss. A majority of the case goods manufacturers have closed their plants but it is expected that most of them will reopen Feb. 1st. The general feeling was that the financial uncertainty is at an end, the future assured and that there will be a gradual resumption of buying.

Large Quantities of Pencil Cedar

Though incense cedar is not a rare wood, pencil manufacturers and cabinet makers have difficulty in keeping a sufficient quantity of this material in stock. It is estimated that there is a supply measuring eleven billion feet in this country, of which ten billion is located within the boundaries of California. The trouble is that the heartwood of incense cedar is commonly honey-combed by a dry rot which makes a large part of it valueless for timber. On account of this, experienced lumbermen frequently reduce estimates by 30 to 50 per cent. It costs as much to cut and bring to market a diseased tree as a sound one, and lumbermen hestitate to work with a wood which gives such a large average loss.

Dr. John S. Boyce of the Bureau of Plant Industry, United States Department of Agriculture, has finished a very complete study of this dry rot of incense cedar. The results as published in Department Bulletin 871, "The Dry Rot of Incense Cedar," show that a change of methods of marking and bucking—that is, designating what trees are to be cut, estimating the amount of timber that is in the trees, and sawing the timber into log lengths—will ultimately materially alter the status of this tree—that sound trees and logs can be distinguished from decayed.

Eat and be merry tonight for tomorrow we work.

GOD SAVE THE KING
Lyrics by Clarence Cory-yell
and the 2 Bards—Gib and Gil

Menu and programme, banquet tendered retail furniture dealers in convention in Toronto, by the furniture manufacturers.

A well planned residence with interesting features. Description appears below. Harold R. Watson, Toronto, was the architect.

Problems Involved in Designing House

Attractiveness Not Sacrificed to Utility—Making Most of Site and Surroundings—Special Attention to Kitchen

By D. A. Reddin

IN CHOOSING a plan or design for a house there is more to consider than the general appearance of the structure and the size, number, and location of the rooms. The size, shape and location of the site, the general style and value of the surrounding homes and the views of vistas with which the property is surrounded should have every consideration. In fact, if such details are not taken into account, it is not possible to make an intelligent selection of a plan or design and the result may or may not be satisfactory.

The illustrations which accompany this article show a residence designed by Harold R. Watson, architect, Excelsior Life Building, Toronto. Mr. Watson, who specializes in residential work, is very much in love with his work, and simply delights in taking a piece of ground and not only designing an attractive house that fits becomingly into the setting, but in endeavoring to take full advantage of all the possibilities which may be found in the site and its surroundings to the lasting satisfaction of the owner. In this he is unusually successful.

Special Problem to Overcome

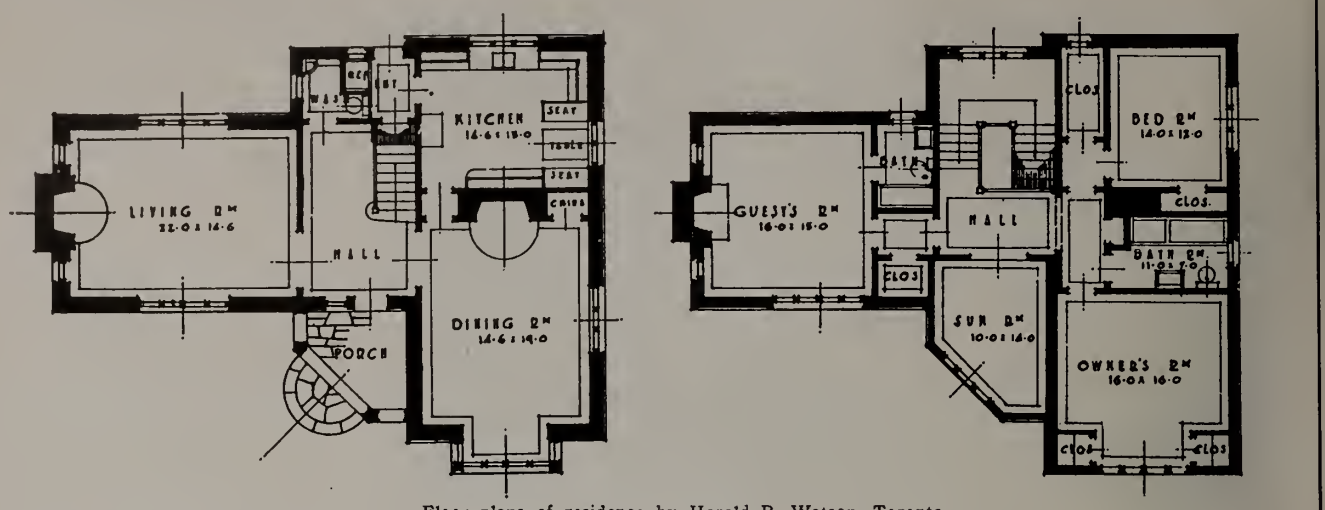
In this particular instance the problem was to work out an attractively designed home on an irregularly shaped lot, in which the location, and to a certain extent the house itself, was more or less controlled by a garage which stood on the rear of the lot. This accounts for the unusual shape and layout of this home. In the arrangement and size of the rooms is manifest the modern tendency toward a minimum number of rooms of generous proportions, in preference to a larger number of smaller rooms.

Another feature that was given careful attention was the convenient layout and arrangement of the rooms and fitments. This is particularly noticeable in the kitchen, which is practically lined with shelves and cupboards, enabling the pantry to be dispensed with. At either end of the sink, which faces a window, is found a covered tub. When not in use, the covers form draining boards for the sink. The breakfast alcove, placed in the kitchen, is another attractive, step-saving feature. Everything in this department is so planned and arranged that the work may be carried out in a minimum time and with a minimum expenditure of energy. The kitchen is trimmed in pine enamelled white.

Special Attention to Woodwork

The interior woodwork is well planned and executed. The living room is finished in quartered white oak, with beamed ceiling and deeply recessed win-

Dining room with Elizabethean panelling in quartered white oak



Floor plans of residence by Harold R. Watson, Toronto

dows. The dining room is panelled, in Elizabethean style, to the height of the window heads. Provision was made above the fireplace for a mural painting. Here again quartered white oak is the wood used. The same wood is employed in finishing the entrance hall.

The lower floor contains large dining and living rooms, kitchen and convenient wash room. On the upper floor is found a self-contained guests' apartment, with separate bath, two bedrooms, sun room, together with numerous closets. This floor is well arranged, waste space having been reduced to a minimum.

The half-timbered effect of the porch and sun room add considerably to the attractiveness of the exterior of the house. These timbers are of adzed pine and are held together by oak pins. The window frames are constructed in the same manner. The shingle roof is in keeping with the general feeling of the house, as are the quaint old Elizabethean or Tudor chimneys.

Scarcity of Mahogany

"There is a pronounced scarcity of mahogany along the West African coast this year, because of lack of sufficient rain to float the logs down the streams," said R. P. Sawyer, of Palmer & Parker, Boston, dealers in lumber and mahogany, who recently arrived from the Gold Coast, arranging for shipments of that commodity.

"Our company handles about 6,000,000 feet of mahogany a year, but this has been a very unfavorable year to get wood from West Africa. Because of the scarcity, there has been competition among buyers, forcing prices up. Mahogany logs are now costing £50, as compared with £8 and £10 before the war, and about £6 during the war. Logs average between between 1½ and 2 tons, the heaviest running up to 8 tons. Present average price is about £25 a log. In 1913, between 30,000 and 40,000 logs were brought down on the Gold Coast. The labor situation is bad, since the natives are not obliged to work.

"We are bringing over what is believed to be one of the largest cargoes of mahogany ever loaded, 2,000,000 feet, which will be docked at Boston."

During the first eight months of 1920, 31,775 million feet of mahogany, valued at $4,675,745, came into the United States. For the same period in 1919, the amount was 29,032 million feet, valued at $2,387,-907; and for the same period in 1918, 27,033 million feet, valued at $2,106,187. While total imports of mahogany for the first eight months of the current year showed a slight increase over the previous year, the value was increased almost 100%.

Spirit of Italian Renaissance Furniture

(Continued from page 72)

of painting were dried up. Scholarship has pined away into pedantic purism. Correct taste was coming to be prized more highly than originality of genius in literature. Nor did architects fail to manifest the operation of this change."

Another writer deals with the furniture of that period as follows:

"The Renaissance raised furniture making to an art. Pupils were aprenticed to master and studied with him until they had perfected their craft, when they opened workshops of their own. The pieces produced in these great studio-shops united beauty with utility. For the first time designs were made with reference to their setting. The furniture of the private dwelling was suggestive of neither cathedrals nor abbeys. It was made with a careful regard for the needs of the owner, his station and manner of living. Thus houses possessed a harmony which had hitherto been absent.

"Two pieces of furniture which assume an important place in the late seventeenth century were unknown in the early Renaissance house, and these were the bookcase and the writing desk. Bookcases, in the earlier period were made exclusively for the great libraries of Italy, and writing desks were the property of monks and scribes. In the Museum of St. Mark in Florence, is exhibited the desk used by Savonarola. It has not a line of decoration, a scrap of carving. The monks ornamented their chairs and benches, but their desks were as severe as their lives. Savonarola's desk is beautiful in its straight lines and plain surfaces, and aside from its connection with the great Dominican, has value as a piece of Renaissance woodwork."

What of Wages in Woodworking Industry?

Should Labor Bear a Share in Placing Business on a Sound Foundation by Accepting Lower Wages?—Industry Should Act as a Whole—Read the Opinions of Prominent Woodworkers

The responsibility of labor is engaging the minds of many large employers. The prices of many commodities are falling and new low levels are being struck; what proportion, if any, of this decline should be accepted by the working man. In bringing the problem home to the woodworking industry it must be favorably admitted that exorbitant prices and inflated values were not common in this line of endeavor. Yet lower prices must prevail; are necessary to stimulate building and increase the demand for all wood products.

Should the employees in the different woodworking plants shoulder a part of the responsibility by accepting a lower wage? Would it be to their advantage, inasmuch as it might mean steadier work and less unemployment? Would lower values result in more business? How do the rates paid woodworkers compare with those in other industries? Are they too high? Would they stand to be reduced, present living costs considered? What scale is being paid in your district and what is your policy toward the wage question?

Whatever the attitude taken the industry should act as a whole. If some employer put lower rates into effect while others maintain the present scale, it tends for uncertainty, competition for mechanics and lack of uniformity in prices and quotations. With this in mind some of the above questions were put to a number of woodworkers. Their replies are printed below. Read them, give the subject a little thought, and send in your views for the February issue.

* * *

Maintain Present Level

What one representative Ontario woodworker has to say: "In reply to your question, are lower wages to prevail? We take pleasure in submitting the following: 1st., they should not. 2nd., they may and probably will in the future. 3rd., on what do we base these assumptions.

"In making the assertion that wages should not be reduced, it must be distinctly understood that we are dealing entirely with the woodworking industry. In this line we have no reason to believe that there has been any exorbitant advance in wages. It is a question if the purchasing power of the wage dollar has kept pace with the selling price of the article produced. Whilst there has been a reduction in the wholesale and retail price of a good many commodities, in most cases any surplus of wages accumulated in the woodworking industry will be absorbed in the procuring of goods necessary to replenish depleted stocks of household requirements. Unemployment will also bear heavily on any surplus saved, and the workers through decreased earning capacity are not in a position to take advantage of reduced prices.

"The general welfare of all communities should be the prime aim of both employer and employed. During the last two years, more particularly, the great demand has been for greater production. This, judging by present day conditions must have been in a large measure complied with, as surplus stocks in many lines exist in abundance. There is little use in urging greater production and at the same time advocating measures which deny to many the opportunity of buying necessary commodities.

"Referring to the statement that wages may and probably will be reduced in the future, this is in keeping with what seems to be the general trend of commodity prices. Should drastic reductions take place, and goods be cheaper and with employment more plentiful, then when this fact is firmly established will be time enough to adjust wages in keeping with such conditions. There has been altogether too much emphasis placed on the wage cost of production or conduct of business.

"Where it has been frankly admitted that a 300% profit was made in woollen goods, etc., and wages were not extravagantly high, whilst we do not even assume that such conditions are general, the fact remains that in too many instances, stressing the point of extravagant wages has had a most injurious effect on both the thinking and thoughtless workers.

"The basis for maintaining that wages should not be reduced at present, but that in the future they may, is simply this. At present as far as we know woodworkers are not overpaid, and in fact have, as a rule, in the past been underpaid. Our rates of wages are at present as follows: machine operators 55 to 65 cents per hour, boys and machine helpers 30 to 45 c., bench men 55 to 60 c., yard and general help 48 and 50 c., department foreman, 65 to 90c. per hour.

"In presenting the case concisely, we may say that in the best interests of the woodworking industry as a whole, and from the viewpoint of the employer, and employed, we are fully convinced that for the purpose of mutual benefit and lasting results there should be no action taken at present toward the lowering of wages. We feel sure that where an inquiry, in sympathy with decent requirements is made, it will be shown quite plainly that those engaged in the woodworking industry are not receiving much if any more than what is generally termed a living wage. In fact many of them instead of being profiteers are financiers in the best sense of the word. Whilst in a large measure we have an obligation to our business, and the community, we also have a large responsibility in the matter under discussion.

"Whatever action is taken if we all play the game fairly, and with mutual understanding, we need have no fear of the future."

* * *

Lower Rate to Prevail

How a Nova Scotian views the question: "We have your favor of the 4th, asking for an expression of opinion as to wages applying to this industry. The writer's opinion is, that a reduction of say 10% should become effective immediately. As a matter of fact, we expect to make it effective in our plant on the 17th instant. The cost of living has at last started on a decidedly downward movement, and as the present rates were introduced when costs were at their peak, it is only reasonable that the workers should content themselves with a reasonable reduction. Indeed I be-

lieve such a step necessary in order to bring down building costs, and thereby stimulate construction.

"There seems to be a universal idea now prevalent with the public, that these costs must tumble, and they are therefore witholding their work until a decided reduction takes place. Work is not at all plentiful, and if costs come down, there is no doubt an impetus will be given building operations, and in order to bring this about, the workmen should be willing to do their part. The rates we are paying at present are as follows: woodworking moulder men, 67 to 80c. per hour, other machine men 45 to 67c. per hour, bench men 50 to 60c. per hour, machine and equipment repair men 40 to 60c. per hour, factory helpers, 40 to 42½c., yard men 40c., shippers, 40, 45 and 50c., and teamsters 40c. per hour.

* * *

Rate Too High in Comparison

A Kitchener manufacturer replied as follows:

1. "Are lower wages to prevail? Yes, somewhat.

2. Shall wages in the woodworking industry be reduced or maintained? Reduced.

3. Labor costs are high, yet would a cut in wages result in any increased demand for wood products, due to lower prices? A reduction in wages would have a tendency to increase the demand somewhat.

4. Are our mechanics and laborers receiving too high a scale, rates in other industries and present living costs considered? Rates in other industries and cost of living are gradually being reduced and our mechanics and laborers are therefore receiving too high a rate in comparison."

* * *

Quebec manufacturer will maintain present scale: "We employ 80 men and under ordinary conditions work an average of 10 hours per day. As business declines, my policy is not to reduce wages but to cut down the hours so as to distribute all work as evenly as possible. At the present time we are working eight hours per day

"I do not think the present moment a propitious one in which to put in force a general reduction in wages. While living costs have declined slightly, I do not consider that current prices justify any decrease in the rate paid. We are paying the following rates: carpenters, 40 to 55c. per hour, machinists 30 to 55c. per hour, journeymen 25 to 30c. per hour, boys of 15 and 16 years, 15 to 25c. per hour and teamsters 25 to 30c. per hour. This works out on an 8-hour basis to about $4.00 per day to carpenters, $3.00 to machinists, $2.40 to journeymen, $1.60 to boys and $2.40 to teamsters.

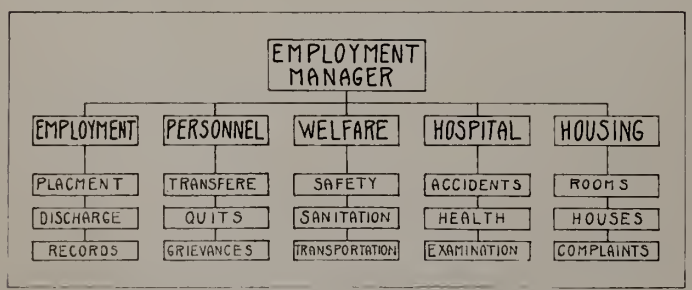
"Conditions in Quebec never reached the extremes touched in such cities as Montreal, Toronto, Halifax, and other centres. Any general reduction in wages paid to woodworkers should commence in the larger centres and gradually extend to the smaller towns. Another point is that when business is good and work plentiful, we find it extremely difficult to secure good workmen and, therefore, find it necessary to maintain wages."

Advantages of Organized Employment Dept.

Efficient Employment Manager Promotes Good Feeling—Fills Peculiar and Valuable Position—Connecting Link Between Management and Men—Authority Over Wages, Hiring and Discharging

By R. J. Waldo

At the present time when there is a surplus of labor and when every unnecessary move must be eliminated to reduce the cost of a commodity, an employment department is of vital importance to any organization. This is equaly as true now as it was during the recent labor shortage. At that time an employment department was engaged in searching for employees of the highest type available. Now they are picking out from among the applicants those who possess certain qualifications which make them of greatest value to the firm employing them.



Activities of employment department outlined.

The employment department is just as valuable now as it has been for the past few years. There are certain responsibilities which have been assigned to it that must be exercised with even greater care than during the past three years. Only a few months ago it was hire every man available and place him somewhere. Now it is hire the best men of those who apply and place them where they can render their most valuable service.

The Employment Department and Society.

The employment department renders one of its greatest services, when by carefully placing a man, it brings out the best there is in him and makes him more responsible. Making a man more responsible makes him not only worth more to the company but to the community. The man in a position of responsibility, or in a position which calls for his best efforts, feels that he must be something and that in itself makes him look at himself and determine where he may brush up and be worth more. Giving a man responsibility has often awakened a valuable talent which he never realized he possessed.

The employment department is so situated that it is often called upon to render a valuable guiding hand to the man who comes in undecided. In my experience many a man has appeared before me asking for any old thing as long as it was a job. Such men often prove valuable. In placing these men where they can develop and where they may become more responsible, the employment manager renders his greatest aid both to industry and society. Whenever you show a man that he is somebody and that you expect something definite from him which, possibly, you let him think no other man can do as well, he begins to take a new

grip on life. Many a man has taken a new grip on his life when sitting before an employment interviewer.

Even though the industrial world feels that they are not operating their plants for the benefit of society, they must admit that they are seeking the best of human endeavor, that they may reduce their price a little below the other fellow's. This has been going on in industry for years and will continue. If an organization benefits by selecting efficient men, the community benefits also. This is so because a better class of men are being educated. The industrial world also gains through increased orders.

I mention this simply to show why more care should be taken in selecting men. This can best be accomplished through the functions of the employment department.

Should Not Show Partiality.

Partiality, the cause of so much unrest in industries where there are no employment departments, is

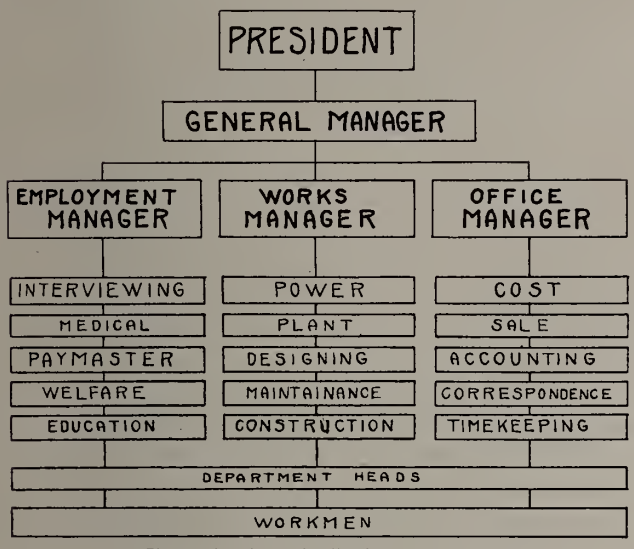


Chart showing distributions of responsibility

gradually becoming a thing of the past. Managers are beginning to realize that to have a contented force they must weigh out an equal chance to all. Many firms, and these our largest, have shown partiality to their men because they had no way of determining whether it was being done or not. At least the managers were ignorant of the fact.

The non-partial employment executive will save many a good man by his impartiality and will thus make a good reputation for his company. However, many executives will say that they do not care about their reputation among their workers. All they care about is their reputation among their buyers. Little do they believe they are the same thing. Dissatisfaction among employees has lost many a good sale among buyers.

A Disinterested Go Between.

The employment manager then becomes a disinterested go-between man and employer. He should be hired with the understanding that he must be strictly neutral. He must make all his decisions without prejudice and let nothing influence his decisions except his desire to do that which is fair and square for both man and employer. He must look squarely at the facts and even though the employee be his own son he must be ever willing to let him go if facts show it to be desirable. In my experience of hiring I have employed a foreman who at one time had laid me off. The man who hires must be able to size up a man and if his experience and capabilities warrant it, hire him.

The employment manager because of his peculiar relation to industry is in an ideal position to win the friendship of every man employed. He can often do a favor for them which they will long remember. Perhaps some employee has a friend who wants some employment of a special nature. Perhaps he has been sick and can not do hard work. Often by a word or two from the employee the hiring may be practically completed before the man calls in person.

In modern industry the employment manager must decide upon all wage increases which are made. This he must do in a strictly conscientious manner and never give a raise simply because a man wants it, but ever be ready to give a raise to any man who is worth it regardless of who he is. This wins interest and self-respect and nothing is of greater value to an employer than a man who respects himself.

Where Does Employment Manager Stand?

Just where the employment manager stands varies in different organizations. However, if he would be most efficient in his work and be of his greatest value, he should be equal to the works or office manager. However, he will do many things beyond them, yet in charting an organization the employment manager is shown on a level with them. He should have direct access to the highest officials of the company, as should each and every employee have direct access to him. To be most valuable he must be, at once, on the level with every man in the organization. He should be approachable by every man whether a sweeper or the treasurer of the company. He thus wins the respect of every worker and in turn renders a valuable service. A chart showing his place in the organization is shown in sketch No. 1.

A brief outline of the principal functions of the well-designed employment department might be advisable. Only those applicable to the smaller organization are given. These are shown in Chart No. 2. In the larger organization these may be broadened out a great deal to efficiently handle every sort of requirement that might come up.

Treating Oily Belts

It is not at all unusual to find a belt or belts that are giving trouble because oil splashings have reduced them to the consistency of oily rubber. Also is there a certain type of mechanic, whose duty it is to keep the machines running, who thinks that the very best thing to do under such circumstances is to apply lime to the belt, with a view to drying off the oil.

Granted that an oily belt will not develop the power it should, and that some form of absorbent in powder form will generally react on the oil and make the belt pull better; but in such circumstances lime is about the very last thing that should be applied. Far better is it to treat an oily belt with a non-corrosive powder, such as chalk or Fuller's earth, but even then it does not follow that this should be made a daily practice. The correct thing to do in such cases is to stop the oil getting near the belt—cover it with a guard or some other protecting device. There are very rare cases in which this cannot be done, then when the belt shows signs of becoming unduly hard, as naturally follows when all the oil is dried out of it, it is advisable to restore suppleness and pliability by applying periodically a good standard brand of belt dressing.

New Idea in Industrial Lighting

Mr. Doane Makes Startling Suggestion—Importance of Time Factor Not Realized—How Poor Lighting Retards Production—Tendency Toward Still Brighter Lighting

By S. E. Doane*

There is one new dominating thought in the industrial lighting field that I will atempt to make clear. It will be more clear if I neglect to mention other factors, such as lack of glare, uniformity of light distribution, sufficiency of shadow, etc., consideration of which time forbids.

The illuminating engineering profession is only just fairly grasping the thought that there is a time factor in seeing which is profoundly modifying our practice and our views. It may be that this society has not had presented to it, the illustrations with which the illuminating world is now familiar, which brings home to us the point which I will try to make.

How Time Factor Applies.

The opposing tennis player at twilight can see the ball in the hand of the player about to serve. The ball may become entirely invisible the minute it is put in motion. You are all familiar with the experience, but we have not applied the fact that it indicates until very recently. If we think of the tennis ball we will realize that the ball in sight before it is served and the ball in motion after it is served, is of the same color, has the same amount of light on it and if there is no time factor in sight, should be equally visible whether in motion or at rest.

The man walking along the dimly lighted storeroom may trip over or bump against something which is perfectly apparent when he stops and views it. If the man should stand still and we should put the object in motion at the same speed at which the man was progressing when he ran into the thing over which he tripped or with which he interferred, he would probably find the same difficulty in seeing it as the player does in seeing the moving tennis ball.

Like Photographic Plate.

Laboratory tests have been designed and study is progressing to put values in fractions of a second to the speed of vision under various conditions of quantity and quality of light; in amount of contrast between background, etc. The subject in the course of the next few years will be well understood but just at present our application is running ahead of our exact knowledge on the subject. It is perhaps enough to say that the retina of the human eye behaves so much like a photographic plate that if you will consider your experience in photography you will have a fair start on this problem of speed of vision. When the light is dim we make a longer exposure on our photographic plate, in order to obtain the same picture which we can obtain with less exposure when light is bright. The human eye behaves in just this way. There is ample evidence now to show that the brain receives no notice whatsoever that the picture is being recorded on the retina of the eye until the time such exposure reaches some definite value which is a function of the light intensity. The time that the eye takes under practically all conditions of artificial lighting is measurable in considerable fractions of a second. If you were photographing the tennis ball in motion, you would have to photograph it so quickly that it apparently would not have moved from the beginning to the end of the exposure. This would be impossible in dim light. In watching the flight of the ball, the human eye must do just this thing and it must sufficiently recognize the motion of the ball to keep that ball so clearly in focus in the eye that its course can be traced. This is impossible in light which is dim, although it is quite possible that the light may be strong enough to make such a photographic impression on the eye if the ball be at rest.

Retards Speed of Workmen.

Just imagine your attempting to photograph the obstacle in the warehouse over which the employee tripped, against which he walked, without hesitating, and you will see why it is that I say that this speed factor of sight is destined to become a very important factor in safety lighting.

Just one word as to the application of this new appreciation or knowledge in industrial lighting. We think of the workman at the bench, as he reaches for his pliers, hammer, file or some other tool, as merely reaching for the tool, we do not visualize him as making a mental photograph of the bench and then reaching for the tool at the spot indicated on the photograph. The facts are, however, that he does take such a mental photograph and that it takes time to make it if the light be dim and consequently instead of good lighting or high intensity lighting stimulating acuity, it should be stated that dim light is a barrier or a brake on acuity which brighter lighting removes wholly or in part.

Many factors enter into this better lighting programme. It is more than ever obvious that glare is a greater detriment and more objectionable than we had imagined. It is also entirely obvious that the contrast between light and shadow by which objects are defined, is a much more important thing than we would imagine. If your mind is not clear as to this, think again of your camera and how you would photograph or how you would like to photograph.

More Light Required.

I just suspect that each one of you is saying, how brightly should we light our work shops. I will forestall your question by saying, we do not know, we have never yet so brightly lighted any shop that the owner, superintendent or foreman agreed to have it less brightly lighted. We are gaining courage as the months pass and know now that if we had had the courage of our conviction a year ago we would have lighted much more brightly than we did then and it may be that a year hence we will light much more brightly than we do now.

As an interesting indication of our progressing thought I will instance; one of our machine shops which we considered sufficiently lighted and which was lighted at an intensity of twelve foot candles four years ago, has recently moved to a new location. We lighted the new plant at twenty-five foot candles.

*Address, New York Section, Illuminating Engineering Society, New York.

Why Are Electric Installations on Increase?

More Interest Being Taken in Motor Drive—One Manufacturer Says Cuts Fuel Bill in Two—Takes Care Surplus Power Requirements

By P. E. Poole

A representative of one large manufacturer of electric equipment recently made the statement that his company sold a larger number of motors to woodworkers and furniture men during 1920 than ever before in the history of their organization and that they anticipated increasing their sales in this field during the next twelve months. Why are electric motors so popular? Are they superior to any other form of drive? If they have any special advantage over steam equipment or if the adoption of the motor drive will enable any woodworker, not using electric power, to cut down his overhead expenses, increase the efficiency of the plant, and save money, the "Canadian Woodworker" believes that information on this subject will be read with interest. To this end articles dealing with different phases of the electric drive, as applied to woodworking plants, are scheduled to appear in the next few issues.

Probably one of the most potent reasons why the woodworking industry is turning toward the electric drive is the ever-present possibility of a coal famine and the high prices which this commodity commands. During the winter of 1920 coal was scarce and at a minimum and many manufacturers were faced with the possibility of having to close their plants, due entirely to their inability to secure an adequate supply of fuel. This experience may have caused many to consider electricity as a source of power. However, there are certain advantages and economies, which go hand in hand with the motor drive, which have a strong appeal to all practical men.

Some of the Advantages

With an electric installation, where two or more motors are connected up, a more even distribution of power is secured. That is, motors may be placed where the power consumption is heaviest, doing away with many of the losses common to line-shaft and belt transmission. Thus the adoption of the group or individual drive effects a direct saving in the amount of power consumed, owing to the complete or partial elimination of transmission losses. Another feature is that with the group drive, one motor driving a limited number of machines, the groups may be operated as independent units. If one group is not in operation there is a direct saving of power. This is particularly advantageous when work is a little slack.

Just a word about the different drives. There are three types of electric installation—individual, either direct connected or belted, group and unit drive. In the latter type one motor provides power for the whole plant, which is distributed through the usual transmission system. The individual drive is the most efficient, but is also the most expensive to instal. The manufacturers of woodworking equipment have shown their appreciation of the direct connected electric drive by designing special machines, such as saws, moulders, shapers, etc., in which provision is made for attaching a suitable motor. The idea has been carried even further as in some instances the different spindles are each made part of motor rotor and the motor becomes an integral part of the machine.

Would Not Revert to Steam

The views and opinions of a few woodworkers, who are using electric power should be of interest. One operator of a large planing mill, when approached on this question, had this to say: "It is the only power when you can get it at a reasonable price. We use 53 h.p. which costs us on an average of $90.00 per month. You will see that you could not hire a man for this and the wear and tear on a motor as compared with a boiler and engine is nil. With electric power the motors can be so placed that they will give the maximum service. We have been using this power for over 20 years in our planing mill. Previous to that steam, but would not go back to steam unless compelled to for the lack of electric energy. At the present moment we are operating 5 motors, totalling 53 h.p.

"Disposing of the shavings is certainly a big item. We firmly believe they can be converted into a good paying proposition just as well as rags and waste paper. Why not the "Canadian Woodworker" start the ball rolling, by encouraging some one with a little capital to collect the shavings and waste from planing mills and convert it into alcohol or pulp. We are of the opinion that a large proportion of the planing mills are operated by electricity. For some enterprising person, or company, to collect the waste and bring it to one centre and there convert it into something valuable, should be a paying proposition. It does seem to us a great waste and needless expense to, in our rush season, to have to draw them to the dump, for generally in that season one cannot dispose of them baled. We have installed a baler but find it very difficult to sell them."

Cut Fuel Bill in Two

Several furniture manufacturers were asked for their opinions and experience with electricity as a form of power. One furniture maker in Western Ontario, who recently put in a number of motors, has this to say: "We have just installed a group drive of seven motors, comprising 240 h.p. As the installation has been but recently completed, we cannot as yet give you any figures, but there is no doubt but what we are receiving excellent results. We have purchased all new equipment, and the machines perform beautifully. The drive is so arranged that we can hook up our steam in one hour, should something unforeseen happen to the power line.

"There are many advantages in a motor drive. For instance, we can run any group in our plant separately, and in quiet times, which we are experiencing just now, this makes a big saving in the power bill. We have a separate motor running the shavings fan. This refuse goes direct to the boiler where it is used for heating purposes, and drying lumber in our kiln.

"Regarding the financial end, which is most important, the amount of power we use, we expect, will cost us at the rate of steam coal at about $6.00 per

ton, a figure we never expect to see again. Of course against this is the first cost of installing the motors, but we are satisfied that we can cut our fuel bill in two and have a much more satisfactory drive, and there is no doubt but that Hydro rates will decline in the near future, giving us an additional advantage.

"We should impress on any woodworkers who contemplate installing motors, to be sure and purchase machines of ample capacity so that the motors will not be overloaded and thus retard their proper performance. A motor that is overloaded will consume more current than a machine of ample capacity. We, in our plant, took the peak load of all of our machines, and purchased motors to do the work in groups according to required h.p. as shown by these tests."

Supplement Steam Installation

It is sometimes argued that a plant requiring steam for heating and drying purposes, would find it more economical to operate on steam power, using the exhaust for heating and drying purposes. This might hold true if sufficient waste material were produced to supply the fuel requirements of the boilers. Where the amount of shavings and waste produced must be supplemented with coal, the power generated from the coal costs more than a similar amount of electric energy. That being the case, it would appear that the logical solution would be to operate a steam plant of sufficient capacity to provide only the amount of exhaust steam required to heat the plant and kiln and to instal motors to take care of all power requirements in excess of the capacity of the steam plant.

This is the policy by one successful woodworker who says: "The way we are situated, electric power is a convenience to us, but the nature of our business makes it necessary for us to operate a steam plant, as we require steam for dry kilns, plant heating, etc. By utilizing the live steam for power and the exhaust for heating our factory and kilns the steam plant uses up most of the factory refuse, so we have no difficulty in disposing of this waste. We use electric motors to drive isolated machines that cannot be conveniently connected up to the line shaft with belts and also to furnish the power we require beyond the capacity of our engine."

Cross Arms From B. C. Fir

The woodworking plant of Wm. Shirton & Co., Dunnville, Ont., presents a very busy appearance at the present time. This industry is an old-established one and employs from 15 to 20 men the year round. Wm. Shirton, the founder of the business, died about 12 years ago, and it has since been ably conducted by his son, K. J. Shirton, who is one of the most enthusiastic members of the Ontario Retail Lumber Dealers' Association.

The district in and around Dunnville is a great natural gas one, and some five years ago Mr. Shirton sank a gas well. The depth is 800 feet. A 6-inch pipe goes down 500 feet into a pocket of 250 feet depth. Until the latter part of 1919 natural gas was used for driving the equipment of the mill but now a 25 h.p. Westinghouse moto is employed and the gas engine is kept as an auxiliary in case anything should go wrong with the hydro-electric power. Natural gas, however, is used for heating the building and offices of the firm.

Mr. Shirton has a large contract with telephone and telegraph companies for the supplying of cross-arms, which are made from B. C. dimension fir. In regard to cross-arms for telegraph and telephone poles, he says that his company uses B. C. fir almost exclusively. Roughly speaking, the size that they employ to the greatest extent is 3¼ x 4¼ finish measurements, although they manufacture a small quantity of 3 x 4 and occasionally 3¾ x 4⅜. They will furnish about 60,000 cross-arms this season and state that this business for 1920 has not been in excess of the normal output.

Continuing, Mr. Shirton says: We have been in the cross-arm business for about fifteen years and are quite well established, although it has been rather a slow process to build a up a trade in this particular line. We do not hesitate to state that B. C. fir is, in our opinion, the most suitable wood to use for the purpose, although long leaf Yellow Pine is a very close second. We believe, moreover, that all other things being equal we should give our Canadian firms this business and are resolved to adhere to the former wood as long as it is procurable at anywhere near the price of the American product. Norway pine, although light in weight as compared to Georgia pine, is very often too knotty thereby imparing the strength. Otherwise this wood compares quite favorably with both fir and Georgia pine.

Andrew Malcolm, Vice-President, Andrew Malcolm Furniture Co., Limited, Kincardine and Listowel, Ont.

Furniture Manufacturer as Mayor

Andrew Malcolm, Listowel, Ont., vice-president of the Andrew Malcolm Furniture Co., Limited, of Kincardine and Listowel, Ont., was elected mayor at the civic elections recently held in Listowel. Mr. Malcolm, who is a son of the late Andrew Malcolm, founder of the firm, has resided in Listowel for the past eight years, being in charge of the Listowel factory. He has always taken a great interest in public affairs and has served on the Hydro Commission of Listowel for six years; in fact it was largely due to his efforts that the Hydro power was linked up to Listowel. Mr. Malcolm served as councillor during 1920 and, as stated, has now been returned as mayor. In this connection it might be mentioned that he polled the largest number of votes ever cast for mayor in any municipal election in Listowel.

How Fred Barraclough Keeps Costs

Planing Mill Operator Has Worked Out Simple System—Knows Exactly What Each Job Costs—Information Secured Invaluable as Basis of Estimating

By H. A. Rolphe

What a boon it would be to the woodworking industry; what a boost for greater efficiency, if every member were to keep accurate account of his overhead and costs and base his estimates and prices on the cost of production. When one considers the many advantages to be derived from knowing costs, it is hard to understand why some simple method of cost finding is not in general use.

If the operator of every planing mill or sash and door factory knew the exact cost of each job turned out, he would take pains to make sure that profit was forthcoming on every item, and more than that, the experience gained and figures compiled on work completed, would serve as a valuable guide when estimating new work. Thus to a certain extent blind, cut-throat competition would be eliminated, for the average man would hesitate a long while before quoting a figure or accepting work at a price below what it would cost to turn it out. It is the person who does not know his costs, who guesses blindly at prices, and who thinks he can do work as cheap as, and even cheaper than, his competitors, who plays havoc with prices and is responsible for a continued feeling of uncertainty within the industry.

Cayuga Planing Mill Co.

Mr. Tom Smith Date May 30th 1920

June 30th (When Wanted) Cayuga (Address) 66 (Phone No.)

Order No.	DESCRIPTION
6	1 = Counter & Fixtures as per Drawing

Tom Smith

Form "A" used upon which all orders are entered.

Alive to Advantages of Accurate Figures

Fred Barraclough of the Cayuga Planing Mill Co., Cayuga. Ont., does not do any guessing as to his costs, neither does he leave anything to chance. He has given this question close study and has evolved and installed an efficient cost system of his own. He knows exactly what his overhead charges are and how they should be distributed, the average daily or weekly production of each man in his employ and the exact charge to make per hour for bench and machine work. Armed with this information he does not find it necessary to guess that the price for a certain piece of work will be "around" a certain figure or "about" so and so, but is able to state positively that it will cost so much and knows when making such a quotation that he will make a fair and satisfactory profit.

The Cayuga Planing Mill Co., conduct a general woodworking business consisting of hardwood flooring, interior woodwork, sash and doors, odd job work and general sawing. When a customer comes in or when an order is placed, the order is taken down on form A., and which, as far as possible, is signed by the purchaser. This order form gives such information as particulars of job, when wanted, name and address of purchaser, phone number, if any, and order number. A duplicate copy is given to the customer.

Close Tab on Workmen's Time

Form "B" is the workman's time sheet or ticket. The mechanic fills out the order No., name of job and accounts for all his time on this form. In the sample shown he spent 3½ hours bench, on order No. 6, 3 hours machine, order No., 10, ½ hour oiling equipment

and 1 hour, shop, fixing belts and other unproductive work. Thus no matter on how many different jobs on which a man spends time, a full accounting is made. Entries are made from the time tickets into cost book, form D., and also into time book. That means that an accurate account is kept of all time expended.

The form "D." which is in reality a page from the cost book, except that two headings "rough" or finished" are omitted. This book is similar to a ledger, index and all. The form is self explanatory. With it one is able to keep track of each job and of each item entering into each order.

Time and Material Work

Describing Form D, Mr. Barraclough says:—"The job shown on Form D was one that we took to make. We agreed to do it for whatever it cost on a basis of material and 85 cents per hour for bench work and $1.30 per hour for machine work. I showed the customer how I would keep track of same, to which he replied he did not think it could be fairer and that I would be getting a reasonable profit and him a fair price. We get a lot of these kind of jobs. About the only fair and sure way of doing them is by the hour and, by this system, it has been no trouble to me to keep track of everything. While help has been scarce and I have been at the bench myself, I have let things go for a few days without entering up, but my day cards were there, and I could carry out the task in short time."

The remaining form "C," is a stock sheet or stock bill, upon which the workman enters all material as he gets it. This sheet gives a lot of valuable information, such as the amount of material, kind of stock, rough or dressed, grade, from where secured—the racks in the storage shed are all numbered and the workman is required to give the number of the rack from which he takes the material. The material in each rack is entered in the stock book and the material withdrawn is checked off from the material bill, so that in reality it enables a perpetual inventory to be kept as well as keeping close tab on all work. "Mill" is where all the finished material is stored. As the workman enters his time on this sheet as well as on the time tickets, it constitutes a double check on the workman's time.

Application of Burden

One can readily see that the information secured from these forms together with a proper allowance for overhead, would give the exact cost of each job. Overhead would include such expenses as office and managing, unproductive work in factory and yard, charges for insurance, taxes, depreciation, interest, etc.

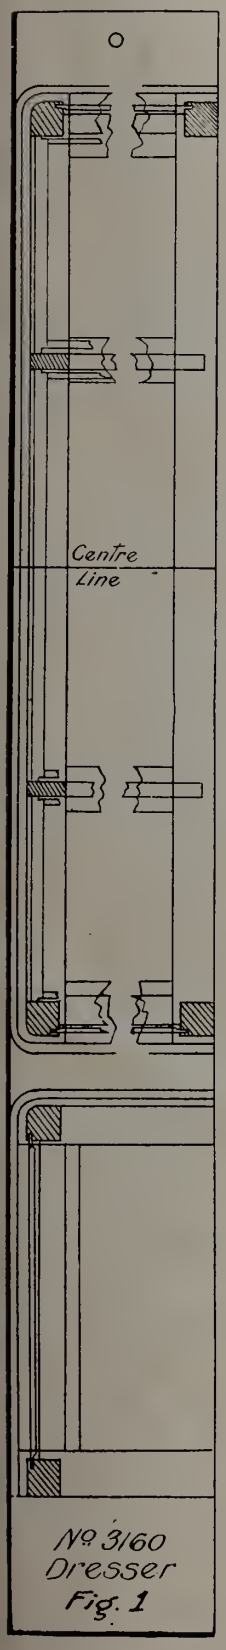
Can You Make "Rod" Showing All Details?

Ability to Read and Make Rods Valuable Asset—Suitable for Furniture, Phonographs, Show-cases and all Forms of Cabinet Work—Try These Suggestions

By H. B. Beattie



A working drawing on heavy drafting paper seldom survives one run through the factory. I do not mean by this that a drawing is totally unfit for further service, but it is certainly contracted and defaced owing to the paper being creased and otherwise mishandled during the process of machining the piece of furniture it represents. Invariably a splash of tobacco juice adorns its margins. I have even known an important detail to be entirely obliterated owing to the user "shooting short" in putting a barrage over on the spitoon. Then some careless oiler, in oiling loose pulleys on counter-shafting, is sure to let oil drop down on the drawing if it should happen to be left directly underneath, spread upon a truck or table.

This is where the advantage in the use of rods comes in. A good rod, upon completion, is shellaced over and thus is immune to attacks from oil and moisture, besides being easily handled, and having all the information thereon required. Of course a proper working drawing must be made in the first place in order to make the various patterns required. If the factory is staffed with good mechanics, a lot of the usual detail may be omitted, but where a comparatively green staff is employed, everything must be clearly set forth on both drawing and rod; otherwise foreman and superintendent would have a merry time of it.

How to Proceed With Work

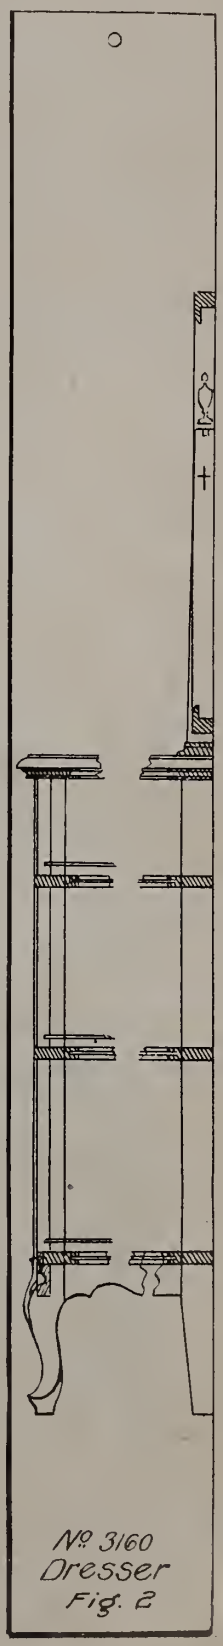
Rods may be made in various sizes, according to the nature of the work for which they are intended. A convenient size for medium and high grade case goods being 84" x 10" x 3-8", while shorter ones answer nicely for chair purposes. Phonograph cases can be shown to advantage on a rod measuring a couple of inches wider than the case itself, to allow a suitable margin and some six to eight inches longer than the total height of the case to allow for the inscription and other written particulars either at top or bottom, as preferred.

In every instance, clear white bass-wood should be used. placed and sanded both sides to 3-8", jointed on one edge, and then ripped with fine saw to insure both edges being parallel. Give one coat of white shellac or good substitute and lightly sand with fine sand paper. This shellac forms a good working surface and keeps the rod from becoming dirty and smudgy. A small twelve-inch steel blade T square, and a pocket knife with the blade dubbed off at an angle and sharpened, and a specially constructed gauge forms the principal weapons of attack. Several bottles of colored waterproof ink (Higgins), and a fine pointed pen, to show end-wood or other particular points, sets the rod off, and enables it to be more readily understood.

Start With Centre Line

It is the best policy to leave the rod until either a sample case or the whole batch is run for the first time. Then any change in construction or minor detail, that may be deemed advisable, can be made on the rod and on the new stock bill—for it is also a good plan to use only a paper stock bill for the first run, then when the rod is made the stock bill with any changes, may be re-written on the permanent cardboard one, which should be sprayed with shellac to keep it clean and legible. Spraying is better than coating as the former method does not tend to pull the ink. A check-off column should be left white so as the swing sawyer or rip sawyer can check off with pencil each item as fast as he gets out the required qualities

In showing the longitudinal plan, the best method, at least to the writer's notion, is to start with centre line (See sketch), and in the case of a dresser for instance, to follow by laying out the length of the top, then the posts are set to the proper distance in from the edges of the top, or altered slightly to allow a convenient measurement for length of front rails, drawer fronts, etc. In working from this centre



line everything balances up nicely, errors are quickly located and measuring is fascilitated. The "end plan" can generally be shown on the same side of the rod (See Fig. 1). This is so arranged to show length of gable rails, bearers, guides, drawer sides, etc., and width of gable panels, drawer divisions, and all other dimensions necessary to complete the purpose of the longitudinal plan.

Number Items to Correspond to Stock Bill

On the other side of the rod (See Fig. 2) the cross section is laid out, showing height of case, length of posts and gable panels, width of front and back rails, shapes of mouldings on tops and under frames, shapes of feet and detail of carving, if any. Each item on the rod is numbered to correspond with the number on stock bill, which was numbered originally when paper drawing was made. When every number on "stock bill" has been accounted for on the rod, and any special instructions as to boring or shaping have been written or printed on, the rod is shellaced again which preserves the work and keeps it legible. A hole is bored in one end, and after use it may be hung up in a convenient place until another lot is "broken out."

Before starting to "ink in" anything on the rod over the shellaced surface some French powder should be sprinkled on and rubbed off lightly with a cloth. This prevents the ink from creeping or rolling up. All straight lines should be scratched in either across the grain with a knife and T square, or with the grain, using the gauge. To darken these lines where necessary, a lead pencil sharpened flat like a chisel and drawn along these furrows or scratches, leaves them as dark as an ordinary pencil line.

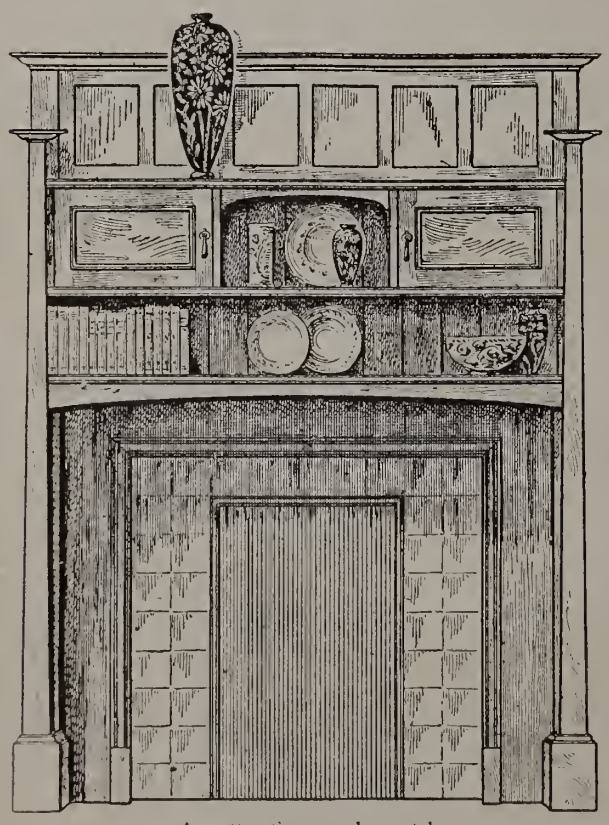
This may seem to be a very lengthy process, and a lot of bother, but from actual experience, in several factories, it is time well spent.

Mantel Important Fitment in Home

Design and Details of Mantlepiece—Dimensions May be Altered to Suit Requirements of Any Room—Deserves Careful Treatment

By R. M. Dearth

The decorative value and the importance of the mantelpiece is becoming more and more recognized. This piece of home furnishing often makes or mars a room. The accompanying illustrations show a design for a plain but attractive mantel that should fit in well with the decorative scheme of the modern



An attractive wood mantel

home. Should a plate rail be used it would be well to keep the top of the mantel in line with the rail. This can be used with either coal or gas grate or electric heater

The size given is only suggestive as individual requirements differ. The dimensions may be modified to suit the requirements of any room. The design can in fact be adapted to almost any existing fireplace and if the size has to be altered all that is necessary is to draw a new scale and work to it.

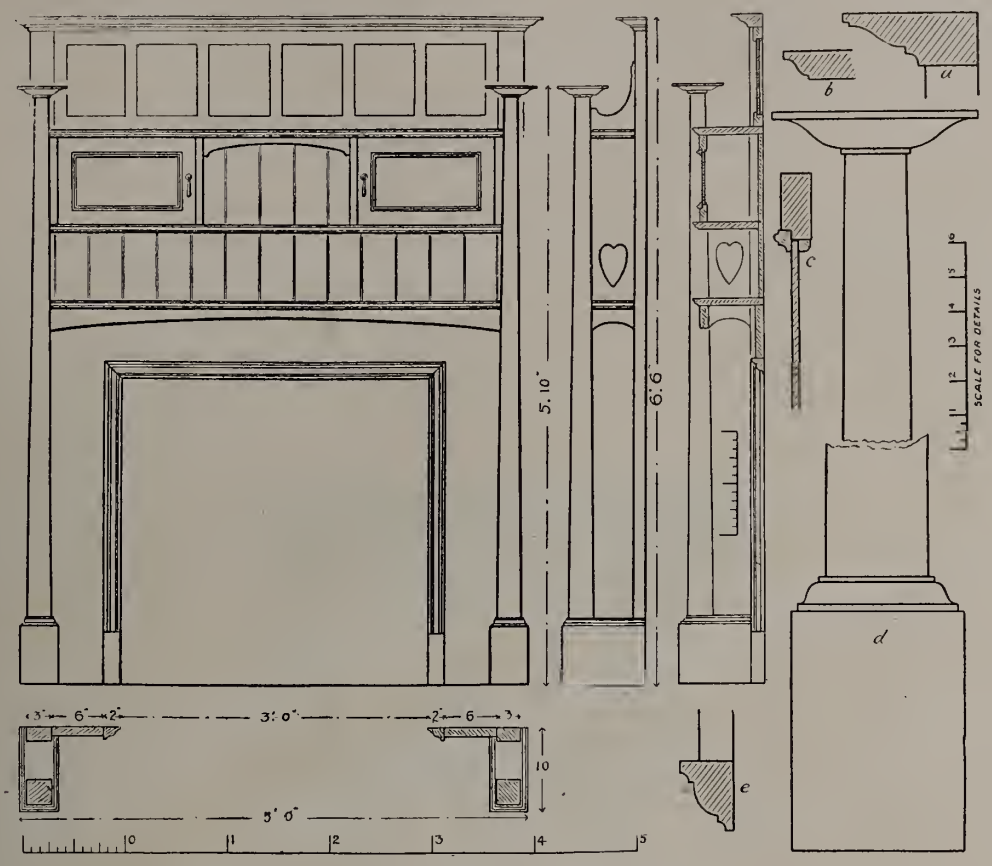
In the illustration shown the total width over the plinths is 5 ft., and the extreme height at the back 6 ft. 6 inches. Between the plinths the width is 4 ft. 2 inches. The height to the first shelf is about 3 ft. 9 inches so that ample provision is made for dealing with any existing fireplace. The height of the middle (or cupboard) shelf is about 4 ft. 6 inches, whilst the top shelf is about 5 ft. 5 inches from the floor, about eye level. The cupboards are 16 inches by 10 inches, with an inside depth of 10 inches. Deeper cupboards may be provided for by moving the columns an inch or so forward.

Oak is a very good wood to use for a fitment of this type, though chestnut, ash or birch could be used to advantage. Much may be done in the way of facing up. If the columns, plinth, doors, shaped front rail and shelf moulds are in solid hardwood, it is possible to use cheaper material for the less prominent parts. Camouflage should not be attempted if a real good article is desired.

Practically all the information required is included in the scale drawings shown. The cutting list is added for reference. The columns taper from 3 inches at the base to 1¾ inches at the top, being finished with a moulded cap, 6 inches square. The plinths should be solid but it may be found advantageous to build them up from ⅞-inch stock and with applied mould.

The shelves may be solid with moulded edge, notched to the columns, or as already suggested may be of some cheaper wood faced up with a mould. The doors are framed from 2 inch by ⅞ inch material, with neat moulding, and are hinged to narrow posts housed to the columns. This is clearly shown in the illustrations.

The treatment of the fireplace depends largely on the general scheme of the room. In the drawing a



Details of construction giving sizes

tile opening 3 ft. 3 inches is shown, with a moulded architrave and wood surround. This is a good arrangement for the average fireplace.

Cutting List

	Long ft.	Long ins.	Wide ins.	Thick ins.
2 plinths		10	8	5
2 front columns	5	2	3	3
2 column caps		6	6	1¼
2 back pilasters	5	9	3	1½
2 fireplace stiles	3	8	6	1
1 fireplace rail	3	6	6	1
Architrave mould	9	0	2	1½
2 blocks for ditto		6	2	1½
3 shelves	4	9	8½	¾
1 front shaped rail	4	6	2½	¾
1 end shaped rail		6	2½	¾
2 ends	1	8	5½	¾
2 end brackets		8	5½	¾
2 cupboard divisions		10½	7	¾
2 door posts		10½	1	⅞
4 door stiles		10	2	⅞
4 door rails	1	4	2	⅞
2 door panels	1	1	7	¼
Door mould	7	0	⅝	½
1 short shaped rail	1	7	2	½
1 back capping mould	5	4	4	1½
Material for back	24	0	4	½
Top back framing	15	0	1¾	¾
6 top back panels		9	8	¼

The ends are treated as shown in end view. The ends proper are shown with a heart-shaped opening at the side of the open shelf. Small brackets are used above the top shef while a small shaped rail is fitted below the lower open shelf. The back pilasters (13 inches wide) rise from the plinths. The top back is finished with a mould, which may be grooved to hold plates. The upper back is shown neatly panelled without mould. The lower back behind, the cupboard and open shelf, may aso be framed up if desired, but is shown plain here.

The list is for mantel as shown. Lengths quoted allow for joints but thicknesses are net.—The Woodworker, London, Eng.

Southern Pine and Douglas Fir Compared

There is little difference between the strength of the southern pines and that of Douglas fir from the Pacific Northwest, tests made at the United States Forest Products Laboratory show. True longleaf yellow pine averages heavier, stronger, and tougher than Douglas fir. True shortleaf pine averages heavier and tougher than the fir, but is about equal to it i strength as a beam or post. Loblolly pine, though averaging heavier than the fir, is somewhat weaker. The difference in strength between any of these pines and Douglas fir, however, is not so great but that low density pieces of the one species are weaker than the average for the other species.

As far as strength properties are concerned, the choice between any two lots of southern pine and Douglas fir will depend upon the grade and density of the timber composing each lot. The Rocky Mountain type of Douglas fir averages considerably weaker than the Pacific Coast type.

Attractive Furniture From B.C. Maple

Vancouver Company Breaks Into New Field—Exploits Native Hardwood Heretofore Not Used in Commercial Manufacturing—Importing Oak Logs from Siberia

By Our Vancouver Correspondent

Seeing is believing, therefore the correspondent of the Canadian Woodworker and Furniture Manufacturers' is in a position to acknowledge unreserved belief in the radical advancement in furniture manufacture achieved this year by the Restmore Manufacturing Company, Ltd., of Vancouver. This progressive concern is now making all forms of high class furniture in their Vancouver factory. But the greatest step in the new departure is that they are making it of hardwood and of hardwood from timber found in the wooded hills of B.C.

Extension table in B. C. maple, from the line of the Restmore Mfg. Co., Limited, Vancouver, B. C.

Every one at all posted in the industry in this province has been familiar with the many efforts that have been made in the past to utilize Douglas fir for making furniture. That splendid timber is still used and long will be, for some articles of furniture. But it has often been the expressed regret that there was no hardwood in this province of timber, from which suitable furniture material could be obtained. Mr. Barber, the founder of the Restmore Company, and the man who put the "rest" in the Restmore mattress, though he never rests himself, must get the credit for finding hardwood timber in British Columbia, suitable for the highest class of furniture work, finding it in sufficient quantities to warrant the expansion of their factory to establish a permanent manufacture of the sort, and also for getting the timber right from the woods to the factory.

Hardwood From B. C. Logs.

What is mighty interesting also, is to visit the big plant in the east end of Vancouver and see the rough logs unloaded from Canadian National Railway cars on the factory siding, then to see the logs cut into boards of varying thickness suitable for the different parts of the furniture into which it is to be made. That little saw-mill, tucked away in the corner of the big yard at the back of the Restmore plant, is a novelty in that it was delivered, assembled and put in running order and started cutting lumber in eight days after it was bought. Some time last spring the company found that they could secure sufficient hardwood logs to meet all the requirements of a large factory for years to come. They had been looking into the matter for years, and Mr. Barber had spent much time in the woods looking for the timber. The result was that a small logging camp was put in on Mount Cheam, in the Fraser Valley, about 90 miles from Vancouver, and soon logs were being sent in by rail to the factory. It was decided that the best policy was to cut the logs into lumber on their own premises and the small portable mills now in use was put in. It is doing the work efficiently and is also very useful for cutting up spruce and fir for secondary material and cedar and alder for crating and other purposes. That little mill is the only one in British Columbia put in to cut hard wood from B. C. timber. It has been operating for several months now, and the company expects to keep it going steadily, as they can get the timber, though it is somewhat scattered.

This is the first time that a serious and successful effort has been made to turn the broad-leaf maple of the coast districts to commercial account. It is the only one of several varieties of the "Acer" family, found in this province, which is large enough for any such purpose. The logs being brought in by the Restmore Company are from sixteen to twenty feet long and the largest is possibly not more than 24 inches in diameter. These logs are also as a rule somewhat rough, and not easy to handle. But, as Mr. Barber says, the rougher they are the better effects in grain they can get, which is an advantage in making furniture. Since beginning work the company has gone ahead steadily with perfecting all the steps in the familiar process of taking rough timber and turning it into finished pieces of furniture fit to grace the drawing rooms, dining rooms and sleeping chambers of the finest homes in the land. Every step is carried right through from the log to the shipping room. Three dry-kilns, built of hollow tile brick, are used to season the timber, and ample storage space is provided, all under cover, to take care of a large stock of the wood ready for making up. When the reconstruction plans of the company, now being carried out, are complete, there will be a battery of five dry-kilns to take care of the green timber as it comes from the saw.

Furniture in Oak and Maple.

In the factory there are machines installed with ample capacity for turning the rough lumber into finished shape, and cutting the various standard parts for every article of furniture. These are cut and stacked up by the thousand, ready for the next process in the assembling rooms, where a band of skilled cabinet-makers are always at work. From there the articles in the rough are passed on to finishing rooms, where the surface is smoothed and made ready for the

final stages of the art of furniture making, that of receiving the coats of stain and varnish and the careful polishing and buffing which turns them out a delight to look on and a credit to the makers.

With very trifling exception the company is now devoting its furniture factory to high-class hardwood furniture, and giving up almost entirely making any articles from Douglas fir. For some time the company has been making a line of oak furniture, and to a limited extent this is still being done. Very shortly, however, the intention is to branch out into oak on a larger scale. This will meet the demand that always exists for furniture of that wood. But to secure the raw material the Restmore Company is going far afield. They have about concluded their arrangements to import Siberian oak in the log, to be cut into suitable dimensions and specifications in their own mill. With the many lines of freight steamers, particularly the Canadian Government Merchant Marine, operating direct to the Orient from B. C. ports, it is a simple matter to bring in this timber, and the expectation is that with lowered ocean freight rates and the heavy increase in rail rates, a great economy can be effected. With the supply of local maple referred to above, and with the oak from Siberia the Restmore Company is making all its plans to specialize in hard wood.

While a very large line of its bedroom suites is still being made in the popular ivory enamel finish, stained and polished suites in a variety of effects are also being made. In dining room furniture a splendid choice of styles and finishes is being made, while in fine drawing room pieces the company is continuing its heavy upholstered manufacture, the facilities of its big mattress plant being invaluable for turning out the high class stock they make. In occasional pieces, such as small parlor tables, writing desks, hall chairs, etc., the maple wood is being used in a variety of finishes. Having made the big advance into the field of hardwood furniture, the aim now is to make a complete line of house furnishing which will carry the well-known name of Restmore, long a household word in the west for mattresses, springs and iron and steel beds.

Ambitious Plans of Successful Concern.

With a site 210 feet frontage by almost 800 feet in depth, and railway sidings and trackage privileges adjoining the Great Northern terminals, the Restmore Manufacturing Company is in splendid position for the expansion it now has in hand. When present plans are completed the front of the big plant will have a fine brick warehouse and shipping department extending across the full 210 foot front, and 75 feet in depth. This will be three stories in height, and will also contain the business offices. The present factory will then have much larger floor space, and will be re-arranged so that light railway tracks will extend right through from the sawmill at the rear, to the dry-kilns and through them to the storage and factory space, providing the utmost facilities for handling the raw material. The factory space will be further increased by removing the excelsior mill from its present location to a new building to be erected at the other side of the company's trackage. To take care of the fuel made from the saw and planing machines a storage house of large capacity and fire-proof construction is to be erected over the boiler house, so that all waste will be used for fuel.

Some idea of the capacity of the woodworking plant for turning out high-class furniture may be gained from a partial list of the machines and equipment installed, and which are being added to from time to time. In the finishing department there are two automatic sprayers of the Aero system, manufactured by the De Vilbiss Manufacturing Co., Toledo, Ohio. Two of the Rockford Tool Company's rubbers are also included in the department. In the woodworking department are a 4-sided moulder by Cowan & Co., a rip-saw with adjustable table, a self-feed rip saw, and a pony planer, all by the same company. A jointer made by the Canada Machinery Corporation, also an 8-inch 4-head sticker, a radial boring machine, a 12-spindle dovetail machine and four sanders, one of them a double end drum type, by the same concern are other machines in use. Some of the MacGregor, Gourlay Co., Ltd., machines used by the Restmore Company, are a tenon machine, a large surfacer, a 10-inch back knife lather, a 12-inch jointer and a dado saw. A sander by the P. B. Yates Company and one by the Hespeler Machinery Co., are in addition to those supplied by the Canada Machinery Corporation. Other important machines in use are a glue-jointer made by the P. B. Yates Machinery Company, an 8-inch Clement jointer by the American Woodworking Machinery Co., a No. 1 Variety saw bench by the latter company, a 6-spindle mortiser made by Wysong & Miles Co., Greensboro, Mass., a dowel machine by W. S. Hawker & Co., Dayton, Ohio, a double cut-off saw by the Beach Manufacturing Co., of Montrose, Pa., and a veneer trimmer by Brown, Boggs Co., Ltd., Hamilton. Very extensive increases in plant and equipment are contemplated in the plans now under way for completing the Restmore plant.

Starting in 1905 as a mattress making plant, the company was then known as the Barber Mattress Manufacturing Company. Putting the trade-mark "Restmore" to the front with such success, the company adopted the name later on. It has for years been making bed springs and iron and steel beds for a large trade, and its plant in those two departments is as extensive and complete as that just referred to in its furniture factory. In all some 160 employees are steadily at work, and a staff of salesmen are constantly covering Western Canada putting Restmore products in every town and city and camp over an ever-extending territory. The founder of the company, Mr. F. K. Barber, is the president and general manager; Mr. J. E. W. Thompson is vice-president and sales manager; Mr. R. Hunter is secretary-treasurer.

To Estimate Flooring

To determine the amount of flooring required for a certain space, figure the number of square feet in that space.—that is, multiply the length by the breadth of the room. Add to the square feet of surface to be covered the following percentages, which will give you the number of board feet of flooring required:

50% for	....	13/16 inch x 1½ inch
37½% for	....	13/16 inch x 2 inches
33 ⅓% for	....	13/16 inch x 2¼ inches
50% for	....	⅝ inch x 1½ inches
33⅓% for	....	⅝ inch x 2¼ inches
33⅓% for	....	⅜ inch x 1½ inches
25% for	....	⅜ inch x 2 inches
25% for	....	5/16 inch x 2 inches

If the room to be floored has bay windows, alcove, or other "offsets," allowance must be made, of course, for the additional floor area.

Can You Dry Red Gum Successfully?

Requires Special Treatment—When Properly Treated is Very Satisfactory Wood—Special Attention to Piling and Manipulation of Kilns

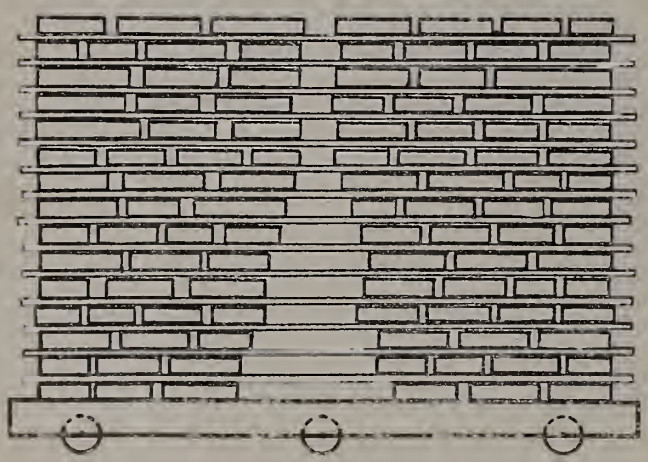
By H. A. Rolphe

Red gum is considered by many wood-users to be a very refractory wood, one that tends to give a considerable amount of trouble, both during seasoning, through subsequent manfacturing operations and even in the finished product. This reputation is not deserved, for with proper seasoning and intelligent care in kiln-drying, satisfactory results can and are being secured. With warping and checking reduced to a minimum, if not eliminated, the inherent good qualities of this lumber are such as to commend red rum to all woodworkers.

Satisfactory results can be readily secured by proper care and treatment in the dry kiln. Gum has little peculiarities of its own which must be studied, understood and treated accordingly. Once properly dried, and kept dry, the tendency to warp, twist and check disappears. It is then that the real advantages of this wood make themselves known.

Piling Requires Extreme Care

Perhaps the most important factor in the seasoning and kiln-drying of gum is the piling. This lumber



Piling with "Chimney" to increase circulation through pile.

must be piled carefully so that it will not only remain straight while on the stocks and in the kiln, but so that it will be held straight and all tendency to warp and twist resisted. To this end the stickers should be carefully placed one above the other, so that each sticker has an even, solid bearing on the one beneath it. It is also advisable to use more stickers than would be the case were other lumber being dried; say a cross stick every two feet with one as near each end as the kiln trucks will permit. It is also advisable to separate the lengths and pile each length by itself. This avoids all overhanging ends—a sure cause of warped boards—and in addition is advantageous because it enables a greater number of loaded trucks to be placed in a kiln. The better way is to have the lumber sorted into lengths as it is unloaded from the railway car.

One large manufacturer after experimenting with piling the lumber on the trucks with a "chimney" in the center, has adapted this method as a regular practice. He found that the lumber dried more evenly and quickly and that the savings thus effected more than offset the additional time required to stack the lumber. Piling in this manner improves the circulation in center of the pile.

Steaming to Relieve Stresses

After piling, the steaming next commands attention. Each dry kiln operator seems to have his own ideas about steaming. Some will steam 4/4 gum for forty-eight hours at a temperature of 110 and humidity at dew point, while other operators will carry 130 degrees of heat for a shorter period. Sometimes a temperature as high as 200 degrees or even 210 degrees is used. Even with 100 per cent. humidity this practice seems to be nearing the danger mark. Exceptionally good results have been secured by steaming from 12 to 18 hours at 150 degrees. Some carry 150 degrees for six hours. When carrying high temperatures, the humidity in the kiln must be watched carefully for should it be allowed to drop, the high heat will probably injure the stock.

After the initial steaming period the humidity, and, if necessary, the temperature should be gradually lowered, in accordance with the drying schedule to be followed. All changes in temperature or humidity should be made slowly and gradually. A drop or rise in temperature of 10 degrees or a drop of 5 points in humidity require at least five hours to make the change. A quick increase in temperature or a sudden drop in humidity is bound to have an injurious effect on the stock being treated.

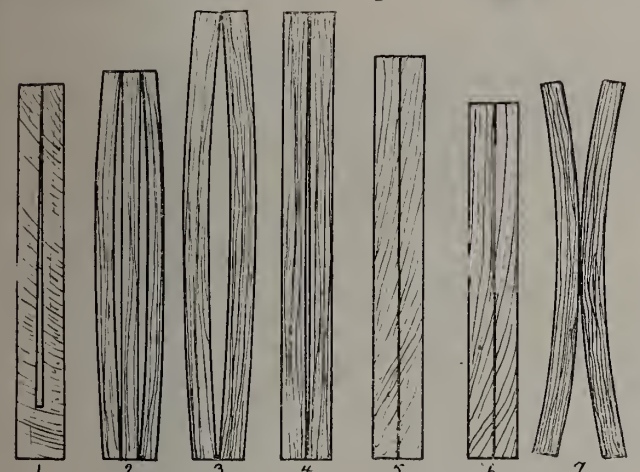
It is hard to lay down a hard and fast drying schedule. The kiln, the operator and the grade and condition of the lumber are all governing factors. One point to observe is that the higher the temperature carried, the higher should be the humidity. As the temperature and humidity that a given lot of lumber will stand without injury depends largely on its moisture content and to a lesser degree on whether or not it is casehardened, the condition of the lumber should be known, not only when the load is placed in the kiln but all through the drying operation. With this knowledge the operator, if he knows his business, is in a position to push the drying operation as fast as possible without risking the lumber. He also knows the exact moment the desired moisture content is reached and thus the drying is not prolonged any longer than necessary.

Tentative Drying Formula

During the run a very close watch must be kept to guard against checking and casehardening. At the first indication of checks the humidity should be raised. It is better, however, to guard against checking rather than strive to prevent its development after a tendency to check is observed. If frequent tests are made moisture content and the surface and core of the sample tested separately, the difference between the moisture content in the center and that

of the surface wood will give a good indication of the way the stock is drying and the likelihood of checks occurring. A few experiments, together with a little observation will soon demonstrate the variation that is permissable. The same applies to casehardening, as too great a difference would indicate that casehardening is occurring. Then there is the resawing test for detecting casehardening. In this, the shape assumed by the prongs of the sample resawed, give an indication of the amount of stress between center and surface.

The following schedule has been worked out by the Forest Products Laboratory at Madison, Wis., for the drying of air-seasoned red gum. Lumber having



No. 1 was not steamed at all. Notice the pinching together in the saw kerf.

Nos. 2 and 3 were not steamed sufficiently long to remove the casehardening. 18 minutes final steaming.

Nos. 4 and 5 and 6 were so steamed that stresses were removed. Such lumber does not warp. 36 minutes final steaming.

No. 7 was over-steamed showing a reversal of stresses. Steamed for 3 hours.

a moisture content of 19 per cent. or less is classed as air-dried, while above 18 per cent. it is considered green, and the formula changed accordingly.

As all the changes in both temperature and relative humidity should be governed entirely by the condition of the stock, the time periods given are only tentative and should not be followed rigidly.

Tentative drying schedule for air seasoned red gum:

	Temp.	Per cent. Humidity
After steaming	135°	85
" 12 hours' drying	140°	75
" 24 " "	145°	60
" 36 " "	150°	50
" 48 " "	155°	45
" 60 " "	160°	40
" 72 " "	160°	40
" 84 " "	160°	35
" 96 " "	160°	30
" 108 " "	160°	30
" 120 " "	165°	25
Until dry	165°	25

For ten hours after moisture content has reached 5%—165° with 80% humidity.

Overcoming Casehardening and Checking

If the stock checks or casehardens during the run, the humidity should be raised slightly, or if the signs indicate severe injury resort might be made to steaming. Some manufacturers make a practice of steaming at the end of the run and thus relieve all stresses and strains that may have been set up during the drying operation. This steaming is usually done just before the final percentage of moisture content has been reached. Final steaming should not be carried on at a temperature more than 10 degrees higher than the final drying temperature. The length of such steaming period is important. If carried on too long, what is known as "reverse casehardening" is often set up. It is better to steam for several short periods than to overdo it. The accompanying sketch shows the result secured by steaming for various periods. Some make a practice of simply increasing the humidity for the last few hours as indicated in accompanying formula.

The red gum department of the American Hardwood Manufacturers advocate, in their book on red gum, that the gum lumber be taken from the kiln trucks while hot and piled in a solid pile and allowed to remain this way for about 10 days. Whether this is advisable or not the writer is not prepared to say, but it seems to be at variance with the usual kiln drying practice.

National Council Hold Annual Meeting

The second annual meeting of the National Council of Furniture Associations was held at the Washington Hotel, Washington, D.C., on December 8 and 9.

The meeting was notable for its serious deliberation and complete harmony. The great question for consideration was, of course, the present slump in business and ways and means to start the wheels to turning.

Stable and permanent selling values seemed to be the most needed thing to encourage sales both on the part of the manufacturer and the retailer. The impossibility of further reductions under present conditions of labor and materials was apparent to all. In fact, there seemed to be a feeling on the part of some that there might be at least a temporary advance in some raw materials such as hardwood lumber, owing to small stocks in the hands of lumbermen and the possibility of a sudden demand.

With labor and materials at the bottom point for some time to come, there seemed to be no reason for uncertain costs except as to fluctuation of overhead on small or large output. It seemed possible, therefore, for furniture manufacturers to issue new price lists, based on replacement costs, which would have a great degree of permanance through the furniture markets in January and the spring season. With the strong manufacturers taking this attitude and action, the vascillating and weak-kneed brother would be encouraged to save his own neck by not resorting to ruinous prices to force business.

In accordance with this feeling, the unanimous views of the council were expressed in the following recommendation to member associations:

1. That manufacturers of furniture establish at once values based upon replacement costs, including a fair consideration for labor.

2. That such values be established as permanent values for the spring season of 1921.

3. That if any guarantee be deemed advisable that said guarantee be to the effect that any change in price during the spring season of 1921 be retroactive 60 days prior to the date of such change.

These recommendations having been concurred in by representatives of the Retail Furniture Association of the United States, it is the opinion of the National Council that general adherence to same will have a strong tendency to stabilize the January markets and promote sales.

The council went on record as favoring the open shop which is in line with the general movement in manufacturing fields in this country.

Defects Ordinarily Found in Lumber

The large number of defects found in lumber and the many grades which now are on the market make lumber grading exceedingly complicated. Only a person thoroughly familiar with wood and with long experience in handling lumber can expect to pass on the grade of any particular lot satisfactorily. The layman, however, can readily comprehend the theory of grading if he is willing to study the subject.

The accompanying photograph of a panel prepared at the Forest Products Laboratory shows some of the more common defects recognized as such commercially. The kind, size, number, and location of defects, as well as the size of the board, determine the grade of lumber.

Knots are classified not only as to their size, but also as to their condition, such as sound, rotten, tight, and encased. Lumbermen's associations differ in their definition of an encased knot, but they agree in general that it is one not completely intergrown with the surrounding wood.

The seriousness of shakes and checks depends upon their length and whether they go clear through the lumber.

Pitch pockets, which are an accumulation of resin in lens shaped openings, are classified with respect to their length and width. On the other hand, pitch streaks, which are an accumulation of pitch within the fibers, are classified with respect to their length and width as compared with the length and width of the board they are in.

Clear sapwood is not considered a defect in many of the higher grades, and stained sap is not classed as a defect in the lower grades.

The holes made by sap suckers and wood-peckers often depreciate the quality of wood. The discoloration produced above and below the peck is usually more of a defect than the hole itself.

Decay is a serious defect and is not permitted in any but the lower grades of lumber.

Wane, which is the presence of bark or the absence of a square edge for any reason, will lower the grade of clear lumber, but it can be trimmed off without much loss. In the New England states much lumber is not edged at the sawmills, and the edges are trimmed square with the faces of the boards when the lumber is worked up.

Because of the presence of defects in logs a great deal of low grade lumber is produced and as our virgin forests become more and more depleted, closer utilization of top, second growth, and defective trees will increase the proportion of low grades. These must necessarily sell at a comparatively low price, and for many purposes are entirely satisfactory. In many instances the more serious defects can be cut out, and the lumber used for high grade work.

Walnut Manufacturers for Open Shop

At the November meeting of the American Walnut Manufacturers' Association in Chicago, the members present unanimously adopted the following resolution:—

"Resolved, by the members of the American Walnut Manufacturers' Association, here assembled, that it is the sense of this meeting that the principle of the open shop be commended and approved; and that the moral suport of this association in all its relations should be freely given to any and all members of the association or to any committee which are seeking to put into actual effect the practice and principle of the open shop."

Since its adoption the resolution has been submitted to members who were not present at the meeting, with the result that its adoption has been approved by every member of the association.

Pioneer Furniture Manufacturer Passes

In the death of J. W. Kilgour, which occurred recently at his home in Beauharnois, P.Q., the firm of J. W. Kilgour & Bros., Limited, Beauharnois, loses its esteemed president and the furniture industry one of its oldest active members, for he has been actively

The late J. W Kilgour.

connected with the manufacture of furniture since 1863—a matter of 58 years. Mr. Kilgour was born in Beauharnois in 1843 and at the age of 15 entered his father's cabinet shop, where he served his apprenticeship. In 1863 he opened up a small shop of his own, taking his brother into partnership a few years later. A steam plant was installed about 1870. The present organization, J. W. Kilgour & Bros., Limited, was incorporated in 1910, with Mr. Kilgour as president. Thus he lived to see his business grow from a very small beginning to what is one of the largest furniture manufacturing industries in the province of Quebec.

The heartfelt sympathy of his many friends in the industry will go out to his bereaved relatives and business associates.

Lumber for Sewing Machines

About 60 million feet of lumber are used annually in the manufacture of sewing machines. Oak and red gum each supply nearly one-third of this lumber, and yellow poplar and black walnut each a little more than one-eighth, the balance being made up of tupelo, chestnut, cottonwood, maple, basswood, birch, sycamore, mahogany, yellow pine and redwood. Tops of sewing machines are usually made of hardwood veneers such as oak or walnut, or of other woods stained to imitate mahogany.

Woodworkers who Won Honors in Civic Arena

K. J. Shirton, Wm. Shirton & Co., Limited, Dunnville, Ont.

Jas. E. Gardiner, P. W. Gardiner & Son, Galt, Ont.

J. A. Laberge, Laberge Lumber Co., Limited, Sudbury, Ont.

Dunnville Honors Woodworker

K. J. Shirton, of the Wm. Shirton Co., Limited, who operates a large planing mill and woodworking plant at Dunnville, Ont., was recently elected mayor of Dunnville for 1921. Mr. Shirton is one of the live, aggressive business men of that town and has given considerable attention to public affairs. In recent years he has served in the following capacities: As member of the Board of Education, as councillor, on the Public Utilities Commission, and as president of the Board of Trade.

Woodworker Wins Civic Honors

James E. Gardiner, junior member of the firm of P. W. Gardiner & Son, Galt, general woodworkers, sash, doors, etc., was elected an alderman of that city at the recent municipal contest. Alderman Gardiner had the honor of heading the polls with a substantial majority over his next competitor. This is his first experience in public life. Mr. Gardiner is well-known in the woodworking field having travelled for years throughout Ontario and the Maritime Provinces in the interests of the firm.

Wins Honors in Civic Arena

J. A. Laberge, Laberge Lumber Co., Limited, Sudbury, Ont., who conducts a large woodworking operation in connection with their lumber business, was recently returned by acclamation, as mayor of that city. This will be his second term in office and is a mark of appreciation for the valuable service rendered during 1920. Mr. Laberge is only 28 years of age and has the distinction of being the youngest man who ever held the position of chief magistrate of Sudbury.

Optimism Keynote of Convention

Optimism was the keynote at the convention of the Canadian sales force of the Internationtl Business Machines Company, held at the offices of the Company, Royce and Campbell Avenues, Toronto in the week of January 3rd, 1921. About 75 salesmen were in attendance, the three well-known divisions of the Company—International Time Recorders, Internation Dayton Scales and International Tabulating and Sorting Machines.

Assembling just after the close of a record business year, the members of the sales force voiced a justifiable pride in the achievement of 1920. That even this excellent showing, would be eclipsed during the present year was the confident prediction of the salesmen present, based on observation of the prospects in their respective fields.

"A fifty per cent increase in business in 1921" is the task to which they have addressed themselves and not a few expressed the conviction that even this mark would be passed long before the close of the year.

Figures presented at the convention showed that the sales forces of the American firms manufacturing similar products. In fact, the Canadian organization has led the entire world in sales, on percentage of quota, for four successive years. The Canadian boys, naturally felt elated, and justifiably so, in view of the fact that the sales forces in the United States and England number some 1100 men, and that all quotas are based on the same figures, namely, of publication.

F. E. Mutton, Vice-President and General Manager, of the International Business Machines Co., Limited, is proud of his sales forces and advises that not only he, but the entire sales organization never were more optimistic as to the future.

If a heavy machine fails to maintain production due to slippage of a single-ply belt, replacing the belt with a double-ply one often overcomes the trouble.

A saw driven by a belt, which is too light or too narrow, cannot be expected to give satisfaction. The saw itself is not to blame.

Acquire Cooperage Plant in Stratford

As announced in the December "Canadian Woodworker," the Manufacturers' Lumber Co., Limited, Stratford, Ont., have acquired the cooperage plant in Stratford, formerly operated by Merritt & Co., of Chatham, Ont. Hoops, staves and hardwood lumber will go to make up the output of this plant. In addition to the cooperage plant, a sawmill, with a capacity of 1,500 feet per day, is operated at Shakespeare, Ont.

J. A. McFadgen, the founder of the company, taught school for several years previous to embarking in the lumber line. It was while principal of a public school in Stratford that he came in contact with the late Mr. George McLagan, who was then a member of the Board of Education. A close friendship was formed between Mr. McFadgen and Mr. McLagan. In 1903 when this progressive furniture company, which used principally domestic woods, ran short of stock, buyers were sent out in all directions, in order that as large a supply as possible might be secured. Mr. McFadgen undertook to do some exploring for the company. Born and brought up in Wellington County, he had a fairly good idea of trees, their properties, uses, growth, etc. He then learned the grading of lumber by spending every spare hour of his time down at the McLagan factory watching the break-out saw.

Two years after Mr. McFadgen started the Manufacturers' Lumber Co., he was joined by his brother, the late W. A. McFadgen, and in 1907 another brother, G. A., came into the company, and was followed three years later by C. A. The latter two now do the buying grading and shipping, while J. A. gives his personal attention to the executive and selling ends, and also supervises a portion of the buying.

When asked how the name "Manufacturers' Lumber Co." happened to be selected, Mr. McFadgen said it was because their special business was to buy from the manufacturer and sell direct to the factories. There was thus only the one profit and the one handling. By reason of this, better service could be given and a more thorough and intimate connection developed. A nice business has been worked up with furniture and implement factories and manufacturers of hardwood trim.

Breaking-in New Saw Blade

New saws should be carefully and slowly put to work, gradually increasing the time allowed to run on the mill until the saw gets into a set condition.

First place the saw on the wheels with the teeth well clear of the edge of the wheel; strain or tighten the saw over the wheels, noting that the amount of weight or strain is correct for the width and gauge of the saw. Tilt the loose or driven wheel by means of the handwheel, if necessary, to place and keep the saw in a position on the wheels—that is to say, about 1 in. to 1½ in. overhung from the edge of the wheels carrying the saw. Then run the mill for at least 15 minutes without cutting.

Now take the saw off and place it on the levelling plate, test it with the level for lumps and twist. Correct in each case any part of the saw that requires it, unless a loose place be found.

Do not attempt to adjust the latter, if it exists, as it will pull tight after the saw has been run on the mill a few times. Once again place the saw on the wheels, and run as before; again take it off, place it on the bench and look it over, correcting where found necessary. The next time the saw goes on run it at a slow feed rate for 15 to 20 minutes, when again it should be carefully examined, finally sharpened, swaged and shaped.

As the tendency of a new saw is to run fast or tight under the tooth, test carefully and thoroughly for this fault. If the tension gauge is used on half the width of the saw, i.e., from the center to the front, it will readily show if this condition of being fast under the tooth exists.

Heavy Ends, Light Sides, Make Strong Boxes

Balanced Construction of Wooden Boxes—Comparative Strength of Boxes of Heavy and Light Material—Holding Power of Nail Governing Factor—Value of Strapping

By T. C. Sims*

A little observation of box failures is sufficient for anyone to determine that failures are usually due to the box opening up at the corners. Seldom are the boards themselves broken. If the nails hold, or, in other words, if the joints at the corners hold together, the box is most likely to stand up and deliver the goods. Very thin lumber will often carry the most surprising weights if the box in which it is used is so constructed that the joints hold together.

The chart reproduced on the opposite page represents a series of tests made at the U.S. Forests Products Laboratory, at Madison, Wisconsin, on a box of standard dimensions for carrying boots and shoes: viz., 35¾ x 17⅛ x 13¾. The figures at the top of the different columns represent the number of falls, which the box being tested, received in the testing drum. This drum is 14 feet in diameter, with special hazards arranged on every one of the six sides. As the drum revolves, the box is carried up and falls on the special brass or metal points which form the hazards on the inside of the drum. In a great number of revolutions the box must fall in almost every conceivable position, cornerwise, sidewise, endwise, etc. The heavy horizontal lines in the chart indicate the number of falls reached by the various boxes and specifications tested.

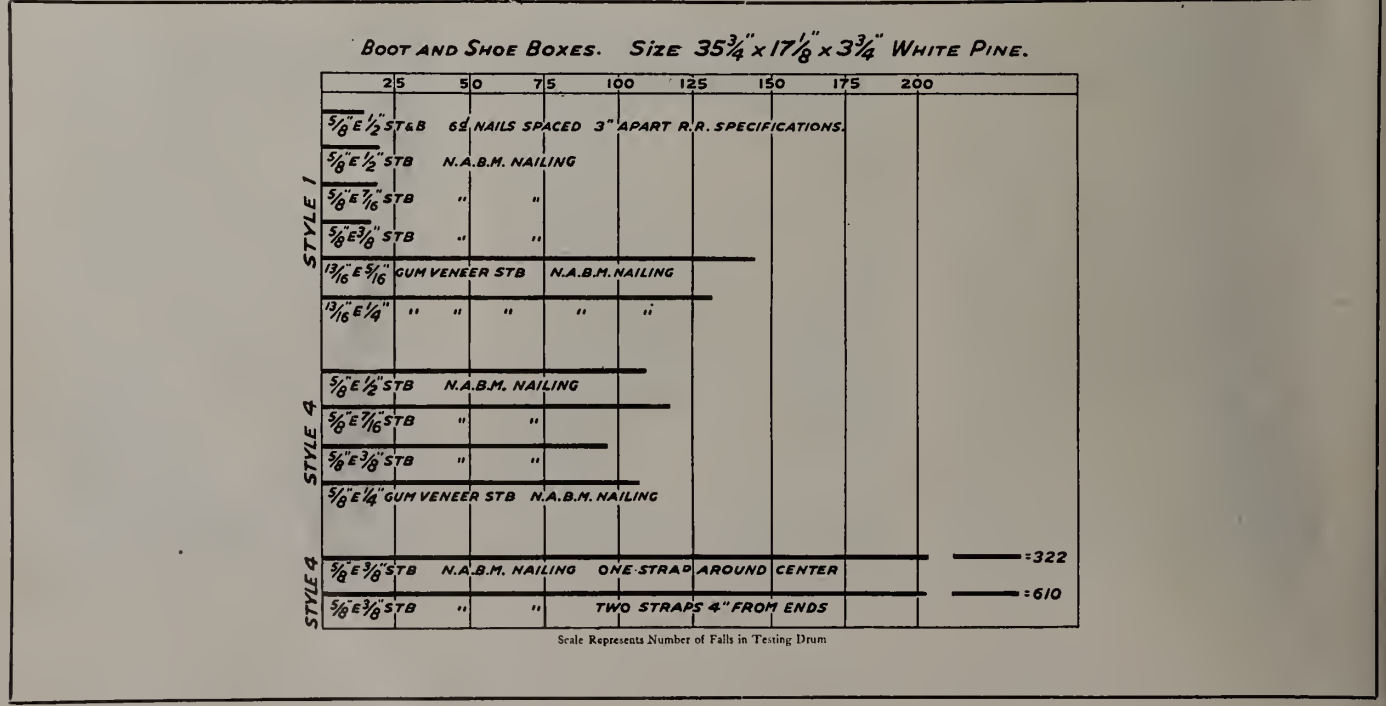
In the first test which was made with a style one nailed box, built of white pine, the black horizontal line indicates that the box failed to last for twenty-five falls. This box had ⅝" ends, ½" sides, top and bottom, and was nailed with 6d nails, spaced 3" apart. The nailing specifications used in this test were those given in the standard railroad specifications for boot and shoe boxes. The longest horizontal line indicates the box lasted through nearly one hundred and fifty falls.

It should be noted that in the boxes which reached the greatest number of falls, the sides, tops and bottoms were of much thinner material than the sides, tops and bottoms of the first box, but the ends were of heavier material. The nailing specifications of the National Association of Box Manufacturers were used, however, instead of the standard railroad specifications. The species of wood determines to a large extent the specifications used by the National Association of Box Manufacturers, and these species are placed in four groups, embracing practically all the woods commonly used in boxes.

The point seems worthy of emphasis that the failure of the box having the ⅝" ends was due to the splitting of the ends, with a consequent opening of the corners. The heavier end which did not split so easily, and which held nails a great deal better, made a box which was much more satisfactory, even to the point of permitting the use of much thinner sides, tops and bottoms. In the last test on the style one box, ¼" lumber in the sides, tops and bottoms, with 13/16" ends, lasted for more than one hundred and twenty-five falls. This could not be appreciated except from a comparison of the life of this box with the life of the first box which was built of ½" sides, tops and bottoms, or double the thickness, and which lasted considerably less than twenty-five falls.

It is doubtful if many shippers have thought of why it is ever necessary, in the use of principal types of wooden boxes, to construct the boxes of heavy lum-

*Chicago Mill & Lumber Co., Chicago, Ill.



ber. Heavy lumber holds nails better than thin lumber. The merits of heavy lumber is in the nail holding power more than in the stiffness or breaking strength of the boards. For instance, in the first series of tests it is shown that when the ends were increased in thickness from 5/8" to 13/16" that 1/2" sides, tops and bottoms could be reduced in thickness to 1/4". Rotary cut gum lumber, one piece stock, increased the strength of the box 100%, with a reduction of 42% in the amount of material used. But, there is little difference in the efficiency of the box built of 5/16" sides, top and bottom and a box built of 1/4" sides, top and bottom, where the ends are 13/16" in each.

The results of the tests on the style four box, where the same nailing specifications were used in all instances, fully emphasizes the comparative unimportance of the thickness of material. There was no appreciable difference between the security of the box with the 1/4" sides, top and bottom and the other with 1/2" sides, top and bottom, both having ends of the same thickness.

Too much emphasis cannot be placed on the importance of a strong end with its corresponding nail construction and the comparative unimportance of the thickness of the material in the sides, top and bottom. The practical application of this principle to your customers' needs will do more to insure satisfaction in service and effect greater economies in packing box costs than any other factor that has been developed in box construction since the introduction of rotary cut lumber and of fibre board boxes for carrying light weight commodities.

The last test shows the effect of strapping. The results as charted indicate that a very high value can be placed upon some form of strapping. One strap increased the strength about 200% while two straps increased the strength about 500%. The straps were applied without nailing, after the boxes are closed.

The Standardization of Canned Foods Cases

Tests to Determine Serviceability—Reducing Thickness of Stock to Minimum and Securing Balanced Construction—Lighter Box But Better Service

By Don L. Quinn*

(Continued from December issue)

The laboratory tests and study of the construction of canned foods cases, of which so much mention is made, were run under the joint supervision of the National Association of Box Manufacturers and the Forest Products Laboratory of the United States Department of Agriculture, with the active co-operation of the National Canners' Association, thereby combining technical and engineering skill with the experience of practical and leading box manufacturers, and of the users. The results obtained proved the wisdom of this sort of co-operation.

Three principal methods of tests were run in order to appraise properly the different effects of all the hazards of storage and transportation, and from this data to build boxes at a minimum of expense which would withstand all those hazards.

A box packed with filled cans was placed in a revolving drum machine, which had in it hazards so arranged that the box would fall in a more or less regular cycle on ends, sides, top, bottom, corners and edges, until its weakest part failed and the contents spilled. The weakest part may have resulted from too few nails or the wrong kind of nails, it may have been too thin ends, allowing the ends to split, or too thin boards in the sides, top or bottom, or from other weaknesses. Whatever it was, that weak part was made stronger, and the box was again subjected to the same kind of falls until another weak part failed, and the process then repeated. These tests also showed up the parts which were too strong compared to the average strength of the other parts, and these consequently were made less strong. As a final result, the weakest factors were strengthened, and the over strong factors were made less strong until all parts were equally strong on an average, and we had what we call a balanced box construction.

Comparative Strength of Boxes.

After this balanced construction was fixed for boxes made of the different species of woods, it became necessary to subject them to drop tests in order to compare one species of wood, when built into boxes, with the others. For instance, a birch box with 5/8 ends and 5/16 sides, top and bottom is so much stronger than a white pine box of the same construction, that it would withstand much harder falls. Since the white pine box was strong enough for the service required, it was necessary to know how much thinner the boards in the birch box could be, and still have as much strength as the white pine box.

These tests, combined with the many, many thousands of tests which had already been run in the Government Laboratory on the strength properties of the various species of woods, permitted the fixing of the proper relationship of thicknesses of lumber when used in boxes. That comparative relationship has since become a definite, fundamental standard of box construction.

These two tests were not in themselves sufficient, for boxes are subjected to other hazards besides falls. It was necessary to test the empty boxes in a compression machine in order to measure their strength when in a pile, or when stacked in a moving, swaying, jerking freight car. Unless the box had sufficient rigidity to stand up under the strains in a moving freight car, or to withstand high piling in a store room, the load would have to be carried by the cans themselves and the box would not be performing all its proper functions.

Rigidity and Strength Test.

In this compression test, the pressure was applied to one corner of the box, with the opposite corner diagonally through the box, in a direct line with the pressure exerted. Pressure was continued in an ever-increasing amount until the box broke up. The amount of pressure was measured in pounds, so that the number of pounds exerted before failure occurred, became the designated strength of that particular box.

These three principal tests—the drum test, the drop test and the compression test—were all necessary

to determine the entire serviceability of the box. Without all of them, no one could surely say that the box would be a satisfactory container for the purpose required.

Other tests were made to determine the holding power of cement coated nails, barbed nails, plain nails and the like, and to determine the number which should be used to balance the strength of the lumber. Tests were also made to determine the effect of moisture in weakening the general construction of boxes; the shrinkage and swelling of woods that result from moisture conditions and their effect on the nails holding the parts together.

All this, however, permitted us to say definitely to the transportation companies that boxes of the specifications proposed by us, for carrying canned foods, would give strength in service beyond that which such boxes now have, and if properly policed, would reduce loss and damage claims, under the ordinary hazards of transportation, to the minimum.

Better Service to Box Users.

To the manufacturer of boxes, we can safely say that regardless of the section from which he may draw his lumber, regardless of the type or kind of wooden box he manufactures, if he makes them according to these specifications, he will be conserving his timber resources to the best advantage. Moreover, he can take just pride in the service his boxes will give his customer. "He will profit most because he will be serving best."

To the canner, we can say: The thickest material required in any species of wood under these specifications is thinner than was tentatively agreed upon by the canners, the wholesale grocers and the railroads in Baltimore in February, 1914. The thickest material is required for Group I and II woods, which specifies 5/8 in. ends, and 5/16 in. sawed sides, top and bottom. These two groups carry species such as white pine, spruce, fir, cottonwood, southern yellow pine and hemlock, to name only a few. In red gum, sycamore and similar species of Group III woods, 1/2 in. ends with 5/16 resawed sides, tops and bottoms, or 1/4 in. red gum veneer are authorized. In the fourth group, which includes birch, beech, maple and the like, 1/2 in. ends and 1/4 in. resawed sides, tops and bottoms are specified. Cement coated nails are required for all boxes. Seven penny nails are specified for Group I woods, six penny for Group II woods and four penny for Group III and IV woods, because these are the largest nails which can be driven into the specified thicknesses without danger from splitting of the lumber. So you see, the allowable variations in thickness and the allowable variation in size of nails are in accordance with the known strength of the different species and their proper nail holding capabilities, and are the minimum thicknesses which have ever been used in these cases. Because of the allowable variation in thickness, canned foods cases to the canners as a whole will be lower in cost than they are now, and much lower than they would ever have been, had the tentative standard fixed at Baltimore been made permanent.

Responsibilities of Each.

With all these benefits—increased serviceability for the railroads, universal practicability for box manufacturers and greater average economy for the canner—there are responsibilities which each must carry. The transportation companies must properly police the containers, and ultimately translate reduced loss and damage claims into lower rates or else into better service. The box manufacturers, being permitted to cut their timber into minimum thicknesses, must eliminate defects, such as rot, dote, knots, knot holes, splits, shakes, etc., which materially affect the strength of the box, and must give his customers sound lumber, cut square and true to proportions. The canner must keep his boxes properly stored, must not nail them up long before they are needed in service, must not store them in a dry heated room after nailing, and above all must see that all nails are driven squarely into the wood flush with the surface, not overdrawn, nor in a crack.

By assuming these responsibilities the railroads, the box manufacturers and the canners will be keeping faith with those in the National Association of Box Manufacturers, National Canners' Association, National Wholesale Grocers' Association, and in the United States Forest Products Laboratory, who have worked so hard, so consistently and so long to secure these specifications which make for the cheapest, yet the best wooden boxes which can be used for carrying canned foods.

Wiring of Boxes for Export

The order of the steamship companies operating between Canadian ports and ports in the United Kingdom requiring that all apples in boxes for export be strapped or wired has been modified to the extent that wiring or strapping is no longer necessary provided the steamship companies are relieved of the responsibility by the shipper for loss or damage resulting from the absence of this device. A number of carloads having no straps or wires have gone forward, and in many cases have shown considerable breakake. A large portion of the shipments have not reached their final destination when discharged by the steamship companies at the sea ports, as large quantities are carried by the transportation companies to the various towns and cities in the United Kingdom, and the reports from these transportation companies show that heavy losses have resulted where boxes have not been wired. These losses in the last analysis are paid for by the shipper in Canada.

In the light of past experience, strapping or wiring apples in boxes for export is cheap insurance against loss and damage in transit and its continuance, notwithstanding in modification of the order, is strongly recommended.

Excellent Time to Make Repairs

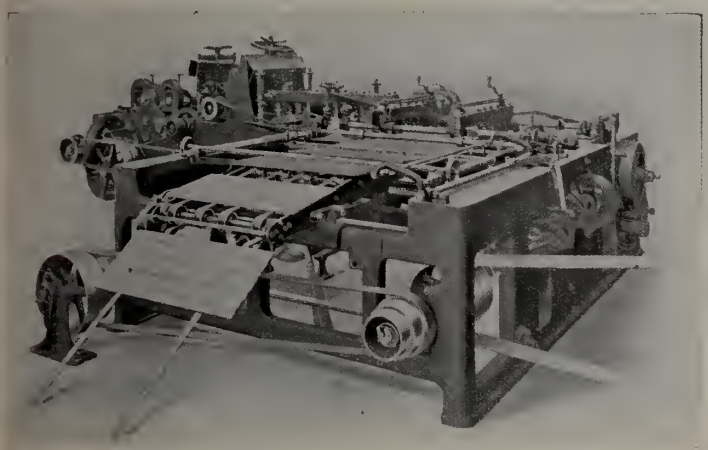
When things are quiet as they are to-day it is a very good time to get the mechanical equipment in the factory well oiled, where special parts are not working. This is a good "fixing time," because it is practically stopping the clocks and closing down the blinds and putting most institutions on a heavy overhead basis; therefore as the foreman and the engineer and the mechanical genius about the plant are on the payroll anyhow it is a pretty good time to see that the mechanical equipment is prepared for more aggressive action during 1921. We hope the employee will get his joints oiled up also and figure on helping to make the plant have a profitable year during 1921.

The value of sand-paper for a belt is determined by the quality of the glue and the cutting edge and life of the grit.

Machinery & Equipment

Automatic Box Board Machine

Boxmakers, no doubt, often wish for a piece of equipment which will take material of uneven widths, and lengths and joint, dress and size a complete box side, top or end in one operation. Such a machine is Bolinder's Automatic Box Machine No. 15 intended to take material, cut to rough length and edge, and to plane, tongue, joint and make up finished box sides and ends to exact dimensions required. The short boards are piled up in the feeding apparatus of the machine and are from here fed into the automatic machine, whereupon the boards, if necessary, are



Bolinders box board machine

planed on either end or both sides and furnished with tongue and groove. The edge is then glued, if so desired, and the boards are joined together. This jointed material is correctly adjusted to length and cut up into widths corresponding to the desired dimensions of the box sides or ends, etc.

For the operation of the machine only two men are required, one young man for feeding the boards into the machine and one for looking after the machine, its planing steel, cutters and saw-blades.

As already mentioned the finished box sides and end, etc., are completed entirely in this machine, without being adjusted or rehandled in any other machine. The maximum rate of feeding is 88 ft. per minute, which for an 8-hour working day using for instance 4 in. x ½ in. 24-inch lumber makes more than 3½ standards or about 7,000 pieces 24 in. x 12 in. finished box sides.

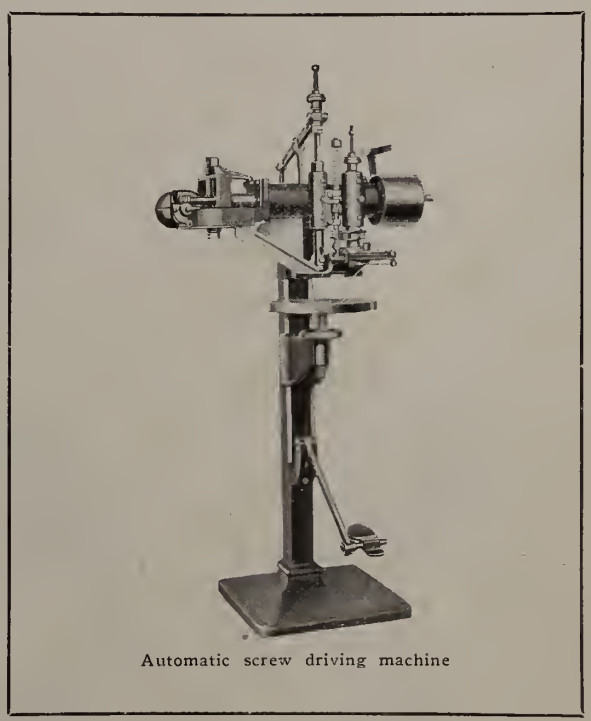
Using three cross-cut saws, double the number of finished sides will be obtained, in the present case for instance about 14,000 pieces 1 in. x 12 in. finished box sides.

Lumber is saved partly on account of the planes being cross-cut before being cut up into boards so that the ends can be used for the manufacture of small boxes, etc., and partly due to the fact that the boards are jointed in the machine, one after the other, without any loss in edging. Besides, there is a gain of about ⅛ of an inch in the width of each board on account of the slight depth of the dovetail joint.

Full particulars may be secured from the Swedish Steel & Importing Company, Montreal, who are the Canadian agents for Bolinders, Limited.

New Type Screw Driving Machine

Of all the tedious and exasperating jobs that occur in light assembling work, that of starting and driving short screws deservedly stands at the head of its class and any device that promises to depose this operation from its evil eminence is worthy of consideration. The Reynolds Machine Company of Massillon, Ohio, had this in view when designing the machine illustrated herewith which rapidly and easily sets screws as electrical binding screws, switch box screws, washer head screws, etc. The machine heretofore built by them have been very successful in automatically feeding and driving screws of ordinary proportions, but so far as is known, no machine up till now has ever been placed on the market to handle screws the length of which is less than the diameter of the head. While designed especially for short screws, this machine is not limited to such, but drives also screws of ordinary lengths and sizes of heads. In operation, screws are thrown at random into the magazine at the right of the machine. This magazine automatically arranges them in single file with heads upward and delivers them in this position into the inclined track shown leading from the magazine. Opposite and close to the lower

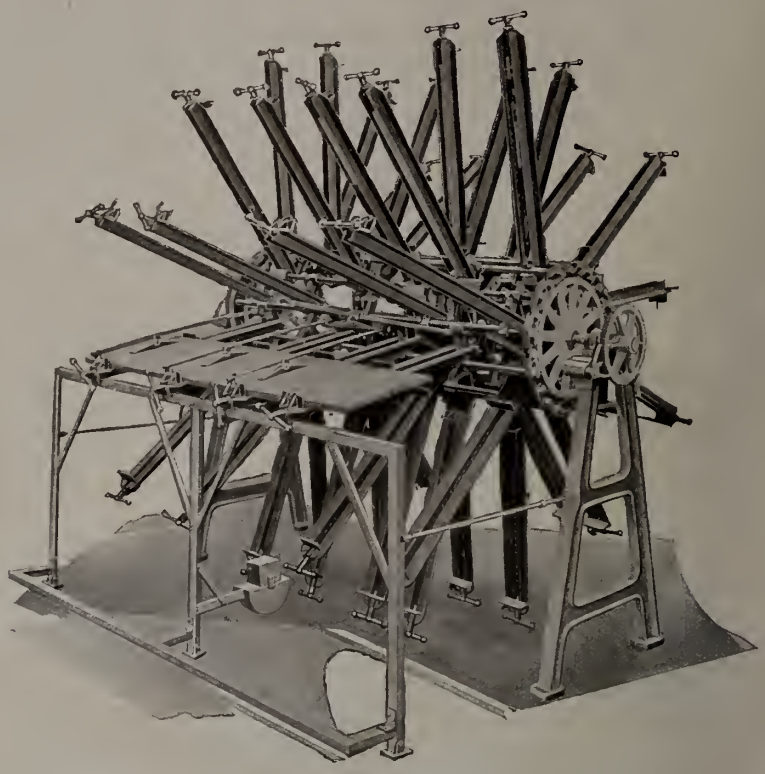


Automatic screw driving machine

end of the track is a finger recessed to receive one screw and hold it in line with the spindle.

The spindle, which carries a screw driver bit, is brought down by the foot lever, the bit engages slot in screw head and finger and screw are carried downward until the point of screw engages work, when the finger

New Yates swing saw.



Convenient small revolving clamp carrier.

is automatically withdrawn to allow the screw to be driven home.

The spindle is adjustably, frictionally driven so that screw driver bit stops when screws are driven as tight as desired, or screws can be merely started, or driven, to a uniform depth. Table is 12 inches in diameter and is adjustable on column to take work up to 15 inches high and has screw for close adjustment. Foot lever is pivoted well above the pedal to give an easy swinging position, and can be adjusted both for position and resistance to suit convenience of the operator. Operation of Machine with foot lever leaves both hands of operator free to handle or assemble work. Spindle may be run several hundred R.P.M., setting screws practically instantly. Machine is driven with tight and loose pulleys as shown, or with individual motor.

Small Revolving Clamp Carriers

A convenient type of small revolving clamp carrier is shown in the accompanying illustration. This machine has been but recently placed on the market by the James L. Taylor Manufacturing Co., Poughkeepsie, N. Y. It is designed to suit the requirements of those who have not sufficient work to warrant the installation of a larger unit or who are handicapped through a lack of space and lastly for those who find it advantageous to have several small clamps in different parts of the factory in preference to one large clamp in some central location. In genertl construction and detail, it is very similar to the clamp described on page 74 of the July, "Canadian Woodworker." It is made in two sizes; 8 or 12 sections. Each size can be secured to handle stock 6 1-2, 7 1-2 or 8 1-2 feet long, as desired, and with any number of clamps to a section. A handy end clamping attachment can be provided. The clamps are adjustable crosswise independently and are the same as those furnished with the larger units. These smaller carriers are in strong demand by piano manufacturers and others: in fact they were first designed at the express request of several piano men.

Full particulars may be had from the makers or from the A. R. Williams Machinery Co., Toronto. the Canadian representatives.

Self-Contained Swing Saw

The accompanying illustration shows a motor-driven swing cut-off saw, the product of the P. B. Yates Machine Co., Hamilton, Ont. The frame is a one-piece casting, braced and flanged to give strength and rigidity. The saw frame is pivoted at a point slightly below the line of the countershaft. This tends to eliminate vibration at the saw as well as tightening the belt as it enters the cut. The adjustable counterpoise ensures an easy return after the cut is completed. The saw is adjustable both vertically and horizontally and both saw and arbor pulley are efficiently guarded. This makes an efficient self-contained machine. It can be secured, in slightly modified form, for belt drive. The size of the motor depends on the diameter of the saw carried. A 14-inch saw requires a 3 h.p. motor; 18-inch saw, 5h.p. motor; 24-inch and 30-inch saws, 7½ h.p. Full particulars may be secured by writing the manufacturers.

Match Factory in Malay Peninsula

As there is a great demand in the Malay Peninsula and near-by countries for matches, the bulk of which is now supplied by Japan and China, the progress of the new match factory which is being erected at Kuala Lumpur will be watched with interest. The factory, which will be in active operation within the next few months, embraces two distinct and independent plants, each with a capacity for turning out from 700 to 750 gross boxes per day of ten hours.

Upholstering and Trimming

Furniture Pulls in Period Designs

Should Harmonize in Finish and Outline—Buying Public Showing Greater Discrimination

By C. R. Read

The style and design of the trimmings and hardware used on a piece of furniture should be given the same close attention and the same thoughtful consideration as the lines and proportion of the article itself. Such items as pulls, knobs and similar forms of decoration, may be considered of little importance, yet it is such seeming trifles that often make or mar the beauty of a piece of furniture.

One often finds furniture in period design, trimmed with hardware belonging to an altogether different style and which as a consequence does not harmonize. This might have been due to an oversight, to lack of knowledge or to the fact that the hardware for that particular period was temporarily out of stock. Whatever the reason, such a practice tends to discredit the piece, and even the whole line, in the eyes of the knowing and discriminating buyer.

The ever-increasing demand for fine furniture in period styles and classic designs is due, largely, to the fact that the general public has at last awakened to the attractiveness and desirability of well-proportioned and well-designed furniture. Coupled with this increased interest and perhaps the very cause of the present-day demand for high-class furniture, is a greater knowledge of, and a closer acquaintance with, the older period styles. To one who has but recently delved into the lore of old furniture, and who has discovered the fact that the furniture and mounts should harmonize in design as well as in finish, the finding of a Queen Anne pull on a Jacobean table would come as a distinct shock. The same applies to one who knows and appreciates period styles.

There is a direct relation between the mounts, hardware and the general design of a piece. One of the most subtle charms of well-designed furniture is the quantity and kind of ornaments and the fact that these and the article itself seem to blend into one harmonious whole. This would apply as much to the color and finish of the hardware used as to its design. This fact must never be lost sight of in selecting and attaching furniture hardware.

The accompanying illustrations show a number of period pulls from the line of Foster, Merriam & Co., Meriden, Conn. The centre illustration is that of a small

Queen Anne 1702-1714

pull suitable for furniture in Italian Renaissance style. It harmonizes in shape, detail and finish with the general characteristics of furniture of that period.

Jacobean furniture is quite popular at the present time. This is usually in oak in a dark or fumed finish. This style is sometimes called Charles II. The term "Jacobean" is all embracing and may be applied to practically all furniture produced between 1603 and

William and Mary, 1689-1702

Italian Renaissance 16th Century

Jacobean, 1603-1660

Charles II., 1660-1685

Adam 1785-1800

Chippendale, 1754-1770

1685, which would include the reigns of James I. and II. and Charles I. and II. This style is solid and substantial in appearance, running to straight lines. Heavy bulbous turnings and twist turnings are often used. Some of the pieces are more or less architectural in appearance. Panelling and mouldings laid-off in geometrical pattern are often used. The two pulls shown in the figures 2 and 3 are very appropriate for furniture in Jacobean style.

The William and Mary style follows next. The furiture of this period is influenced to quite an extent by the Jacobean lines. The pulls for this type of furniture are knobs or small pear-like drop handles. These latter harmonize nicely with the turnings so common to that period. In the Queen Anne furniture these drop handles are replaced by plainer handles in shaped brass. In these pieces the duller finishes are preferable to either buffed or polished brass.

The same remarks apply to the illustrations showing pulls for Adam and Chippendale furniture. These harmonize in detail, general contour and finish with the chief characteristics of the furniture to which they belong, while some of these designs may appear to be applicable to other styles than that for which they were intended, yet correct usage and greater knowledge on the part of the buying public require that every consideration be given to selecting and attaching the most suitable trimming.

Upholsterers Endorse Open Shop

The National Association of Upholstered Furniture Manufacturers, whose offices are located at 110 South Dearborn Street, Chicago, have instituted an open shop campaign for "The American Plan," as it is termed. Mr. Maltby, the secretary of the association, states that 97 per cent. of their membership are now running open shop. He said: "There has been uniform rallying to the open shop standard by manufacturers. The campaign was opened under the direction of Mr. Fennell, our industrial relations director. We have been uniformly successful in Milwaukee, Evansville, Boston, Philadelphia and Baltimore. It is the big work of this association this year. The open shop campaign signs have been called for largely by the manufacturers in the metropolitan centres."

These signs read as follows: "This Shop is Operated on the American Plan."

"Every man and woman working here will be protected in the right to earn an honest living in return for honest work."

"No employee of this company need belong to any outside organization to get justice and a square deal."

Training School for Upholsterers

Quarters.—The floor space is selected convenient to the manufacturing district and of sufficient size to provide working room for at least one pupil for each manufacturer taking part in the plan.

Selection of Learners.—Young men, between the ages of 20 and 25, are selected, preferably those having some responsibilities such as a wife, children or parents to support. These are selected with little publicity, eliminating those with previous exaggerated wages from war work or other special conditions. Not only is the applicant examined but his home is visited to see that conditions there are such as to make him a desirable employee, and his past record is carefully investigated. If found satisfactory to teacher and the factory desiring to employ him, he is then engaged and starts in the school.

Learner's Wages.—Each learner is paid a beginner's wage or reasonable sum weekly by his employer. This weekly wage continues regularly until it is decided by the teacher and employer that the learner is either unfit for further tuition or is sufficiently trained to work in the employer's shop.

Learner's Work in School.—The employer is to deliver to the school materials necessary to make up pieces of furniture. The entire time of the learner, under the supervision of the teacher, is devoted to turning out the work which, before it leaves the school is to be in good marketable condition.

Educating the Learner.—To offset undesirable propaganda, the teacher will each day, at lunch hour, devote fifteen minutes to teaching Americanism and loyalty to employer's interests.

The Teacher.—He must be a practical workman

who understands the art of handling and training men. He is employed at a salary and expenses agreed to by him and the committee of employers.

Control of School.—The school is controlled by a committee selected from the employers taking part. This committee handles the finances, exercises economy in running the school and makes reports to the employers. Funds are provided by a fixed payment from each employer, this giving him the privilege of keeping one learner in the school at all times.

Trained to One Operation

A practical application of the above plan has been made by the Upholsterers' Association, and at least one school is in operation. The advantages are apparent. The attendance at the school is increased, diminished or stopped entirely according to the need for workmen. The learner is earning a large part of the cost of training him; he is trained according to the best practice and in a way fitting him for work in any member's shop. He is trained on one particular operation or on all operations, at the option of his employer. Workmen from the factory can be sent to "brush up" on unfamiliar work or fitted for higher or different work. And, best of all, a class of workmen is developed, loyal, competent and permanent.

Segregation of Operations in Upholstering

The Industrial Relations Department of the National Association of Upholstered Furniture Manufacturers has worked out a training system for workmen by which an unskilled workman is trained to do a fair grade of upholstering work inside of sixty days; and in less than six months an all-round first-class upholsterer is produced. A most remarkable result of this system is that the time required to make a certain article has been reduced on an average 50 per cent.

The standardization of wages was found to be the first necesasry step. It was discovered, by a survey of wages paid in Chicago, that there was a variation in rates on the same work as great as 50 per cent. This suggested time studies on operations and, eventually, an entirely new way of dividing the work among the men.

Formerly, each skilled workman made an article complete. There was no division into separate operations. Naturally, no workman was equally efficient on all parts of his job. If he slighted a part of his work it could easily be covered up in the finishing part. There was no chance for him to specialize on the part in which he excelled or which he preferred.

Now there is a complete text-book on the making of upholstered furniture. The making of each article is divided into seven operations. The proper working-time on each operation is given. Workmen specialize on each operation instead of trying to become proficient in all of them. Wonderful improvement has resulted. Not only has there been the great saving in time and cost, as before mentioned, but the work is done better. Each man is an expert on his own particular operation and serves an inspector for the preceding operator to save himself from responsibility for bad work.

The advantages of the new method are so apparent to upholstered furniture manufacturers that the Industrial Engineer of the Association, Mr. G. D. Pettibone, is now devoting his entire time to applying the system in the various plants.

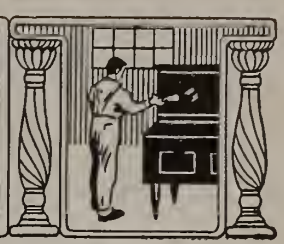
THE FINISHING ROOM



Removing Varnish and Other Finishes

Simple Formulas for Varnish Removers—Suggestions Tending for Satisfactory Results—How the Removers Should be Handled and Applied

By John N. Moore

There are many cases where woodwork has to be refinished in the finishing room of some of our modern manufacturing plants. In practically all cases a refinishing job cannot be effectively done when the old varnish remains. It is bound to detract from the appearance, and should be entirely removed to insure the best work.

If the old coating is in good condition, it will need only a rubbing off with fine sandpaper or a handful of steel wool to remove the gloss and leave a proper "tooth" for the new coat of varnish. In the old days they used to take off this coat with the scraper, sandpaper and perhaps alcohol. Then there is glue which will pull the old coating off clear to the wood. but in these modern times many commercial removers are on the market, and are equally effective, having found a considerable use. Many of these are put out by various paint manufacturers under trade mark names and do very good work. There is another old form of remover and that is ammonia. Still another is potash, and in fact, any caustic, such as lime, will do the work. It is simply a question of convenience and character of the work that is to be done, which determines which remover to apply.

Working With Banana Oil

A few notations covering this subject will prove interesting, and, we hope. helpful. Banana oil is much in favor with painters in removing old varnish. While some object to its odor, it does not injure the flesh or the brush, but eats rapidly into the old finish, clear down to the wood if not checked, but it does not injure the wood itself, only you may not want the filler to be disturbed.

This banana oil is so energetic that in case you wish the surface only removed, you had better try something not so strong in action. One good plan is to mix banana oil or liquid with alcohol in such proportions as will meet the requirements of the case in hand. Such a remover will eat off the first coating immediately and leave the surface in prime condition for refinishing. Simply rub it off with a rag which has been moistened in benzine. As this liquid remover dries very fast it will not do to take too large a surface at a time. Wet a small part and remove the soft stuff as quickly as you can, for if left to dry, the old varnish becomes nearly as hard as at first.

Be careful when using such liquids that the room in which you are operating is well ventilated. If working in a closed room the workman who becomes dizzy or in any way below normal should get out in the open air as quickly as possible, especially where wood alcohol is used the fumes are injurious and all this seems in favor of the purchase and use of some of the standard paint and varnish removers. In using any of them care should be taken not to get down into and injure the filler, and to prevent this the soft varnish should be removed at once, just as quickly as it commences to lighten up. Wash off with benzine and a rag just as soon as the varnish has softened.

Wax Retards Rate of Evaporation

Use all of your removers economically. By that we mean, don't waste them, make every drop do its part. Such liquids are prone to evaporate quickly. The addition of a substance like wax serves to retard this hasty evaporation. About the best wax for this purpose we believe, is cerisin. Without this addition it will be almost impossible to handle some of these volatile liquids, but with the use of the wax, the spirit is held in check so that it will remain long enough to do its work effectively. This method will also enable you to work a larger surface. Practically all commercial removers contain a retarder which forms a coating that keeps out the air and keeps the fugitive spirit in which is a good point.

We are giving a formula for a fusil-oil-benzole remover. It will be found useful for softening old varnish and paint brushes, for removing tar, varnish, lacquer, enamel, paint, etc. Mix together four ounces of benzole, three ounces of fusil oil and one ounce of denatured alcohol. You should observe the same proportions for making larger quantities.

The merit of a varnish remover can usually be determined by the time it takes to eat into the old varnish. In its most effective form it will begin at once to eat into the old film. This is quite important in the case of upright or overhead work where the liquid is apt to run down. By quick action the liquid takes hold of the old surface and does not run. Some of the commercial removers are prepared in a sort of semi-liquid form, which is a great aid in accomplishing this kind of work. Removers containing wax or some equally effective retarder are therefore useful on work of this character.

Alcohol Often Employed

Where the varnish coating is not hard and thick you frequently find alcohol a very satisfactory remover, and the alkalis are often all that is required. Salsoda and water in certain proportions will do for some kinds of work. Alkalis eagerly attack oils, and as varnish. including shellac, is largely a composition of oil, it will be seen that alkali is the thing to turn the trick. Of course it has its objectionable features, in fact, most removers have. When using a form of alkali remover, as soon as it has been applied you may take a wad of steel wool or even sandpaper and go after the spots that have become softened under the action of the alkali. A stiff bristle brush is also used for cleaning out small parts of mouldings, carvings, etc. When all the stuff is removed apply a wash of acid to neutralize the alkali. or wash off with plenty of water.

It is best where you can do as large a piece of the work as possible to let the material stand for some time before trying this. Usually only twenty minutes or

a half hour is necessary. If, when you try it, the old varnish does not loosen up readily, give it another spread and let it stand for a little while longer. The purpose is to get the whole mass loosened up before washing off. A lot of time can be wasted in working on small spots or surfaces, and provided your remover is the right kind this will not be necessary.

Always keep the container well stopped as there is always liable to be a loss from evaporation. While there are a number of formulas accessible for the making of removers we believe the good standard brands will do the best work, just the same as ready mixed stains or enamels are often an improvement over the the hand mixed varieties.

Could Work of Varnish Sprayer be Improved?

Intelligence and Efficiency of the Operator Big Factor—Certain Points that Tend for Better Results—What is Best Air Pressure for Varnish?

By A. E. Smith

The air-finishing equipment or varnish sprayer like any other piece of machinery, requires a certain amount of attention and humoring for best results. One often hears these machines condemned because of certain undesirable features when the fault lies entirely with the operator, the way he manipulates and handles the sprayer and finishing materials. It is well to remember that spraying equipment is in general service, is being used on a wide variety of articles, for many different finishes, and in giving good results. If you are experiencing difficulties either with the sprayer itself or in the quality of the finish, it is well to do a little investigating and experimenting before condemning the machine.

Some Pertinent Points

There are a number of important factors which affect the work done on a varnish sprayer and which must be given careful attention before absolute satisfaction can be expected. They are: temperature of work, room and material, air pressure, purity and dryness of air; cleanliness of work and finishing room; care of sprayer; quality and condition of materials applied, and, lastly, intelligent operation. Without intelligent operation, and, perhaps careful supervision, it is highly improbable that the above features will be correctly controlled and regulated. Skilled operators of this important machine are in good demand, so it is the part of wisdom for all finishers using a varnish sprayer to thoroughly master all the intricacies of this method of applying finishes.

Anyone familiar with the application of finishing materials knows the importance of temperature regulations. A good finisher would not think of applying chilled varnish neither would he consider applying a varnish coat to a cold surface. The same applies to the varnish sprayer, perhaps, even to a greater degree. The temperature of the finishing room should also be evenly maintained at a satisfactory level.

Should Heat be Used?

The advisability of using a heater to warm the material before its application is often questioned by the operators of spray machines. Some use the heater for most of their work while others disregard it altogether. For enamels and varnishes or any material containing varnish, the heater offers certain advantages that are worthy of consideration. By applying such material warm, a heavier coat may be given, thus eliminating one or more coats, effecting a saving in time, labor and material. If the material is applied warm to a warm article, it will flow out more evenly, giving a smoother surface, one that requires less rubbing down, reducing the time consumed in polishing.

The air should be pure and clean, goes without saying, but it must also be free from moisture and oil. Moisture or water in the air results in a spotted finish, while oil causes a mottled effect. A device for removing moisture from the air line was described on page 111, of the December "Canadian Woodworker." The air receiver should be drained regularly, once or twice a day. The oil is removed by inserting a suitable filter in the line. It is not enough that a device for removing the oil or moisture from the air be installed. After being put in, it requires a certain amount of attention to keep it in proper working order and make sure that it is doing its work.

Air Pressure of Prime Importance

Air pressure is an important question, one that to a certain extent must be decided by each individual operator. Some general pressures might be given, such as 50 to 80 lbs. for varnish, 30 to 40 lbs. for stains, and 30 to 50 lbs. for shellacs. Such factors as the quality of the finish desired, the grade, viscosity and volatility of the material being applied, must be given consideration when deciding on the most suitable air pressure.

Another point that is seldom considered is, at what distance from the work should the nozzle or "gun" be held to give the best results. It is good practice work as close to the surface as is consistent with good work. There is less material wasted and a better surface secured if this suggestion is followed. A good rule for all spray operators is to keep close to the work, say 6 or 8 inches, and use the lowest air pressure that will break up or atomize the material.

Oil and Turps Reach New Low Level

The market for linseed oil, turpentine and white lead has begun to steady down again after a somewhat spectacular drop from the prices prevailing in the spring and summer. Paint manufacturers now think that prices have at last reached a rock bottom level. In linseed oil the summer price was $2.80 per gallon of nine pounds for the raw oil. It is now selling at about $1.15 per gallon. For the boiled oil the summer price was $2.83. Now it is down to $1.18. In turpentine the summer price was $3.77 per imperial gallon, now it is $1.55 per gallon. In white lead the summer prices were $19.50 for five-ton lots, $20 for one-ton, and $20.33 for lots of less than one ton. The prices are now quoted as $17.25 for five-ton lots, $17.75 for one-ton, and $18.10 for lots of less than one ton. One reason given for this decline in prices on finishing materials, is that there was a shortage of these products during the last summer but now that supplies have become more normal, values have naturally declined.

Phases in the Development of Wood Finishing

Interesting Sidelights on Development of Finishing Methods and Materials— How Some of the Modern Finishes Came About— Relation of Filler to Stain

By C. J. Lavallee*

Wood finishing is rapidly taking its place among the recognized arts. This may sound extravagant. Nevertheless it is truer to-day than it ever was in the world's history. The cause of it is doubtless the marvellous growth of the furniture manufacturing industry and the influence of this on interior decoration. Some of the finest examples of furniture designing that we have to-day are products of the master craftsmen of centuries ago, and while we see modern designers copying the ideas of these old masters, we also see vast improvements over the old methods and processes of finishing. In this we have gone beyond the wildest dreams of Chippendale and his contemporaries.

Not that finishing is on a higher plane than formerly. The old-time finisher filled the pores of the wood with coat after coat of varnish, scraping down each coat until, after a long space of time, the surface was level; insuring a very fine and highly durable finish. But he consumed months where the modern finisher consumes days. With the latter, volume and speed of production are paramount. The old methods are ruled out by their slowness. While latter day methods may have sacrificed some measure of quality and durability, the loss is so small as to be almost negligible when the gain in efficiency is duly regarded.

Finishers Inspired By Nature

It has been truthfully said that there is nothing new under the sun, and the staining and finishing line is no exception to the rule. Looking back over the years, we see numberless inventions which astounded and amazed the world. The application and the working out of the idea might be new, but in nine cases out of ten the idea itself was not new. So in the finishing line. We claim to have made great discoveries and improvements, and we have, but where did the underlying ideas come from? They came from nature, and all that we can do is to imitate the effects of the sun, the rain and the years.

The old masters must have realized that their main difficulty lay in properly finishing their work in order to protect and beautify it. Hence, in order to avoid filling and its attendant troubles, they used, in most cases, close-grained woods. The finishing on these consisted of painting and varnishing. Some of the old pieces made by Sheraton had the panels painted by Angelica Kaufman, a German woman, whose long residence in England anglicized her to a great extent. Her medallions are exquisite examples of the art of that period. Most of her subjects were taken from Greek mythology.

It is curious in observing the trend of those times, to notice how fast they changed from the thin, spindly designs, to the heavier, massive creations made out of harder and more open-grained woods. To the student of evolution it presents an interesting study. He can look around him to-day and readily pick out shades and designs upon which the past has put its stamp.

One of the most artistic and popular finishes of the past was the Mission, and we can directly trace its origin to the Mission period of certain parts of our country. The term "Mission" formerly meant a style, but now it signifies a finish as well as a design. This period has had a tremendous influence upon the shades and finishes in vogue to-day.

Denninger, of Mayence, Germany, was one of the earliest to devise processes for the staining of wood. He confined his attention almost entirely to alcoholic mixtures, because at that time, to stain a piece of wood took a week or longer. Where water stains were used the pores of the wood were opened so widely, and the grain raised so badly that a good finish was almost an impossibility. Hence his attempts were all confined to a stain of a spirit nature.

His efforts, contrasted with the customs in vogue to-day, were very crude and depended to a great extent upon reactions which took place upon the wood itself. For instance, if a golden yellow were wanted, he would saturate the wood with a solution of tin chloride, and then place it in a tight room where it would come into contact with the fumes of sulphide of hydrogen. A reaction would of course take place on the wood and a golden yellow compound be formed known as tin sulphide.

Other of his processes called for boiling the wood for as long as a day in one bath and then an equally long time in another before the staining was complete. He was strongly opposed to the use of such violent acids as hydrochloric, sulphuric, etc., believing they had a deteriorating effect upon the materials used in finishing the wood. Denninger is but one of a number, during his time and after, who worked upon stains for wood with more or less success.

Advent of Wood Dyes.

The wood dyes came in about this time. They were an improvement on the metal solutions and for many years were considered standard. However, no great strides were made until the discovery of coal tar derivatives, from which time is dated the birth of the wood stain business. The history of the discovery of the various colors reads like a romance. Many of them were made, accidentally, by some old German chemist who, hunting for something else, unsuspectingly put the right reagents together. Others were worked out systematically. Coal tar has proved so prolific that no prophet can say how far it will be developed.

Until about the year 1890 wood finishing had been going along the even tenor of its way, with but few radical changes. Oak was beginning to be appreciated as a cabinet and building wood, but its possibilities had hardly been dreamed of. About that time the 16th Century fad came into favor, but it did not last long, and the Antique followed, which was produced by coloring the filler.

The Age of Golden Oak.

The real awakening began about 1898, when, through an accident, that most beautiful and effective finish, Golden Oak, was born. There never was a finish that brought out to such an advantage that king of our native woods, the white oak of Indiana and

*President, Marietta Paint & Color Co., Marietta, Ohio.

northern Ohio. It is still popular, and the fact that it is being imitated on all cheaper woods proves my assertion. This finish, or effect, has remained in favor longer than any other special finish since oak has been used in furniture.

It was at that period that I entered the ring as a manufacturer and if modesty did not forbid, I might say that the keystone in the arch of our success was Golden Oak. This required so much research work in the laboratory that it has since been comparatively easy to meet the issues, as one after the other, the different effects on oak have been evolved. Let us take as an example weathered oak.

Weathered Oak.

The original of this was not a finish at all, but rather an effect produced by long years of service under exposure, which accounts for the soft, indescribable mixture of gray, green and brown, which has been so aptly called "weathered." In the early stages of this fad, we attempted to reproduce this effect and succeeded, but it could be done only with an acid or water stain and, on account of the great amount of labor necessary to effect a correct finish, it could be used on but the finest examples of this design.

The maker of a medium grade of mission furniture soon discovered that a more economical method of finishing must be devised, so he came to us with his problem, and we solved it with our Spartan process; enabling him to reduce his finishing cost about 50 per cent. without materially affecting the quality or the artistic effect of the result. I firmly believe that "weathered oak" would have retained its popularity, if the original idea of adhering to the mission design had not been lost sight of. The artistic merit of this finish brought out "weathered oak" on all kinds of furniture of no particular design, making it so commonplace that people of refined tastes soon demanded a more exclusive effect, and from the ashes of the weathered arose the "Early English," erroneously called a mission finish.

Early English Not "Mission."

The true Mission shows an open pore and depends entirely upon the depth and beauty of tint for its effect; while Early English is a solid finish—the pores being filled to produce a smooth, level surface. It shows the beauty of the oak by contrast, accentuating the high lights in the same manner as the Golden Oak but much more subdued. Early English also has been very popular and still retains some hold upon the people, but for the same cause that marked the decadence of the Weathered, it is being displaced by that most beautiful and artistic effect, the Fumed Oak.

This effect, as its name implies, was first obtained, and still is, to a certain extent, by exposing the oak to the fumes of ammonia, then coating over with shellac and rubbing dull. On some pieces the result was most beautiful. Fumed Oak was at once favorably received by the trade and promised to become very popular, but on account of the great difficulty in producing a uniform effect on the various kinds of oak used in cabinet work, it was soon seen that it was not as simple an operation as had at first appeared, and the great majority eliminated it from their lines for the time being, so that not much was done about it for several years.

Fumed Oak Still Lives.

However, as has been the case with nearly all new finishes that have real merit, fumed oak did not die out. A few of the more persevering ones kept experimenting until a process was found that enabled them to produce a reasonably uniform color effect on nearly all varieties of oak, but here again, it was an expensive operation.

We had been watching developments all this time, and as soon as the demand for this finish forced the trade to add it to their lines, we were ready to offer our acid stain, enabling them to compete successfully with as high grade a finish and effect as the original, but at a much lower cost. The trade was quick to see the merit in this process, and this finish jumped into favor at once, so that there is now scarcely a manufacturer of wood work that does not offer a fumed oak line.

This is a fair description of the birth and growth of some popular fads and fancies in the finishing world.

If these several finishes remained true to the name, so that a standard could be established, the manufacture of stains would be a simple operation. But we have no sooner mastered a certain shade, or tint, than we are asked for something more on the brown, or green, or gray—or a little darker or lighter, until out of the maze we usually manage to evolve a medium shade, which is used as a standard, and after a time it becomes so in fact.

As I said in the beginning, many of these effects (some of them most artistic) are named after Old World master designers, and not the particular shade or color used in his day to bring out the best in that design. As, for instance, we are suddenly requested to furnish a stain to produce a Flanders effect on oak. We know that the name implies a design only, but being familiar with the period when this design was brought out, we soon evolved a stain that produces the required effect. The same can be said of the Flemish, the Baronial, the Sheraton, the Chippendale, the Cathedral, etc. There is this to be said, however, of the Cathedral. It conveys more meaning to the mind of one familiar with the subject than any of the others above mentioned, because, while it denotes a special design, one can readily picture the effect of the light shining through the beautiful art windows in one of the mammoth temples of the Old World, blending the ambers, greens, blues, yellows and reds in one harmonious golden brown tint.

Silver Grey formerly produced only by boiling the veneers in a solution of sulphate of iron, is now satisfactorily made with an acid stain applied with a brush, making it possible to get the effect on all kinds of cabinet work. It is usually correct only on maple, however—a special stain being necessary on other woods.

Difficulty With Mahogany.

We now come to mahogany. For many years an acid or water stain has been used with good results on all kinds of woods, but like all successes, it has its drawbacks, and one of the most serious of these is the raising of the grain of the wood. On built-up furniture, it is especially objectionable, on account of the water swelling the wood and breaking the joints. Then again, the veneers used in many instances are so thin that when soaked with water they blister badly and often have to be removed and replaced at great expense. With these points in mind, it is not difficult to appreciate the demand for a so-called oil mahogany stain.

The first question that arises is—what are the chief claims for or against an oil stain? If I were asked that question, (speaking of a genuine oil stain) I would say, that for a surface exposed to the elements, such a stain is the best, from the fact that being made by

MACO

New Principle Non-Fading Stain

¶ Under ultra violet ray test it endured the equivalent of thirty days in bright sunshine without the slightest tendency to fade.

¶ It penetrates without raising the grain of the wood.

¶ It can be filled directly over like a spirit stain.

¶ Has the advantages of an oil, a spirit and a water stain with none of their disadvantages.

¶ Write for sample panel and full particulars.

MARIETTA WOOD FINISH SPECIALISTS

reducing pigment colors with oil, turpentine, etc., it covers and protects the surface as would a thin paint, (which in fact it is). It naturally retains its color longer, but for interior finish where a real wood tint is desired, the day of oil stain has passed, because it is necessarily made from pigment colors, and lacks altogether the depth and brilliancy of the acid or water stain. We must then look elsewhere for a material which possesses these qualities, and at the same time is entirely soluble in the proper vehicles. This we find in the coal tar dyes, known as the oil soluble group. In this group can be found almost every color of the rainbow, and by blending intelligently most of the effects obtained with acid colors can be duplicated quite satisfactorily.

There is this exception, however, that these stains do not possess the mordant properties of an acid, and are therefore much more transparent; hence the clearness and great brilliancy. In some instances this is considered an advantage but owing to the fact that most of the stains are made to match a water stain, it was necessary that some way be found to overcome and diminish what at first seemed to be its chief claim. This demanded another long series of experiments, and after many attempts the solution was found to rest in the proper mixture of the several coal tar solvents, and especially prepared alcohols.

Essentials of Modern Stain.

A number of delicate points had to be kept in mind:

First: The combination of ingredients must be correct in shade.

Second: The vehicles must be so well balanced that the whole would be in perfect solution.

Third: It must penetrate deeply into the fibre of the wood.

Fourth: It must not raise the grain.

Fifth: It must evaporate absolutely, and yet leave the stain properly bound, and lastly, it must hold its color reasonably well, at least sufficiently to compete in non-fading qualities with the water or acid stain. We started a long series of laboratory experiments with all the known reagents, following our motto of looking backward, only that we might more surely move forward and avoid past mistakes. The result was a glaze, or toner—permanent in color—absolutely transparent and perfectly practical of application. This was followed recently by the introduction of a new non-fading stain that has all the advantages of an oil stain combined with the non-fading qualities of a water stain.

Points About Fillers

A word or two more about paste fillers. Two points in particular are very important; the first is the close relation of paste filler to stains; making the color of the filler often as important as the stain itself in producing a certain effect or tone. The second is the difference in the quality of fillers. I have many times marvelled at the indifference manifested by users of paste fillers in general. Some select the filler for the color, others simply to fill the pores, seeming to forget that both qualities should be found in a well-balanced filler. But there is one point that is being insisted upon by the discriminating buyer after he has been shown the advantage of it, and that is—the filler, in addition to all the requisites mentioned above, must dry so hard, that one coat of finish can be omitted without impairing the beauty or durability of the work.

In the brief space of this brochure, I have tried to give some idea of the history of wood finishing—its evolution through various stages leading up to its position of importance to-day. Volumes could be written on this subject to cover it thoroughly, but I have undertaken the barest outline. I feel it to have been my personal good fortune to have been able to contribute somewhat to this development, but am especially gratified at whatever success I may have achieved in translating the purely theoretical or experimental knowledge of the laboratory into the practical knowledge of the finishing room.

How to Test Linseed Oil

Linseed oil is the base of many materials found in the finishing room. Unless a good grade of oil is used, the resultant mixture, whether filler, paint, enamel, etc., will in all probability be very slow drying and may exhibit other objectionable features. Unless the finisher knows how to test linseed oil, he may, unwittingly, be using an adulterated or inferior grade of oil.

There are a number of simple tests which may be applied, some of which are more or less accurate. Some finishers, who are of an observant nature and who have had years of experience in working with and handling linseed oil, may be able to judge the quality of a sample of oil by such qualities as smell, taste and "feel," but these men are few and far between and at the best this test is comparative and by no means accurate. Again, others use what is known as the acid test. By placing the oil and acid in a test tube, together, and mixing them, if the oil does not change color, it may be considered of a good grade. On the other hand, if it does change it is presumed to be doctored or adulterated. As certain oils, which are known to be adulterated, do not show a change under the acid test, it cannot be considered to be reliable, unless, of course, a change of color should take place.

One of the simplest and, at the same time, most reliable tests, is what might be termed "the boiling test." It is a well-known fact that linseed oil has the highest boiling point of any oil. Taking advantage of this fact, determining the temperature at which a sample begins to boil, will enable one to form a very accurate idea of the quality and purity of the sample under test. The apparatus needed is very simple, consisting of a small iron pot, alcohol lamp and thermometer. This latter should register as high as 700 or 800 degrees.

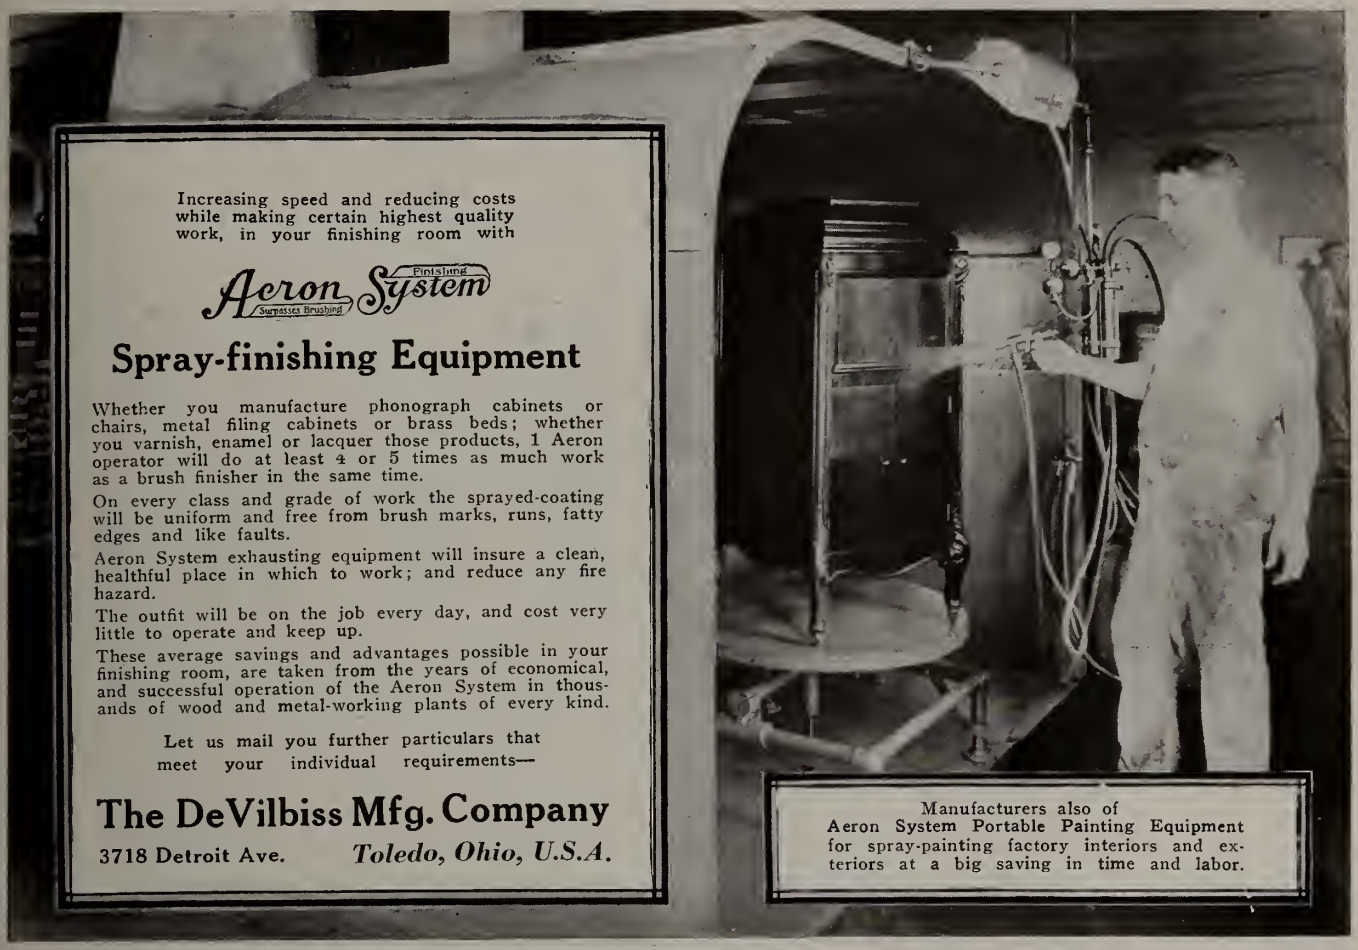
Place a few ounces of oil in the pot and heat until it boils. If the oil is pure, this will be in the neighborhood of 550 degrees F. When the oil has reached 475 degrees, 500 degrees it will flash; that is, the oil will ignite if a burning match or taper is held about ½ inch above the surface of the oil.

An adulterant often employed is cottonseed oil. This has a very low flash and boiling point. Linseed oil, to which cottonseed oil has been added, can be readily detected by its low boiling and flash points. If linseed oil boils at a temperature lower than 535 or 540 degrees, it is either of a very low grade or has been mixed with other oils.

Walnut Manufacturers to Meet

The annual meeting of the American Walnut Manufacturers' Association will be held at the offices of the Association, 616 South Michigan Boulevard, Chicago, Illinois, on Thursday, January 20, 1921.

A dry kiln should be capable of handling all kinds of lumber. It requires, however, capable supervision to adjust conditions to suit the different stocks.



Increasing speed and reducing costs while making certain highest quality work, in your finishing room with

Aeron Finishing System (Surpasses Brushing)

Spray-finishing Equipment

Whether you manufacture phonograph cabinets or chairs, metal filing cabinets or brass beds; whether you varnish, enamel or lacquer those products, 1 Aeron operator will do at least 4 or 5 times as much work as a brush finisher in the same time.

On every class and grade of work the sprayed-coating will be uniform and free from brush marks, runs, fatty edges and like faults.

Aeron System exhausting equipment will insure a clean, healthful place in which to work; and reduce any fire hazard.

The outfit will be on the job every day, and cost very little to operate and keep up.

These average savings and advantages possible in your finishing room, are taken from the years of economical, and successful operation of the Aeron System in thousands of wood and metal-working plants of every kind.

Let us mail you further particulars that meet your individual requirements—

The DeVilbiss Mfg. Company

3718 Detroit Ave. *Toledo, Ohio, U.S.A.*

Manufacturers also of
Aeron System Portable Painting Equipment
for spray-painting factory interiors and exteriors at a big saving in time and labor.

High Grade Stains and Fillers

In our Stains you will find the highest possible color values—they are positive—they are permanent. Manufactured in quantities from the best quality raw materials.

Wood Fillers also that have been tested under the most difficult of varying circumstances and found satisfactory.

Eliminate trouble in your finishing department by using these tested materials.

PERIOD FINISHES AND FURNITURE

It is just as important that the finish of old furniture be duplicated as the design.

We have made a thorough study of this subject and have prepared a booklet called "AD-EL-ITE PERIOD FINISHES," showing how to accurately and economically reproduce the finish on any period style, such as:

Adam Brown
Antique Mahogany
Antique Walnut
Sheraton, Adam
Jacobean, Etc.

It also contains an interesting history of Period Furniture and of the old world cabinet makers.

Write for this valuable booklet. It's free. One of the many features in the AD-EL-ITE SERVICE to furniture finishers and manufacturers.

All Cats Look Grey in the Dark—

And all makes of abrasive papers *look* pretty much alike. But when they're tried out, up jumps the "difference".

For instance—

In Detroit, one day last summer, P. Landen, foreman of the finishing department of the Sewell Cushion Wheel Company, ran tests on several brands of abrasive papers.

Speed-grits sanded an average of 124 wooden wheels before it wore out, to its nearest competitor's 30. Today, you'll find Manning Speed-grits doing 100% of the sanding work in this plant.

Then comes this report from the Manning Philadelphia salesman:

"Called on Mr. Paul Weaver, of Weaver's Art Shop. He said, "Kafka, I don't know when I can give you another order—your goods last so long. The one on the machine has been in use for six weeks and it's still good." (Note:—The disc actually lasted 8 weeks, sanding approximately 6400 pieces—soft and hard wood and composition which is harder than wood.)

Now skipping across country to Rockford, Illinois, we meet Ed. Pettit, foreman of the sash department of the Rockford Builders' Supply Company. He uses Speed-grits—No. 1½ Garnet Paper, 6 inch—on his big sander. When asked about performance he said, briefly but clearly, "It's the best d - - n paper I ever seen."

But why go on. There is a difference between Manning Speed-grits and "just" sandpaper and—"*Good Workmen Know the Difference.*"

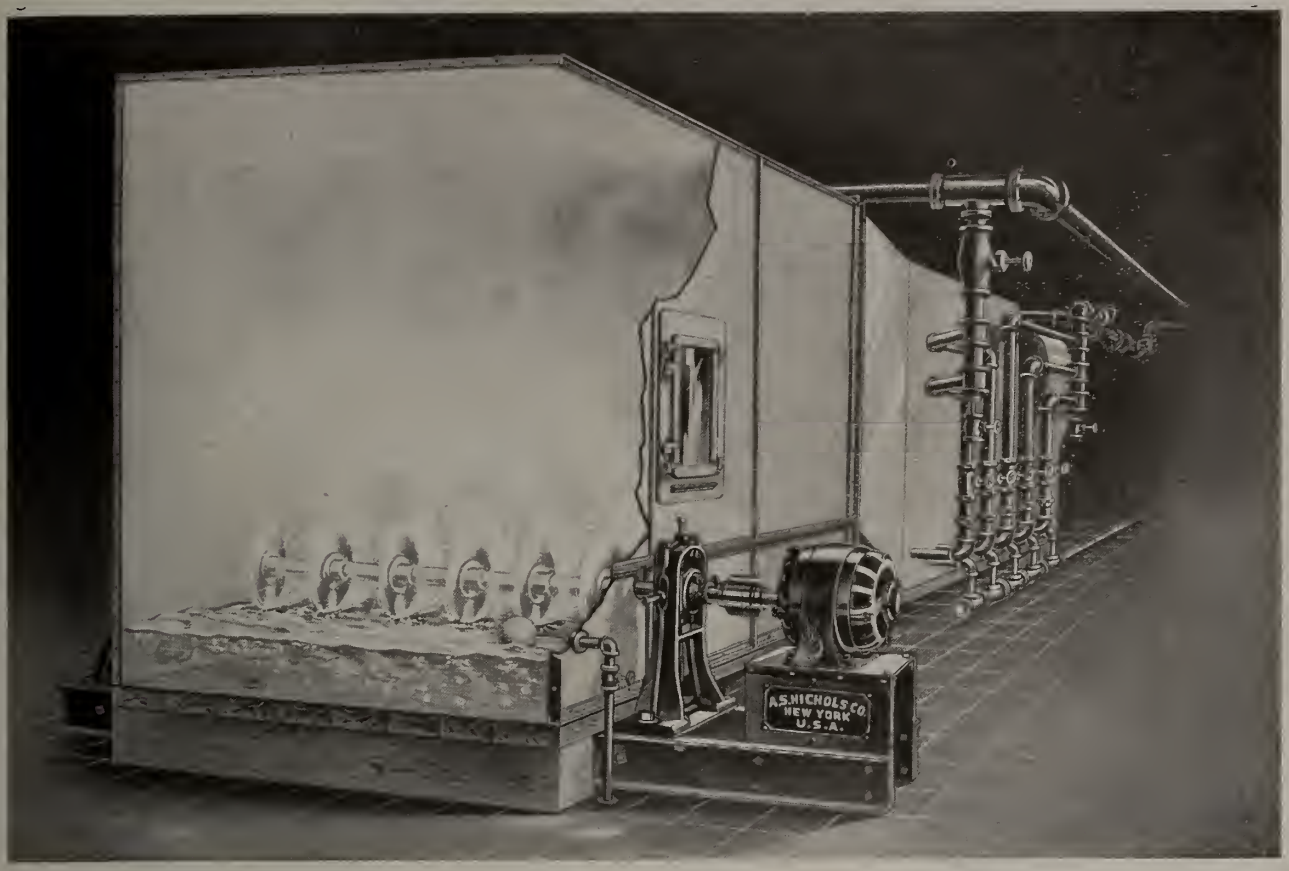
Look for this trade-mark on the back of every belt, sheet or disc.



The above photograph shows our complete Varnish Drying Equipment showing air washer and humidifier in operation. These dryers may be used to turn out automobile bodies, furniture, pianos, talking machines, etc., in as many days as it formerly took weeks, and the finish is better, for it is dried scientifically, from the inside out.

If not already Nichols equipped, you owe it to yourself at least to investigate, because:—

1—It will easily triple the output of your finishing rooms.

2—It will decrease congestion in your factory.

3—It will decrease the investment in goods necessarily in process.

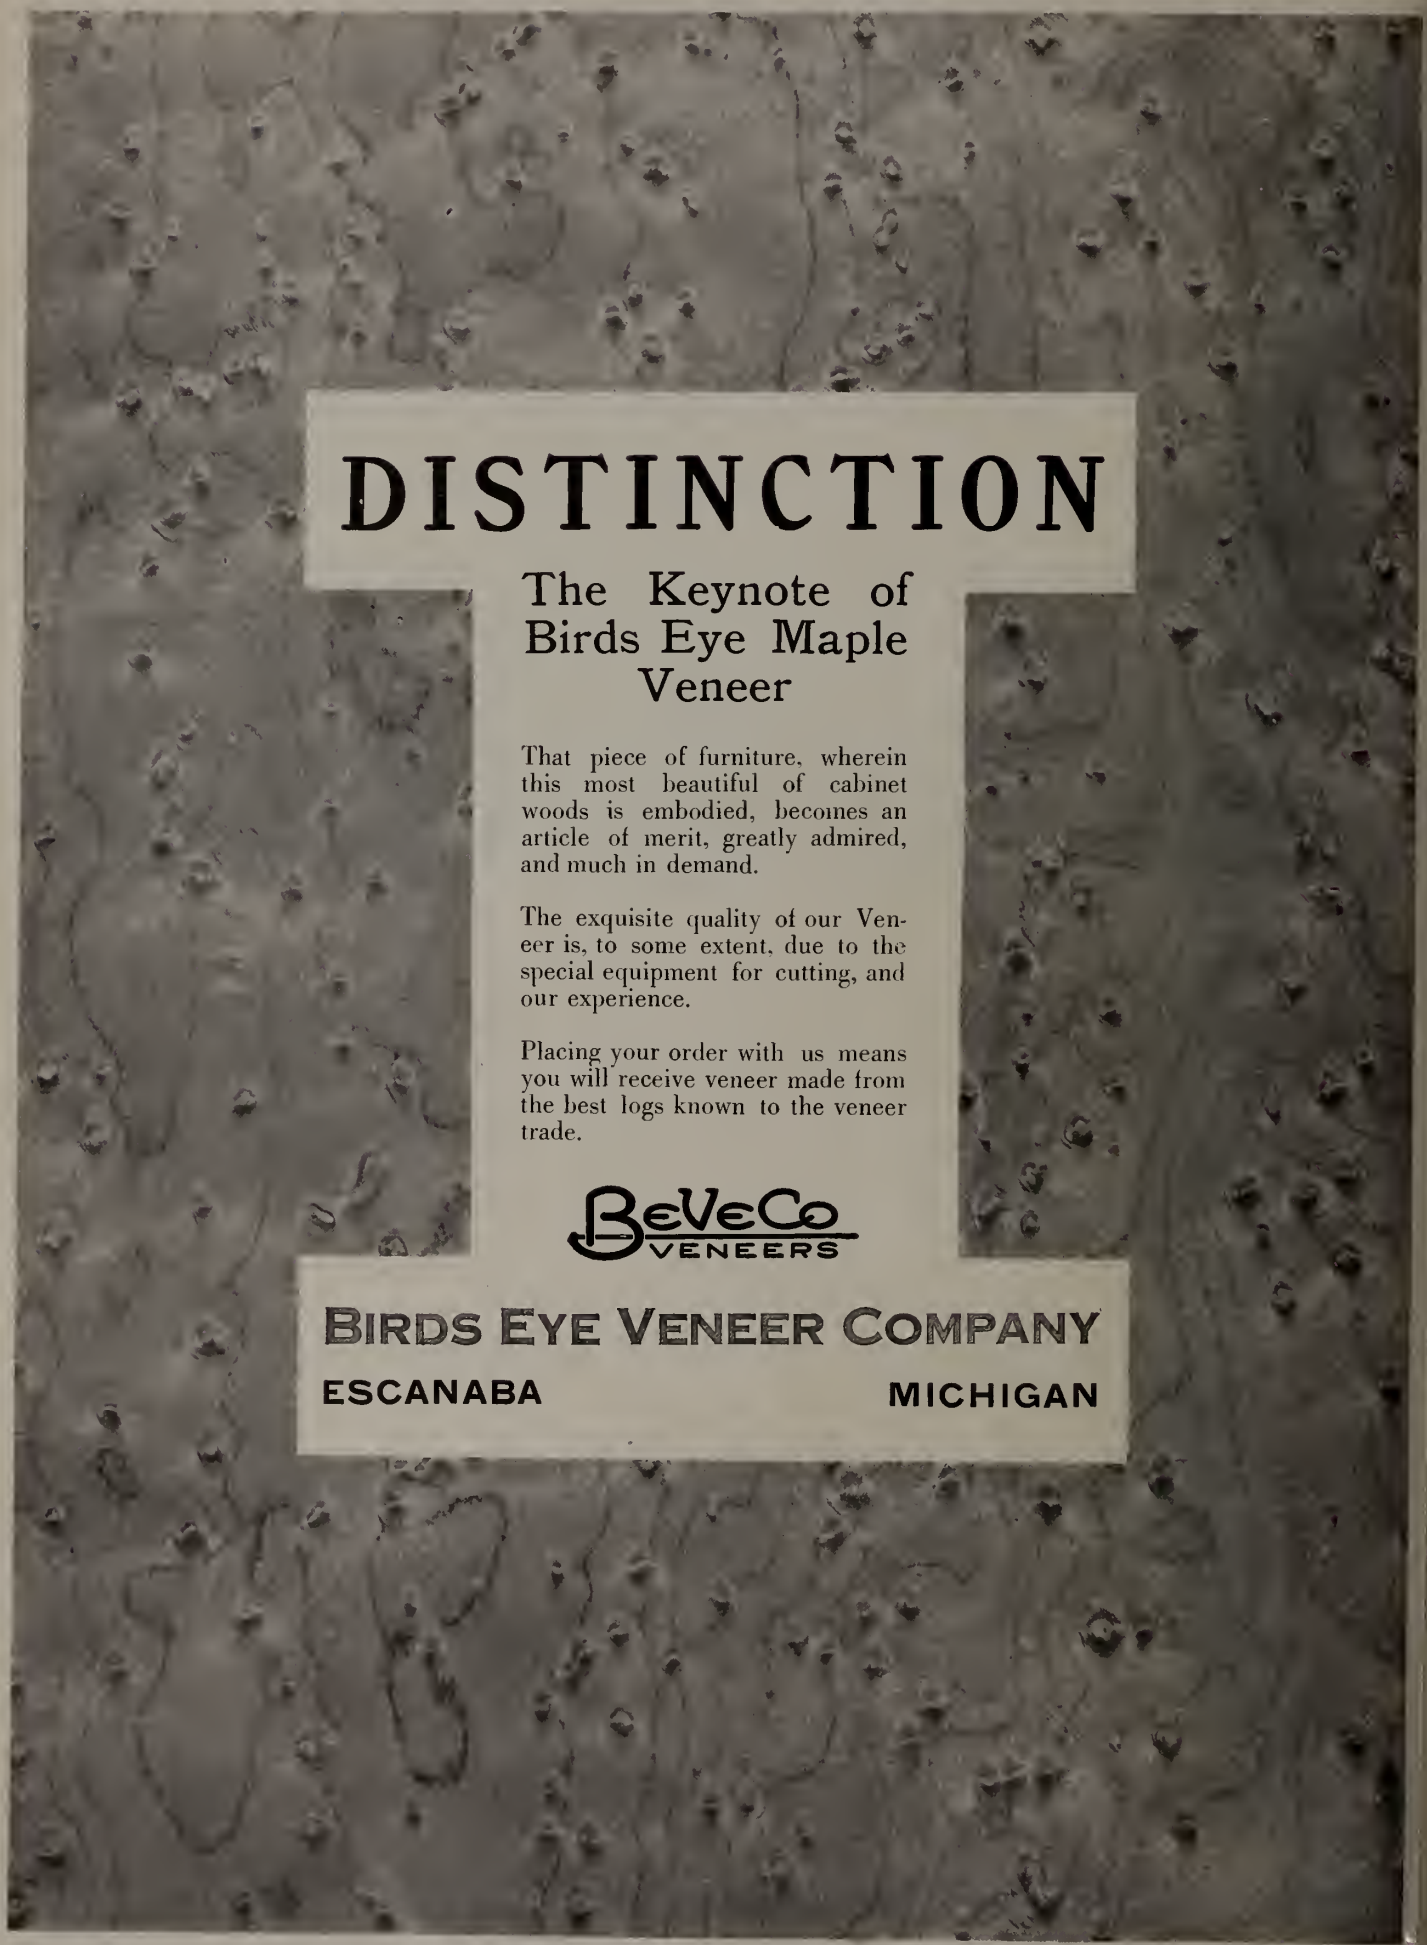
4—It will enable you to make more prompt deliveries.

We will analyze your particular conditions and then make you a proposition on an equipment that we know, from our extended experience, will save you time and money, as well as improve your product.

We guarantee fully the efficiency of the equipment as well as its mechanical construction. Every installation has been successful. There are hundreds of concerns to whom we can refer you.

A. S. NICHOLS COMPANY, 33 West 42nd St., NEW YORK CITY

Manufacturers of Dryers for Lumber, Veneers, Glued Stock, Varnish, Paint and Enamels, for both high and low temperature work. Also sole agents for "Zenitherm" insulating material for the making of rooms for both high and low temperature drying.



DISTINCTION
The Keynote of Birds Eye Maple Veneer
That piece of furniture, wherein this most beautiful of cabinet woods is embodied, becomes an article of merit, greatly admired, and much in demand.
The exquisite quality of our Veneer is, to some extent, due to the special equipment for cutting, and our experience.
Placing your order with us means you will receive veneer made from the best logs known to the veneer trade.

Veneers and Panels

Is Your Glue Room Systematized?

Uniformity of Operation Specially Adapted to Economical System—Lift Truck Employed to Advantage—Marked Effect on Production

By Veneer Foreman

There is probably no department in a woodworking plant into which efficient handling methods can be so readily introduced as the veneer department. This is due partly to the fact that there is a certain uniformity to the product and also that the sequence of operations is the same in nearly every instance. That being so, it is a wonder that the average glue room is not conducted on a more efficient basis.

In the ordinary factory veneering, cured and irregular surfaces is the exception rather than the rule, so that this phase of the work need not be given too much consideration, from the point of view of reduced handling costs. In piano factories and other plants where the veneering of curved pieces constitutes a considerable part of the work going through, one finds special forms and presses that facilitate this work. Here production is not such a big factor, although the same ideas are applicable. If panels, case fronts, tops or similar plain surfaces comprise the bulk of the output of a veneer room, there is plenty of scope for systematizing the work so that greater production and lower costs will result.

How System Is Worked Out

Uniformity of product means that uniform methods of handling can be adopted and a regular system installed. Probably the best method of moving veneers and panels in both large and small plants is with the aid of suitable platforms and an elevating or lift truck. As these platforms do not take up much room when empty, for they can be stacked, and are not very costly, a sufficient number may always be kept on hand to take care of all the requirements of the department. This means that all rehandling may be eliminated, thus effecting a saving right at the start. If the work goes through in small lots, the platforms may be built such a height that all stooping is done away with. In any case, it is a good idea to provide a few high platforms to take care of the small lots.

As the veneers crossbanding and, in some instances, the covers, are got out and rough sized, the pieces are marked and piled on a conveniently placed platform, which when filled may be moved to the next machine and placed convenient to the operator or may be run to some allotted parking or storage area where it stands until required. As each succeeding operation, such as jointing, taping, etc., is performed, the pieces are always piled on the ever-handy platform. As the moving of a loaded platform from one operation to the succeeding one consumes but a few seconds, the work may be said to be laid down by one operator and picked up by the next man with a minimum of lost motion.

To permit of the free movement of loaded trucks from one operation to another it is absolutely essention that provision be made for keeping the aisles clear and unobstructed at all times. This means that suitable storage space, conveniently located, must be provided. Some manufacturers mark off the aisles and passage-ways by heavy white lines, painted on the floor, and make it imperative that no obstruction be permitted to remain between the white marks.

Someone may think that this is carrying the movement and handling of work to a ridiculous extreme. Unless some simple systsem is worked out and followed, it is almost impossible to avoid a certain amount of delay and needless movement and shuffling of trucks.

As the veneer room is a highly specialized department, the equipment may be placed to the very best advantage, for practically all the work handled. This feature should be considered. It is possible to arrange the various pieces so that the work moves from saw to jointer, taping machine, redrier, glue spreader, etc., in a direct line, without any confusion on recrossing, thus taking full advantage of all the benefits of straight-line production.

Increase Production Results

When this is done, it is usually found that more work is put through as to a certain extent, each workman makes an attempt to prevent the material from piling up behind him and unconsciously works a little faster. Another feature is that where the work is conducted in an orderly, systematic manner, it has a subtle, far-reaching effect on the workmen, resulting in greater care being taken, increased efficiency and a better product.

The platform truck, owing to its extreme mobility and ease of handling, seems to be particularly adapted to the peculiar problems of the veneer department.

Reasons For Glue Failures

Glues are often blamed for failures for which they are not responsible. Tests made at the Forest Products Laboratory of the U.S. Forest Service at Madison, Wisconsin, show that properly handled commercial glue develops a shearing strength greater than that of most woods.

The average glue user prepares his glue with reasonable intelligence but commits atrocities in preparing surfaces to be glued and in handling pieces after gluing. To get full strength from any glue, proper surface contact is imperative. Good glue will adhere fairly well even with poor surface contact. Joints of this kind possess, however, inherent weakness and the added disadvantage that they are more liable to ruin through bacterial action than tight joints, since the glue in them is more exposed.

The proper application of pressure is important in all glued work but doubly so in the manufacture of plywood. Securing proper pressure involves keeping cauls and press in first-class condition and using them

skilfully. With the hydraulic press it is easy for careless or ignorant workmen to spoil a batch of stock by applying too much pressure and starving the joint.

Plywood failure may often be traced to unevenly surfaced cores. Planer work should be watched carefully and calipered frequently. A low spot in a batch of cores will mean that insufficient pressure will be obtained in that place and loose plywood or blisters may result.

Taking chances in storing and shipping glued products causes many failures. Work is frequently improperly dried and is then expected to hold together in damp rooms. Glue attains its full strength only when it is thoroughly dried. This necessitates removing the moisture absorbed from the glue by the wood. Glued work should be placed where there is a chance for good air circulation. After drying, average shop conditions should not cause failure.

New Phase in Selecting and Matching Veneers

Dignity and Strength Rather Than Striking Effect — Advantages of Veneered Work Should be Emphasized—Suggestions for Selecting Stock—Textures Which Should be Avoided

By Albert Hudson

It is gradually being recognized that the veneer room is a scientific department. When we look back into years gone by and think over the way that veneering was done, we wonder how it was possible to turn out a satisfactory product and at a profit. Yet, if we examine any high-class antique furniture, we find that the principal parts, calling for figure and striking effect, are all veneered.

In modern veneering practice we find the dominating note in the use of veneers is one of dignity and strength rather than striking effect. There is evidence of more thoughtful matching of veneers, more careful laying and a general refinement in the use of figure. All of which indicates that an artistic sense is developing, as it should, and that the cabinet work of to-day is worth more than that of bygone years

Eary Beginning of Veneer Industry

The veneering industry is only a little over 100 years old. There is evidence, however, that some veneering was done previous to that. This was the forerunner of the present segment veneer saw, and closely resembled it in general appearance. In his workshop in Battersea he took the circular saw as it was then known and developed the concave saw mounted on disks for cutting veneers. He operated two veneer saws 18 feet in diameter, and two that were 9 feet. These saws were used for cutting veneers from rosewood and mahogany, as thin as one sixteenth of an inch, with great precision. At that time this was considered a wonderful feat. Great improvements have been made since those days.

To-day we see veneer all around us in a great many forms. It makes the very best furniture, phonographs, interior panelling and is even to be found in packing cases. Some few years ago the term veneered furniture was looked upon by the average purchaser as a synonym for cheap furniture, and even to-day there is a prejudice against veneered stock. There is no doubt that this prejudice attached to the term "veneer"is due to the fact that articles have been veneered and sold that did not give satisfactory service. when the purchaser wanted something durable he sidestepped what he called "that veneered stuff," and looked for something solid. It is not a matter of changing the name, however, for if the distinctive qualities, which made it objectionable were to remain, it would, of course, soon be found out and the new name would only add more to its prejudice.

Much progress has been made in veneering and in the veneer department of late years. One can now buy a veneered product with reasonable assurance that it will stand any test. It should be profitable for manufacturers of veneered lines to advertise such facts, stating the why and the wherefore of veneers, assuring all purchasers that it is the highest development of the woodworker's art, and emphasizing the fact that any article, carefully veneered, will give longer service than if made solid.

For beauty, quality and usefulness, built-up stock cannot be excelled. Three or five-ply material, each ply laid with the grain at right angles to the next layer, forms a strong piece of laminated stock, which if made properly, will not warp, twist or split. Apart from furniture and phonographs, built-up stock can be used for interior trim, columns for the verandah; in fact the possibilities of such products are unlimited. It must be noted, however, for such work as the columns of verandah, artistic store fronts and all such classes of work, waterproof glue must be used.

Care in Selection of Stock

In the selection of face veneers, great care should be taken because there are many well-figured veneers that are unfit for high-grade products for two reasons:

1. A soft, spongy texture has a tendency to take up too much color in the staining and always flat under the finish.
2. Because of the natural interchange of smooth, hard and soft streaks, the result being the veneer will show light and dark streaks after staining, and needs toning in the finishing room.

This alone shows that all veneers should be selected according to color and texture. The most artistic results are obtained from veneer of good even figures and texture. Then again, there is what is called "the unsafe veneer." With this veneer, however careful a man may be, the glue penetrates to the outer surface and trouble follows in the finishing room.

New Industrial City Will Spring Up

A new city, whose name, Saguenay City, is already incorporated, is to be built, beginning next spring, near Kenogami, Lake St. John county, by the Price Brothers & Co. This firm intends to establish there a very large pulp and paper plant. The contractors say they will need at least 4,000 men next spring.

View in Toronto warehouse of Panels, Limited.

Panel Industry in Canada Developing

Well Equipped Plant at Southampton, Ont.—Efficient, Up-to-Date Installation—Outline of Methods Followed

A Canadian panel manufacturing organization that has enjoyed a satisfactory growth is that of Panels, Limited, Southampton and Toronto, Ont. This company was organized less than two years ago to manufacture panels and various forms of plywood for the Canadian trade. A plant was installed in Toronto where it was quickly found that the capacity was far too limited to take care of the volume of business offering. A larger building was secured in Southampton, Ont., and the equipment from Toronto, together with some new machines, installed there. The head office, however, remained in Toronto.

The Southampton operation is housed in a two-storey, rough cast concrete factory, with a floor space of 20,000 feet. The equipment, which is modern and up-to-date, is driven by a 50 h.p. steam engine. A partial list of machines in operation is as follows: Black Bros. taping machine, Jenkins-Falls veneer jointer, Capital veneer clipper, Francis hydraulic press, 30"x 60", and Perkins glue mixer and spreader. In addition, the following woodworking machines have been set up for core and general work: Jackson-Cochrane revolving clamp, Herzog self-feed jointer, American band saw, swing cut-off, single surfacer, American straight-edging and ripping saw, belt sander, double cut-off, and two and three drum sanders.

Cores Given Careful Attention

The straight cut cores are made from chestnut or basswood. About 100,000 feet of this material is usually carried in stock. A 4 compartment Sidman kiln was installed to dry the core stock. This material is roughed to length and then jointed on the American straight edging saw. The pieces are glued without any further correcting. The glueing is all done on the Jackson revolving clamp.

After the cores are removed from the clamp, they are straightened on the Herzog automatic jointer and then sized in the planer. Before the crossbanding is laid, they are run through the drum sander. This results in a core uniform in thickness as well as providing a good glueing surface.

The three-ply and small five-ply panels are laid in one operation. Two operations are performed in laying the larger fine ply pieces and the seven-ply stock. That means that the three-ply cores are glued up first, and, after drying, are surfaced in the drum sander. It is important that the cores be evenly sized to prevent the face veneers being cut through in the final sanding.

Special Drying Room

The glueing and press work is carried on in the usual manner. Three-ply cauls are used on all panels. These are kept clean and treated with lard oil so that the work will not adhere to the cauls. Retaining clamps are used and the built-up stock allowed to stand 24 hours under pressure.

The drying room was constructed to their own specifications, in which the heating coils are placed along the side walls near the bottom. As the forms are taken down each morning the panels are immediately piled between strips on sleighs and allowed to stand until the afternoon when they are moved, with the aid of a lift truck into the drying room. The temperature in this room, which is above the engine room, is controled by a Tag self operating temperature controller and is held at from 110 degrees to 115 degrees with 35% relative humidity. The temperature is registered by a hygrometer. Fresh air is drawn in from the outside by means of a wooden flue along the floor, from which it is conducted vertically by wooden

flues placed at intervals. The air is allowed to escape from these on a level slightly higher than the sleigh or platform loads of panels. The heavier moisture charged air is drawn off at the floor level, opposite the fresh air duct by means of a wooden flue connected to the dust collector system.

Standard Drying Times Used

It has been found by experience, and as the result of careful tests, that the surplus moisture in three-ply panels as thick as ¼" is removed in 24 hours, while 48 hours is required to dry all five-ply stock. This time is ample because the stock is all redried before glueing. One advantage of a veneer drying room in which the temperature and humidity are kept constand is that definite drying times can be established, and when once adopted, very few tests for moisture are necessary.

Circulation, however, is of the utmost importance, for unless an adequate movement of air is maintained, the piles or truck loads of panels will not dry evenly, with the result that some of the pieces in the centre of the piles will contain too much moisture and perhaps cause trouble at a later date. Thus it will be seen that the movement of air must be positive enough to carry the moisture from the centre as well as the surface panels. When the direction air movement is ascertained, the piles should be so placed that the stickers do not retard the flow of warm air. After being dried, the panels are sized on the double cut-off and finished on the drum and belt sanders.

Home-made Redrier

The redrier, which was built to their own design, consists of a series of metal platens placed in heavy corner posts, in a horizontal position and heated with live steam. On each side of the hot platens are wooden platens which are opened and closed as required by means of eccentrics placed on shafting and controlled by means of levers. Each set is independent of any other set, therefore as soon as veneer is placed pressure can be applied and the next set emptied and refilled. There is no time lost as the veneer in the first set of platens is ready to come out by the time the last set is filled. The veneer comes out dry and flat and without checks, as the pressure is regulated.

About 3,000 feet of panels are turned out each day. This output is made up of stock in Mahogany, walnut,

plain and quartered oak, plain and quartered gum, birch, etc., for phonograph and furniture factories, and sash, door and general woodworkers.

The personnel of Panels, Limited, Toronto, is as follows: J. A. Houde, president; H. T. Brewitt, treasurer; W. A. Dugit, secretary, and R. C. Stock, superintendent in charge of the Southampton plant.

Box Manufacturers Form Section

Arising out of the work of the Tariff Commission the Canadian Manufacturers' Association decided to perfect their organization by the formation of sections of members belonging to various trades and industries. The Montreal branch, on January 10th, formed the Wooden Box Manufacturers' Section, this being decided at a meeting held at the Board of Trade, Montreal. The object of these sections is to secure interchange of opinion among the members and coordinate action in reference to such questions as the tariff.

Mr. N. P. Martin, of Martin Freres, was unanimously elected chairman, with Mr. Stewart F. Rutherford as vice-chairman. Others present at the inaugural meeting were: C. N. Dickson, Dominion Box & Package Co.; J. W. Thomas, Meyer-Thomas Co., Ltd.; J. N. G. Torrier, Hogue, Ltd.; R. A. Atken, G. & J. Esplin, Ltd.; Chas. Booth, Martin Freres; T. J. Pariseau, Pariseau, Ltd. A vote of thanks was passed to Mr. Rutherford for his work in preparing a brief for presentation to the Tariff Commission, and arrangements were made for regular meetings of the section.

Grinding Wheels for Saw Sharpeners

If the best results in the re-sharpening of the various types of saws by machine are to be secured it is highly important that wheels of suitable grade, grit and thickness be used. In a general way, wheels require to be on the soft side, so as not to overheat the saw tooth; and in order to impart a fine cutting edge, only a light cut should be taken over the tooth profile. The thickness of the wheels should, as a rule, not exceed one-third of the pitch of the tooth being ground. When ordering grinding wheels it should explicitly be stated for what kind of saws they are required, the width and number of teeth per inch, and whether the saws are tempered hard or soft.

New Field for Panels and Plywood

Why Not Built-up Panels of Standard Sizes to Compete With Wallboards? —Advantages of Built-up Stock for Walls—Opens Up Large Market With Untold Possibilisies

By H. W. Marsh*

"There are some fields for the sale of medium grade, three-ply panels, in 3/16 and ¼ inch thicknesses, which have been neglected by panel manufacturers, probably because the proposition seemed too large to be successfully handled by any one house; but I believe that a combination of manufacturers could easily arrange for the sale of such stock and create a market that would afford long runs of strictly standard material, which could be profitably used as fill-ins when regular orders were slack, and the wheels kept turning during what would otherwise be dull times. Also an outlet would be afforded for millions of feet of veneers and much raw material could be worked in that now goes to waste.

"The proposed line would consist of laminated panels in standard sizes and thicknesses, sold at standard prices, which would compete successfully with the various brands of wallboards now being so extensively used. The small difference in cost between the wall-board and veneered wooden panels would be immaterial with the average ultimate consumer, once his attention was called to the superiority of the veneered goods in appearance, durability and upkeep.

Introduction of Fir Panels

"The Wheeler-Osgood Company, of Tacoma, Wash., is marketing a line of fir panels with success, which goes to prove the practicability of the plan I suggest. This company has issued a little booklet showing the advantages of fir panels for interior trim and how easily and cheaply they may be applied. Prices are quoted on thirteen widths and six lengths (a variety covering practically all needs). These fir panels are being used very generally in the bungalow type of houses in vogue in that section and that they are as standard there, 'as 1-inch oak is here.' This market is being rapidly extended. I see advertisements of 'wood' fir panels by Chicago and St. Louis houses and understand that they are gaining quite a foothold in the east. Fir is not the only handsome wood in the world and why shouldn't central and eastern panel manufacturers have some of this business?

"The initial difference in cost would be the only difference in the expense of using veneered panels and wallboard; it would cost practically the same for installation and finish, and the finish on the wood would improve with time, while that of the wallboard would deteriorate. The wood panels are vastly superior in appearance and there are few ultimate consumers who would not prefer a real wood finish when it could be secured at small extra expense.

Possibilities of the Demand

"In talking this matter over with a practical architect, he thought the plan was full of possibilities and cited some of the modern apartment houses, where it was desired to give as classy a finish as possible with the least expense. He suggested that, with the number of this class of buildings being erected, they alone would afford a considerable market.

"Thousands of stores all over the country have occasion to erect partitions that are more or less permanent. If you want a demonstration, just step into any of the piano, phonograph departments or clothing stores. By the time these partitions are properly decorated, if they are made of wallboard their cost is likely to exceed that of veneered panels and they require frequent redecorating, whereas the laminated panel would only need a rubbing over.

"The street car company in Indianapolis recently purchased several new cars, the vestibules of which were lined with wallboard. The cars have been in service only a few weeks, yet several of them have holes kicked through the wallboard. We all know that while veneered panels might be badly scratched up by a careless motorman's foot, it would require considerably more kick than the average motorman possesses to make a hole through a three-ply veneered panel. With anything having the initial cost of a street car, the extra expense of using the veneered panel would have been immaterial. Why was wallboard used? Wasn't somebody asleep at the switch? There are a thousand other uses for stock veneered panels; it is only necessary to make them easy to get and show how easily they may be installed to establish a tremendous market.

How Trade Could Be Handled

"It would probably be best for a combination of panel manufacturers to establish a central office where plans and publicity could be taken care of. Specifications and prices would have to be established and enough standard stock manufactured to insure the quick filling of orders. At first it is likely that orders as received would be apportioned to the mills and shipped from their warehouses, but if the proposition were properly pushed it would be only a short time until builders' supply houses and mail order houses would be carrying stocks of the veneered panels, just as they are now carrying the wallboards.

"Wallboard advertising has been both extensive and intensive. You can scarcely pick up a popular magazine without having the advantages of wallboard placed before you. Here is a builders' journal that carries three full page advertisements for three different brands of wallboard. The introductory work has been done; the public has been educated up to the inexpensive, quickly-applied wall covering or partition, and it is only necessary to show the vast superiority of the veneered panel to create a strong demand for it.

We are short a million homes already and the shortage is becoming more acute every day. Some of these days building will take a spurt, in spite of what material and labor may cost and 'quick delivery' will be the watchword with dwellings. Readily accessible stocks of veneered panels for interior finish that can be quickly and cheaply installed by any carpenter, or any man with a little mechanical ability, will be in big demand if they are where the people can get them. Isn't the matter worthy of serious consideration?

*Editor, "Veneers," Indianapolis. Address before Veneer and Panel Manufacturers' Association, Chicago, Ill.

Lumber Log Yard Showing Large Travelling Derrick

A Perfect Organization

A man is most skilled in that part in which he has been trained. So in manufacturing our hardwood lumber and veneers we first select the precise character of logs which will make the best finished product, and then divert each class of logs to a mill designed for a specific purpose.

We have four band mills and three veneer mills manufacturing the highest obtainable in quartered and plain white oak lumber, sawed quartered oak veneers, walnut lumber and sliced, rotary cut walnut veneers, rotary cut yellow poplar crossbanding, and a general line of high-grade southern hardwoods. This product is supplied by a service complete in all its details.

WOOD-MOSAIC COMPANY, Inc.
LOUISVILLE, KENTUCKY

General View of Sawmill, Dry Kilns and Lumber Yards, Louisville Plant

Publicity To Be Given Veneers and Plywood

At the annual meeting of the National Veneer and Panel Manufacturers' Association held recently, in Chicago, two very important projects were discussed and favorably acted upon. The first was that the Association undertake trade extention work through collective advertising. The second that the Association undertake to provide for official inspection of veneer and panel, and thereby afford a means of settling disputes between manufacturer and buyer, Both of these projects, and particularly the collective advertising plan, were enthusiastically received and unanimously approved by all present at the meeting.

Many large industries have undertaken trade extension work, which means advertising. The unquestioned intrinsic merit of plywood and veneer will make advertising in our line particularly effective. It is also true that the great majority of people are utterly ignorant of veneer and plywood and their advantages. The average person is under the impression that solid furniture, for instance, is the best furniture. Whereas, the well informed person knows that veneered furniture is stronger, more durable, and more beautiful and that the best furniture is now being made of plywood. Veneer and plywoods up to the time of the war were looked upon largely as decorative agencies. The war and subsequent research work, have demonstrated the value of plywood as a structural material.

Up to the present moment the advantages of veneer and plywood have never been advertised. The industry, like Topsy, has "just growed." Intelligent advertising will increase the demand for plywood immensely and intelligent advertising will increase the demand for plywood which have heretofore escaped notice. Such trade extension work cannot be undertaken by the individual, it must be collective. The National Veneer and Panel Manufacturers' Association affords the means of bringing about co-operation along this line, and it is up to you, and every other veneer and panel manufacturer, to get behind the proposition and push for all you are worth.

Necessarily, plywood must take the predominant place in all advertising, because plywood is the finished product which must be sold, but every foot of plywood for which a new market is found means a new market for from three to five feet of veneer. Therefore, the plan is to bring into this work, not only plywood manufacturers, but veneer manufacturers, glue manufacturers, abrasive manufacturers, machinery manufacturers, and everyone whose business will be helped by an increased demand for plywood.

As a result of the action taken at the Chicago meeting, a committee was appointed with power to go ahead and finance and put through both propositions. This Committee got together before leaving Chicago and preliminary plans were made and the Committee was organized as follows: J. T. Horne, General Chairman, H. S. Young, General Secretary, E. V. Knight, Chairman Finance, G. O. Worland, Chairman Trade Extension, C. B. Allen, Chairman Inspection, E. E. Hemingway.

The following gentlemen were unanimously chosen to serve as officials during the ensuing year: President, J. T. Horne, J. T. Horne Veneer Co., Tuscaloosa, Ala. First vice-president, N. M. Willson, Pearl City Veneer Co., Jamestown, N. Y. Second vice president, O. C. Lemke, Underwood Veneer Co., Wausau, Wis. Third vice president, H. J. Barnard, Central Veneer Co., Indianapolis, Ind., treasurer, E. H. Defebaugh, Chicago, Secretary, Howard S. Young, Indianapolis, Ind.

Removing Stains From Veneered Work

Manufacturers of veneered products find that certain of the waterproof glues on the market show a tendency to stain through the thin face veneer. The thinner the face stock, the more noticeable this tendency. With veneer thicker than 1/28 in., this trouble is seldom experienced. With 1/28 in. stock, if the glue is spread thinly and the stock removed from the press or retaining clamps in about 2½ hours from the time the glue was applied, it will be found that the tendency to stain has largely been overcome.

This staining is due to the lime contained in these glues. The manufacturers of waterproof casein glues are striving to overcome this objectionable feature. In an experimental way they have been successful. This difficulty will, probably, be eliminated in the glues of the near future.

Stains of this kind may be removed, or rendered inconspicuous, by an application of a 10 or 15 per cent. solution of oxalic acid. The same applies to joint work. By sanding the joint and then applying the above solution, then sanding lightly, the glue or joint lime will be rendered invisible.—J. C. H.

A proper band-saw guide tends to save the saws from crystallizing and breaking.

The emery wheel may be used to make a pretty color scheme on the back of a knife, but it does not improve the temper.

The temper in different band-saw blades varies. This should be considered when putting in tension.

Large stocks always on hand for prompt shipment.

We carry in stock for immediate shipment 3 and 5 ply panels in Birch, Oak and Mahogany.

Sizes 24 and 30 inches wide; 48, 60 and 70 inches long.

Let us quote on your panel requirements.

Can Present Lumber Values Last Indefinitely?

Are Woodworkers Overlooking Good Bet?—Lumber Production Away Down and Stocks Dwindling—Stabilization Benefit to All

By L. R. Wright

Have you placed orders covering your lumber requirements for the next six months? I want to repeat the suggestion made in the December "Canadian Woodworker" that now is the opportune time to cover your requirements. The manufacturer, who buys lumber at current values, cannot sustain a loss. Prices cannot go lower, they have reached rock bottom. The next movement will be upward and it is likely that quotations will show some such reaction in the near future.

Lumber, to-day, can be purchased below cost of production, in many instances below its intrinsic value. Such a condition cannot last indefinitely. Some lines are selling as much as 30 and 35 per cent. below replacement costs. It may be suggested that production costs are too high. They are, and are bound to come down. Greatly increased efficiency on the part of labor in the woods and mills and a lowering of the prevailing wage scales, will not bring costs down to where lumber can be sold, profitably, at present rates. The lumber manufacturer must show a profit on his operations and as soon as the demand strengthens, will find it imperative to increase prices to cover operating expenses. **Conditions so favorable to lumber buyers, cannot last indefinitely.**

The lumber manufacturer, to protect himself and his interests, has been forced to close down. Thus we find that fully 75 per cent. of the lumber operators in the United States have stopped cutting for indefinite periods. Many have withdrawn their equipment from the woods and stopped the input of logs. A careful survey of the situation in the different producing centres was made, recently, by an authority, and his estimate was that the amount of lumber being cut is 13 per cent. of normal in the southern areas producing oak, walnut, gum, etc., and 16 per cent. of normal in the northern centres cutting birch, beech, maple, etc. These figures cannot help but give food for thought, especially when coupled with the facts that stocks on hand are well below the quantities normally held at this season of the year, and the small stocks available are being gradually reduced by small orders.

The general attitude of those lumber manufacturers who have ceased operations, is that they will keep their plants idle until some improvement is shown, sufficient to enable them to produce at a profit. As production costs have dropped and are likely to go still lower, it is anticipated that a comparative low level of values will prevail, provided there is not a rush to cover on the part of a large number of lumber users. Such a feature would undoubtedly result in a sharp rise in prices and a scramble for stock.

Should an "Auction" market prevail this spring, and many think it will, the woodworker, who stayed out of the market, will have only himself to blame when he finds he is forced to pay a stiff price for the material he needs. Apart from the fact that any who buy now will save money, if all woodworkers who find their lumber stocks running low, were to enter the market it would tend to stimulate the production of lumber, assist in stabilizing lumber values and react favorably on their own industry.

Conditions in both Canadian and American markets have not shown very much improvement. A few sorting-up orders are being placed but buying is not general. The one bright feature is that more enquiries for stock and prices are being made and that these have every appearance of being bona fide, that is, sent in by woodworkers who are desirous of buying. It is anticipated that the next month will see a resumption of buying on a gradually increasing scale.

Large Lumber Manufacturer Closes Plants

The W. M. Ritter Lumber Co., Columbus, Ohio, one of the largest, if not the largest, lumbering manufacturing company in the United States, have closed down all their saw and planing mills for an indefinite period. In this connection they have this to say. "While our stocks on hand are only approximately normal and while we are aware of the belief on the part of a very large number of business people that there will be a steadily improved demand for hardwood lumber after the first of the year and the belief on the part of some that one need not be surprised to see, in the future more or less distant, a renewal of auction market conditions, which was in evidence last year and which the present policy of buyers invites or certainly tends to produce, we think the present situation in respect to the cost of production and sales prices is such that it is the part of wisdom to suspend production until the market sufficiently improves to justify resumption."

Large Commercial Forests in Brazil

One of the world's greatest needs at the present time is timber of almost every description. In view of this fact the lumber resources of Brazil are of considerable interest, especially as many varieties of hardwoods, used in the manufacture of furniture of the better grades and for hardwood floors, doors and other joinery work, are available in great quantities. On the numerous plateaux of the southern states extensive pine forests exist, and large quantities of logs and planking are being sent from these forests to the Argentine and Uurguay. The development of the lumber industry of Brazil will depend largely on improvement of the railway and inland waterway transportation facilities of the country. It is estimated that the forests of Brazil are sufficient to supply the needs of the world for several centuries. There are localities in the states of Bahia, Espirito Santo, Santa Catherina, Parana, Rio de Janeiro and Sao Paulo, where the felling of trees has been going on for some time, and large quantities of hardwoods have been shipped to America and Europe; but the time has undoubtedly come when this trade should be increased, especially in view of the constantly increasing demands for lumber, both in the United States, Canada and in Europe.

It often happens that a small outlay of a few dollars will save hundreds in the course of a year.

Big Demand for Fir Furniture in B.C.

"Western Products for Western People" is the motto of Mr. T. E. Dowling, head of the Dowling Manufacturing Co., Vancouver, B.C., who is specializing in the manufacturing of bedroom and kitchen furniture of British Columbia fir. Mr. Dowling, who spent seven years with the David Spencer Co. as manager of their furniture department, realized the great future possibilities in this local wood, and after some years of experimentation and endeavor has succeeded in producing medium-priced fir furniture with a finish considered impossible a few years ago.

The products of this company are, as yet, known only to the local market, but with the price of hardwood furniture resting on high levels, there is no reason why articles of B. C. fir should not gain favor with the whole of this country. When fir furniture first came on the market no serious effort was made to produce a fine finish and on account of the surface roughness and lack of care in manufacturing it was not considered favorably by the general public. The Dowling Manufacturing Co. have, however, overcome that prejudice by the truly wonderful results they have obtained with their fumed and golden oak finishes. They specialize in bedroom furniture and the fumed finish is in great demand for this class of furnishings.

Fir is liable to quite an amount of shrinkage and swelling, as anyone who has tried to open a swollen dresser can testify, but that disadvantage is overcome by the Dowling Co. by means of overlapping edges which not only provide for the peculiarities of the wood but make a dust-proof seal. Bevelled plate mirror glass is used for the dressing tables and chiffoniers and simplicity of design and sturdiness of construction mark their manufacture throughout. Wonderful effects in graining are obtained by exceptional care in matching the wood and especially in the golden oak finish is this care evident.

A Beloit No. 1 cut-off saw, a Hallman Penniston joiner, a Crescent pony planer, and a combination saw and shaper are included in the equipment of this factory. Plans for further extension of the building and machinery are now under way. The field for sturdy, artistic, medium-priced furniture is practically unlimited and as recent methods in producing fir furniture have shown what excellent results can be obtained from this wood, the production and use of British Columbia fir should show great expansion.

Large Handle Manufacturing Concern

One of the largest hickory handle manufacturing organizations is described in a well-known publication as follows:

The Turner, Day & Woolworth Handle Company, is successor to the Turner & Day Company, which was organized in 1854 and began the manufacture of handles in Norwich, Conn. The main factory and offices are now located in Louisville, but there are other large factories at Memphis, Cairo, Nashville, Poteau, Okla., and Paragould, Ark. In addition to these large factories there are about twenty-five smaller factories located in Kentucky, Tennessee, Mississippi, Texas, Arkansas and Illinois. It has been the endeavor of this company to locate these small factories in the best hickory timber sections of the several states mentioned.

The Turner, Day & Woolworth Handle Company manufacture all varieties of hickory handles for hatchet and hammer manufacturers, edged tool manufacturers, and railroad, coal and other mining companies. Some idea of its extensive business is conveyed by the fact that the company manufactures over 2,000 different kinds of handles. Over one-third of the total products of this concern are shipped to Europe, Asia, South America and other foreign countries. The trade mark —"We Handle the World"—is peculiarly appropriate and well chosen. Over 40 per cent. of all the hickory handles used in the world are manufactured by the Turner, Day & Woolworth Handle Company. There are at present over 1,500 men employed by this organization and its annual payroll runs well over $750,000.

Melted Wood! What Next?

It is possible to melt wood by heating it in a vacuum, producing a hard, homogeneous substance. Melted wood was for a long time only a laboratory curiosity, but it may be that industry shall presently discover practical applications of the greatest interest.

Now although wood is eminently inflammable it melts at a relatively low temperature, but in very precise conditions, and only when it is absolutely removed from contact with oxygen so that its combustion is impossible. This may be understood when we remember what its composition is. When its immediately soluble constituents have been removed, by means of alcohol, for instance, it gives on analysis organic acids, water, oily essences, silcates, sulphates, phosphates, chlorides, and hydrocarbonates of lime, potash, soda and magnesia, carbonic acid, carbonated hydrogen, etc.—that is to say, solely bodies susceptible of being evaporated or dissolved after having co-operated by chemical affinity in the formation of determinate substances.

Starting from these data Messrs. Bizouard and Lenoir, in 1891, studied the problem of the fusion of wood. They operated in a closed vessel at a relatively low temperature—that is about all one can gather from the records of the period.

Their work was taken up by others, and now there is a full operative technic that enables us easily to obtain excellent results. A metal receiver, a sort of boiler having a double bottom through which superheated steam passes, is filled with bits of wood. It is closed by a lid similar to that used in autoclaves and provided with an apparatus for exhausting the air. When the wood thus kept in a vacuum is heated above 284 degrees Fahrenheit the water and other volatile substances are given off first and are drawn off by means of the exhausting apparatus, after which the heating is continued for about three hours. There then takes place a complex series of fire-actions and phenomena analogous to those that accompany the distillation of wood in a closed vessel, and in this way all the so-called pyrogenous products are separated; these in turn are drawn off, condensed and separated so that they may be utilized commercially. There then remain in the receptacle only the fibrous skeleton of the wood and the mineral salts, which taken altogether constitute a fusible mass. This is allowed to cool slowly, out of contact with the air, and then placed in a second boiler, which, after the air has been exhausted, is filled with nitrogen under a pressure of 1.5 to 2 atmospheres. The whole is heated to 1500 degrees Fahrenheit, for two hours, and at the end of this time the wood is melted into a homogeneous hard mass.

Information and Inquiries

You are cordially invited to make use of this department

Polishing Wax for Handles

East Wentworth, N. S., Dec. 28, 1920.

Editor, "Canadian Woodworker":—

Will you kindly furnish us with a reply to one of these three questions: The address of a manufacturer of wax finishing belts for fine handles, or the address of a manufacturer of suitable dressing for such belts or the formula for making a good wax for polishing handles.

Yours truly,

Maritime Handle Co., Limited.

Many handle manufacturers polish their handles on the glazed or cloth side of the sanding belts after the grit has been worn off. The wax used is a low grade of paraffin wax, which may be secured from any of the oil companies.

Wheels for Tea Wagons

Belleville, Ont., Dec. 27, 1920.

Editor, "Canadian Woodworker".—

Will you kindly inform me where I can secure wheels suitable for tea wagons. Thanking you in anticipation, I am,

Yours truly,

R. McPherson.

The large rubber-tired wheel for tea wagons may be secured from the Gendron Mfg. Co., Limited, Toronto, while the Faultless Caster Co., Evansville, Indiana, makes a suitable line of swivel wheels.

Here's a Poser

St. Anne Des Plaines, P.Q., Jan. 3, 1921.

Editor, "Canadian Woodworker":—

Could you tell how we can eliminate the trouble we have in placing the round iron shoes on a line of children's sleighs we are making? We experience considerable difficulty in this operation. Is there any machine on the market that is adapted for this work.

Sincerely yours,

Le Clerc & Beauchamp, Ltee.

We do not know of any machine built for this purpose. It is more than likely that each sleigh manufacturer has special equipment, which was built to his own specifications. If any readers of the "Canadian Woodworker" can furnish any information on this point their co-operation will be appreciated.

Rocking Chairs Wanted

A large firm of general suppliers in Trinidad, with a furniture department, desire to be put in touch with Canadian manufacturers of rocking chairs. If interested, write in, referring to inquiry No. 2626.

It has been suggested that if the air admitted to a dry kiln were to be taken from some warm place, it would help maintain the temperature in the kiln and conserve fuel.

Doors, Mouldings and Plywood Wanted

A firm of importers of timbers, doors, mouldings, plywood, etc., in Dunedin, N.Z., would like to get into communication with a firm of lumber exporters in Eastern Canada who are in a position to ship from Montreal or St. John. The following are the principal lines required: pine and spruce in planks, select and merchantable quality 12 by 2, 12 by 3, 9 by 2, and 9 by 3; doors and materials for making sashes and mouldings; 3-ply veneer in first and second quality in sheets 72 by 36 and 60 by 36, 1/8 inch and 3/16 inch thick, suitable for dado panelling; single-ply veneer for drawer bottoms. If possible, let the exporter quote for the above lines and state the rate of freight from port of shipment to Dunedin. The name of this firm will be furnished on application. Inquiry No. 2591.

Orange-box Shooks Wanted

The London England, branch of a South African bank has been requested by several of their clients in South Africa to endeavor to make arrangements for the regular supply from Canada of box shooks for orange cases, and invite quotations by cable for 10,000 to 20,000 cases according to the following specifications:

Parts	Length Inches	Width Inches	Thickness Inches
3 inches	11½	11½	1
4 pieces	26	5½	¼
4 pieces	26	5¼	¼
2 cleats	11	1	½

Wood to be the usual quality of pine or other white wood, and the cases to be made up in shooks, bound with wire. Owing to Government regulations, it is necessary that the various pieces are cut to exact size. Quotations to be c.i.f. Cape Town, and date of delivery to be stated. If interested write the publishers of this paper, referring to inquiry No. 2654.

Doors and Dowels Wanted

A manufacturers' agency in London, England, desire to arrange to represent manufacturers of doors and dowels. They ask for sole selling rights in the United Kingdom, and are in touch with importers in the United Kingdom who will give very large orders if satisfactory prices can be arranged. For further information refer to inquiry No. 2790.

Want Furniture for Export

A large firm of travelling agents with headquarters in Trinidad and branch in British Guiana wish to obtain a Canadian connection for low grade furniture, especially cheap furniture and rockers. Refer to inquiry No. 2645.

Many of the special automatic lathes on the market would be found useful for utilizing the wood waste which accumulates in many plants.

While an electric motor will run in a department that is dirty and dusty, it will give better service if installed in a cool, clean place.

There are a great many kinds of different belt fasteners, and each have special advantages for various kinds of belts.

News of the Trade

Danforth Sash Factory, 4 Palmer Ave., was recently registered in Toronto.

Reeves & Son, cabinet makers, were recently registered at Montreal, P.Q.

Boisse & Racicot, Sherbrooke, Que., contemplate the erection of a hardwood flooring plant.

T. M. Fox & Sons, Limited, Montreal, P.Q., were recently registered as manufacturers of glue.

S. Oakes, Strathroy, Ont., contemplates erecting a new planing mill and is in the market for some new equipment.

The Ideal Art Reed Mfg. Co. was recently registered in Montreal, P.Q., with John Fisk & Edwin Warren as partners.

Recent Montreal registrations include the Dawson & North Pattern & Metal Works and the Universal Pattern Works.

The Montreal Development Co., of St. John, N.B., have commenced work on the sixty bungalows they are erecting at Fairville, N.B.

The thirteenth annual meeting of the Canadian Lumbermen's Association was held recently at the Chateau Laurier, Ottawa.

Mason & Risch, Limited, Toronto, Ont., have been authorized by suplementary letters patent to increase their capital from $1,000,000 to $1,500,000.

The plant of the Universal Toy Co., Toronto, was damaged recently by fire. Both the building and contents suffered. This plant is operated by two returned soldiers.

The building permits issued in Kitchener for 1920 show an increase of $61,000 over those of the preceding year. The figures are $1,238,000 for 1920 as against $1,176,000 for 1919.

Keystone Transports, Limited, Montreal, P.Q., have been granted a federal charter of incorporation to manufacture and deal in ships, barges and other craft. Capital, $5,000.

In Toronto the building permits issued for 1920 show a value of $25,785,000, as against permits with a value of $19,819,000 for 1919, showing an increase of about $6,000,000 for 1920.

T. B. Spratt, manager of the Harbor Marine Shipyard, Victoria, B.C., states that his company contemplate dismantling their plant and disposing of the machinery and equipment.

The plant of the Scotia Woodworkers, Limited, Oxford, N.S., was recently damaged by fire. While the plant was not a total loss the damage amounts to $100,000. This is only partially covered by insurance.

Canadian Dolls, Limited, Grimsby, Ont., have been incorporated to manufacture and deal in dolls and all kinds of toys. Capital, $50,000. J. S. Christie, clerk, and G. B. McConachie, barrister, both of Grimsby, Ont.

J. Stanley Wedlock, Charlottetown, P.E.I., has secured a large stand of birch and is planning on equipping a cheese-box factory. He figures on an output that will take care of the requirements of the Maritime Province trade.

The Sheperdson Building Co., of New Liskeard, Ont., who have been manufacturing ice cream tubs and cabinets, are branching out and adding box and wash-boards to their line. To this end they are opening a new box factory.

The Clothespin Factory at Orillia, Ont., formerly conducted by the late J. G. Stephenson, is being offered for sale. The equipment consists of one swing shingle saw, cut-off saw, sticker, rumbler and a small amount of equipment.

J. Coughlan & Sons, Limited, Vancouver, B.C., have re-opened their shipyard with a large force of men, numbering approximately 1,000. The freight steamers of 1,300 tons each, are being constructed at a cost of about $3,000,000.

Many of the large Ottawa woodworking firms are closing down, some for an indefinite period. About 300 employees will be out of work. It is stated that one of the largest of these concerns will re-open again on February 1st.

The by-law, recently voted on, granting certain privileges to the Oakville Basket & Veneer Co., was not carried owing to the fact that it did not receive the necessary two-thirds maority. The vote was 258 for and 131 against the by-law.

The Reynolds Machine Co., Massillon Ohio, manufacturers of automatic screw-driving machinery, have announced that they are making material reductions in the prices of their line of equipment, the new prices taking effect as from January 3rd, 1921.

Fromson Company of Canada, Limited, Montreal, were recently granted a federal charter to manufacture and deal in gramaphones and cabinets. Capital, $100,000. P. Bercovitch, K.C., and R. L. Calder, both of Montreal, are two of the incorporators.

Laiterie Ferme Saraguay, Limitee, Montreal, P.Q., have been granted a provincial charter to manufacture and deal in stoppers, boxes and other wooden products. Capital, $50,000. H. Grou and J. A. Grou, both of Montreal, are two of the incorporators.

Montreal Motors Corporation, Limited, Montreal, P.Q., have been incorporated to manufacture and deal in automobiles, carriages and other wooden vehicles. Capital, $99,000. J. M. Larocque and J. Larocque, both of Montreal, are two of the incorporators.

Tippet & Co., Limited, Montreal, P.Q., were recently incorporated to manufacture and deal in toys, musical instruments and all kinds of furniture. Capital, $15,000. H. N. Chauvin, K.C., and H. E. Walker, both of Montreal, are two of the incorporators.

E. S. Bryant Pattern Works, Limited, Windsor, Ont., were recently granted a provincial charter to manufacture and deal in wood and metal patterns. Capital, $40,000. E. S. Bryant and E. J. Manner, both of Detroit, Mich., are two of the incorporators.

A company known as the Dion Knife Co., Vancouver, B.C., has been formed to manufacture thin high speed and inlaid planer and moulder knives. Mr. Dixon, the organizer of this company, has had considerable experience in the manufacture of knives.

The Liverpool Woodworking Co., Limited, Liverpool, N.S., who conduct a general woodworking business, are branching out and adding a line of oak mantels. Other lines produced include wood ships, blocks, mast hoops and small boats and dories.

J. G. McGuire, Limited, Ottawa, Ont., have recently been incorporated to manufacture and deal in automobiles, trucks, carriages and other wooden vehicles. Capital $60,000. J. G. McGuire and C. F. Gervan, both of Ottawa, Ont., are two of the incorporators.

The late John F. Dodge and Horace Dodge, of the well-known automobile manufacturing firm of Dodge Bros., each left an estate which is valued at approximately $55,000,000. The inheritance tax on these estates will run from $10,000,000 to $15,000,000 each.

Canadian Perfect Wheels, Limited, Listowel, Ont., have been granted a federal charter of incorporation to manufacture and deal in all kinds of wooden wheels. Capital, $100,000. Two of the incorporators are G. Melrose and M. K. Becker, both of Listowel, Ont.

Interprovinciale Ltee., St. Pie, P.Q., manufacturers and wholesale dealers in funeral equipment, are enlarging their plant. A two-storey addition, 145 ft. x 50 ft. and a number of smaller buildings are being added. This firm are in the market for considerable equipment.

Queen City Furniture Co., Limited, Toronto, Ont., have been granted a provincial charter to manufacture and deal in furniture, toys, dolls, boxes and other wooden products. Capital, $100,000. R. Shapiro and J. C. Fitzgerald, both of Toronto, are two of the incorporators.

McConnell & Ferguson, Limited, London, Ont., have been granted a federal charter to manufacture and deal in wooden boxes, cabinets and other wooden products. Capital, $400,000. Morley Smith and G. M. Huycke, barristers, both of Toronto, are among the incorporators.

A prize for locating the biggest tree in New York state has been awarded to Chas. J. Richards, editor of the "Gowanda News." The tree in question was an elm 34 ft. 2 in. in diameter at a height of 30 inches above the ground. The total heighth of the tree was well over 100 feet.

The Mount Forest Casket Co., Mount Forest, Ont., are making changes of a more or less extensive character in an endeavor to extend their business. A four-storey addition, 42 ft. x 80 ft., is being erected. This will increase the capacity of their plant and enable them to get out many new patterns.

Canadian Top and Body Corporation, Limited, Fort Erie, Ont., were recently granted a provincial charter to manufacture and deal in automobile bodies and tops. Capital,

Are you sure you haven't overpaid him?

He is paid on the basis of the time you have purchased from him. But how about his productive time? Can you check it up to make sure that it tallies with the hours he sold you? You should be able to and you would if you have an accurate system of Job Time Recording in your factory.

INTERNATIONAL
JOB TIME RECORDERS

installed in each department will give you an accurate, unchangeable and indisputable record of each employee's productive time. They will show you which are the profitable workers and which are the unprofitable.

And no intricate and unwieldy system is necessary. With Internationals these records are always available at a moment's notice and you can depend upon them. It's only another step to compare them with the time sheets and you have the facts

It is the knowledge of these facts that leads to greater profits for your business and meritorious pay envelopes for your employees.

No manufacturer can afford not to reduce to the lowest possible figures the difference between his purchased hours of labor and his productive hours of labor. It is an important item in the present-day scheme of industry.

Thousands of manufacturers are depending upon the infallible records of International Job Time Recorders. Let us prove to you that they would be indispensable in your factory too.

International Business Machines Co.

LIMITED

F. E. MUTTON, Vice-Presideut and General Manager

Head Office and Factory: 300-350 Campbell Avenue, Toronto

Also manufacturers of Dayton Scales and Hollerith Electric Tabulators

$100,000. L. L. Odette, of Sandwich, Ont., and W. C. LaMarsh, barrister, of Chatham, Ont., are two of the incorporators.

The Canadian Loader & Body, Limited, Montreal, have been granted a federal charter to manufacture and deal in motor trucks and other vehicles and an apparatus called "loaders" for all kinds of vehicles. Capital $200,000. A. Salmon and D. B. Viger, both of Montreal, are two of the incirporators.

National Picture Frame and Art Company, Limited, Toronto, Ont., have been granted a federal charter to manufacture and deal in mouldings, picture frames and other wooden products. Capital, $100,000. Two of the incorporators are J. A. Macintosh, barrister, and D. A. Macintosh, both of Toronto.

The Office Specialty Mfg. Co., Limited, Newmarket, Ont., recently prepared an interesting chart showing the increased costs of the various materials entering into their line of office equipment. The information is shown in a comparative form, giving pre-war quotations as well. About 100 items are listed.

Manitoba Shipbuilding Corporation, a corporation in the state of Wisconsin, has been granted an extra provincial license to carry on business in Ontario and to build, purchase, sell, operate and repair ships, barges, dredges and vessels of all kinds. The company is authorized to spend the sum of $40,000 in the province.

Ryan & Hughes, Limited, Toronto, Ont., were recently granted a provincial charter to take over the business and interests of Ryan & Hughes, Toronto, and to manufacture and deal in clocks, pictures and all kinds of furniture. Capital, $100,000. T. L. Monohan and G. Keogh, barristers, both of Toronto, are two of the incorporators.

A provincial charter has been granted to the Pannill Door Co., Limited, Toronto, with a capital stock of $60,009. The company will take over the busines of the Pannill Door Co. and is empowered to manufacture, and deal in doors and sashes as well as conduct business of general woodworkers, contractors and lumber marchants.

The second and third floors of the factory of the Beck Manufacturing Company, Limited, cigar box manufacturers, Montreal, were considerably damaged by fire on January 7th. The blaze, which apparently started either in the flooring of the third floor or the ceiling of the second, burnt a hole through the ceiling a foot from a ton and a half press.

Pierre J. Le May & Cie., Limitee, Montreal, were recently granted a federal charter to take over the business formerly known as Pierre J. Le May & Cie., and to manufacture and deal in automobiles, carriages and other wooden vehicles. Capital, $49,000. W. P. McFeat, Westmount, P.Q., and G. G. Cooke, Outremont, P.Q., solicitors, are two of the incorporators.

H. Lovell & Sons, Limited, Coaticook, Que., have been granted a provincial charter to take over the real estate business of H. Lovell & Sons, and to conduct a general lumber business, manufacturing and dealing in chairs and other articles of furniture. Capital $250,000. Fritz E. Lovell, manufacturer, and A. J. Sparks, lumberman, both of Coaticook, are two of the incorporators.

Carriage Factories, Limited, Orillia, Ont., are devoting considerable attention to the manufacture of bodies for the different makes of motor trucks. This is in addition to bodies, open and closed, painted and trimmed complete for pleasure cars. The Orillia plant has been reorganized to handle these lines advantageously.

According to a report by Trade Commissioner Brady, the market for pianos in Argentina is very similar to that in the United States and Canada. 29 makes of pianos were noted on exhibition in different Buenos Ayres stores which were divided as follows: 7 German, 6 English, 2 French and 1 Spanish. This is a market to which the Canadian piano industry might devote more attention.

Maguire, Patterson & Palmer, Canada, Limited, who were recently incorporated under a federal charter, have been granted provincial papers, permitting them to carry on business in Ontario provided they do not use an amount of capital in excess of $1,000,000. E. A. Dunlop of Pembroke is the company's attorney. This is the company which is erecting the $5,000,000 match factory at Pembroke, Ont.

D. Fullerton & Son, Limited, Pictou, N.S., were recently incorporated to manufacture and deal in wood products of all kinds and to take over as a going concern the business known as "D. Fullerton & Son." The output of this going concern will be confined largely to sash and doors, although all kinds of building material will be worked up. F. Adamson is the president and A. A. Ferguson, vice-president.

Broughton Hardwood Products, Limited, Liverpool, N.S., recently installed an up-to-date dowel plant. The equipment includes three Fay & Egan dowel stickers, two Hawker adjustable-head dowel machines, two Yates self-feed band rip saws and two Ricker bolting machines. They are also installing a Dauber-Bell dowel machine to work up the waste. Their output will be confined entirely to the manufacture of dowels.

The annual meeting of the Halifax Shipyards, Limited, held recently, was presided over by their president, Mr. H. P. Smith. At the present time two ships are under construction and a large volume of repair work is on hand. It was further intimated that the company had in prospect orders for a number of large vessels. This work will be sufficient to keep the Halifax yards as well as those of the Davie Company at Levis and the Tidewater Company at Three Rivers, busy for a considerable period.

The United Growers Packages, Limited, Niagara-on-the-Lake, Ont., were recently incorporated to manufacture and deal in fruit baskets and wood containers of all kinds. Capital $75,000. T. B. Revett and W. H. Hunter, fruit growers, of Lincoln county, are among the incorporators. The fruit growers in the Niagara district were severely handicapped last season due to a shortage of fruit baskets. This seems to have stimulated basket-making in that district, as several new organizations have been formed to manufacture this line.

The Laminated Materials, Limited, New Westminster, B.C., were recently incorporated to manufacture and deal in veneers and panels made of cottowood and to take over as a going concern the business known as Laminated Materials Co. This company use a special waterproof glue, prepared under their secret formula, which renders their product waterproof and impervious to weather conditions. Their output is confined largely to three-ply for the construction of shipping containers. The capital of the new company is $400,000.

The Berliner Gramophone Co., Limited, Montreal, P.Q., recently erected a beautiful memorial tablet on the Lacasse St. side of their new million dollar phonograph and record plant, as a tribute to the men who left their employ to don the King's uniform. The tablet is suitably inscribed and bears the names of all employees who enlisted, including two who paid the supreme sacrifice. Lieut.-Col. McMullen of St. John, N.B., officiated at the unveiling of the tablet at which the directors, officers and a large number of employees were present.

John W. Frid, of the well-known Frid Construction Co., Hamilton, Ont., recently expressed the opinion that in the near future building costs will undergo a reduction of at least 20 per cent. That no marked reductions in prices in this industry have taken place so far, is due largely to the fact that this is a very slack period for builders. The outlook for 1921 is, however, very promising, and while costs of building are bound to decline, he felt certain that the trade in general would be better off, as lower prices mean grater building activity.

Reports to the Manufacturers' Aircraft Association from operating companies in the South indicate that society is manifesting an increasing interest and confidence in travel by air. The latest word to this effect is from the Aeromarine West Indies Airways, Inc., which reports the transportation over the week end (Dec. 18-20) of Lord Waldorf Astor and party of nine from Miami to Bimini. The distinguished tourists chartered one of the Aeromarine Navy cruisers, fourteen passengers capacity, operating regularly between Florida and West Indian ports.

Germany is gradually regaining her former position in the toy markets of the world. In 1914 the total value of toys imported from Germany to the United States was $7,718,000. This decreased to practically nothing during the war, but this year the importations are valued at $3,800,000, which means that within two years she has succeeded in recovering about 50 per cent. of the toy trade formerly done with America. During this same period the Japanese manufacturers have not been idle. In 1914 they shipped $435,000 worth of toys into the States, while in 1920 this has been increased to $5,075,000.

At the close of their fiscal year, September 30th, the Canada Car & Foundry Co., Limited, Montreal, P.Q., had unfilled orders on hand to the value of $26,000,000. This compares more than favorably with the orders on hand at the close of their fiscal year, 1919, which amounted to $8,500,000. This large amount of unfilled business ensures a

QUARTERED OAK

There is hardly a wood that varies in quality to the extent that does Quartered Oak.

The real intrinsic value of the same grade may vary 50% and even more depending on character of timber, method of manufacture, etc.

Our Quartered Oak is manufactured from our own virgin growth timber than which there is none finer to be had. We cut only the very cream of our logs into this wood. We manufacture no veneers, veneer flitches nor do we sell any of our best logs for veneer—no diversion of part of our logs to bring down the quality or average width of our product—the very best of it goes into our Quartered Oak lumber. Very few mills pursue such policy.

Our Quartered Oak is "full quartered" insuring the best possible figure; every piece plump thickness and all the wide in.

Thus we are able to offer the acme of quality in Quartered Oak, either White or Red.

Also sole producers of "the kind that's different" in Gum—it's straight, bright and flat.

GENERAL OFFICE: GREENWOOD, MISS.

Band Mills: Greenwood, Miss., Moorhead, Miss.

steady output for some time to come. Taking into consideration the improved labor conditions and the fact that the bulk of the materials required to handle this business is now on hand, the directors are hopeful that the results for the ensuing year will prove very satisfactory.

The Collingwood Shipbuilding Co., who have undertaken to complete the unfinished hulls in the yard of the Dominion Shipbuilding Co., Toronto, are having considerable trouble in securing workmen. The company are offering 75c per hour, while the union workers are standing out for 90c per hour. Most of these men have been idle since the Dominion Shipbuilding Co. ceased operations some months ago, and one would think that 75c an hour would appeal to them far stronger than standing around in idleness while holding out for a higher figure. The whole question is being referred back to the Dominion Government and it is hoped that a satisfactory arrangement will be arrived at speedily.

The Winnipeg Motor Cars, Limited, Winnipeg, Man., were recently incorporated with a capital of $1,000,000, to manufacture and deal in motor cars. The company have purchased the Rat Portage Lumber Company's property on Marion St., and are altering the plant to suit their requirements. The new car, which will be known as the "Winnipeg," will have a 4-cylinder engine and will be made in the usual bodies. It is designed to sell at about $1,700. A line of 1½ and 2-ton trucks may be manufactured in the near future. The personnel of this company is as follows: F. A. Ogletree, president; L. Arseneault, vice-president; C. L. Lane, mechanical superintendent, and D. E. Ogletree, secretary-treasurer.

Knox Bros., Limited, Montreal, P.Q., lumber dealers, have purchased the plant of the Davies Shipbuilding & Repairing Co., Limited, at St. Joseph de Levis, P.Q., and are equipping it with the machinery needed for remanufacturing lumber. This company has a large quantity of B. C. timber on their hands and in addition about 10,000,000 feet of Quebec spruce left over from export contracts. In order to market the material advantageously, they decided to equip an up-to-date saw and planing mill at Levis to remanufacture this stock. The installation includes an 8-foot band saw, a number of 6-inch band resaws, together with six planers. It is the intention to equip a plant for making box shooks in the near future. The present owners believe that when they have their new plant operating to full capacity, it will be one of the largest woodworking installations in Canada.

The Gold Medal Furniture Mfg. Co., Limited, recently held a sales convention at their head office in Toronto. This convention marked the thirtieth birthday of an organization which has steadily developed from a small beginning up to the present large organization operating factories at Toronto, Montreal, Winnipeg, Man., and Uxbridge, Ont. W. J. McMurtry, who founded this business thirty years ago, is still actively engaged as its president and general manager. He presided over the convention. Managers and superintendents from the four factories and fifteen of the firm's representatives from Coast to Coast were in attendance. The first two days of the meeting were taken up with inspecting the plants at Toronto and Uxbridge. This firm is justly proud of the enviable record they have attained during thirty years of aggressive manufacturing and merchandising.

Personals

Edward Clark, of Edward Clark & Sons, Toronto, Ont., wholesale lumber dealers, left recently to spend the winter months in California.

J. A. McFadgen, president of the Manufacturers' Lumber Co., Stratford, Ont., left recently, with a party of Canadian curlers, for a two-months' trip to Scotland.

Chas. Baetz, of the Baetz Bros. Furniture Co., Limited, Kitchener, Ont., was re-elected alderman for that city. Mr. Baetz made a very good showing, being second on the list.

J. B. Leadley has been appointed city clerk of Guelph, Ont. Mr. Leadley has for many years been connected with the staff of the Bell Piano & Organ Co., Limited, of Guelph.

John Hall, Toronto, Canadian representative of the W. M. Ritter Lumber Co., Columbus, Ohio, returned recently from a holiday in Virginia, and other lumber-producing states.

Gordon Kribs, manager of W. A. Kribs Co., Limited, Hespler, Ont., manufacturers of washing machines and freight handling trucks, was elected alderman, at the civic elections held recently in Hespeler.

At the civic elections recently held in Chesley, Ont., the following furniture men were elected to office: J. W. Heiserman of the Chesley Furniture Co., reeve; W. E. Durst of the same firm, councillor; and W. P. Krug of The Krug Bros. Co., Limited, councillor.

Walter T. Piggott, of the Piggott Lumber Co., Windsor, Ont., was recently married to Miss Josephine Smith, daughter of Mr. and Mrs. Angus McD. Smith. The many friends of Mr. Piggott in both the lumber and woodworking trades extends congratulations and wish this popular woodworker and his bride a long life and a happy one.

H. R. Magwood, of the F. E. Coombe Furniture Co., Limited, Kincardine, Ont., was recently elected councillor for 1921. This will be Mr. Magwood's second term in office. In this connection it may be of interest to note that Mr. Magwood headed the poll and received the largest number of votes ever cast for a councillor in any municipal election in Kincardine.

Obituary

James Sparling, who operated a planing mill at Meaford, Ont., died very suddenly recently at his place of business. In addition to the planing mill, he conducted a building and contracting business.

Chas. Turner recently passed away at his home in Penetanguishene, Ont. Mr. Turner conducted a woodworking factory in Toronto for many years. Upon moving to Penetang he received a Government appointment as head carpenter, which position he held for thirteen years.

Wm. Edwards recently passed away at his home in Gananoque, Ont. Mr. Edwards was one of the pioneer business men of that town and established the furniture manufacturing and retail business, now being carried on by Wm. Edwards, Jr., over 50 years ago. At one time Mr. Edwards built many boats and yachts. He is survived by two sons, Andrew, a well-known traveller, and William, who is carrying on the business.

Harvey Derne, superintendent of manufacture of the W. M. Ritter Lumber Co., Columbus, Ohio, was killed recently in an automobile accident. Mr. Derne had a wide circle of friends in the lumber and wood-using industries and his sterling qualities as a man, coupled with his business ability and technical attainments, made him a prime favorite and gave him a place of distinction in industrial circles. He had a complete understanding of the various details of the practical problems pertaining to everp branch of hardwood lumber manufacturing and was considered to be one of the leaders of the hardwood industry.

Calendars, Catalogs, Etc.

The Wayne Lumber Co., New York, N.Y., have issued an attractive calendar. The illusaration shows a scene in the log yard of their Airdondack mills and depicts the unloading and piling of the raw product. This firm specializ in birch and beech.

A very attractive calendar has been received from the Wilson Box Co., Limited, manufacturers of wooden boxes, St. John, N.B. The picture, which is entitled "Anxious Moments," depicts a pioneer and his Indian guide, shooting a particularly wicked-looking stretch of rapids..

An attractive and useful holiday souvenir, in the form of a brass ash container or ash tray, has been received from the Perkins Glue Co., Lansdale, Pennsylvania, manufacturers of Perkins' vegetable glue. This ash tray is made in two parts so that it may be taken apart apart to empty.

The Pickrel Walnut Co., St. Louis, Mo., are sending out a useful and attractive calendar in the form of a wall pad. The numerals are large and conspicuous, being about 4 inches high. The scene shown is a view of their log pond, and gives an idea of the large number of logs which they keep on hand.

One of the good old-fashioned office calendars, with large plain figures, has been received from Messrs. Palmer & Parker Co., importers and manufacturers of mahogany, hardwood lumber and veneers, Boston, Mass. This well-known business is rapidly nearing the century mark, having been established in 1833.

FOR SALE

Planing mill on the Canadian National Railways, between Levis and Mont Joli, doing a Milling in Transit business, with work ahead guaranteed for several months at profitable prices. Fully equipped with Planer, Sticker, Resaw and Ripper, handling several cars daily, with siding capacity of nine cars, right in the heart of lumber section of this Province, where more than ten times mill's capacity has been refused during the past year. Mill built of Cement with Cement Floor, Asbestos Roof, with additional buildings for Sash and Door factory or box factory, and sheds for piling dressed lumber, also with piling ground for about half a million feet of lumber. Price $30,000.00 on terms that will be satisfactory. A live man or group of men can easily clean up $2,000.00 per month net profit, and mill can be extended for increased business very easily. Principals only. If interested write to Box 106, Canadian Woodworker, Toronto, Ont. 1-3

Slow Running Belts Inefficient

Belting experts often find fault with the low speeds at which belts are being run, these low speeds being the cause of inefficiency and waste power. Wherever possible, belts for transmitting power should be run at from 4,000 to 4,500 ft. per minute, but they are frequently run at only 1,000 ft. per minute. As a result, wide belts are being used when a narrower belt, running at a high speed, would prove both cheaper and better. In addition, bearing pressures would be lessened and the friction and accompanying wear and power consumption reduced; thus, the expense for belts, fuel and oil would be decreased to a considerable extent.

Materials Used in Dry Kiln Construction

Any of the ordinary building materials — wood, brick, tile, or concrete—may be used in the construction of a dry kiln. The choice between them will depend upon the relative importance of the first cost, maintenance, and fire hazard. The following comments on each type are based on the experience of the U. S. Forests Products Laboratory.

Where insurance rates permit, a well-built wood kiln is very satisfactory, wood being a very good insulator, easily repaired, and cheaper than the other materials. The chief objection to the use of wood, aside from fire risk, is its tendency to swell and shrink with alternate moist and dry conditions, causing more or less working of the frame and loosening of nails. All lumber should be thoroughly seasoned. Fir, Douglas fir, yellow pine, redwood, cypress, and simliar woods with low shrinkage rates should be used for sheathing and sills. For frame timbers any good straight-grained material is suitable. The sheathing should be shiplap laid horizontally and nailed twice at each stud, in the middle and at the bottom of the board. Outside walls should be sheathed on both sides or sheathed inside and plastered outside. They should also be insulated with a good moisture-proof, heat-resistant insulator. The ordinary quilt insulations sewed between so-called waterproof paper have not proved satisfactory in dry kiln construction. Walls should be painted on the inside with asphaltic paint. Where lumber is plentiful, crib or laminated construction may be used, the walls being built up of 2 by 6 inch planks laid flat, and the roof of similar material laid tight together. If the planks are well seasoned and well manufactured, this form of construction permits very little heat loss; but if the lumber is low grade and knotty, a tight, weather-resistant construction is extremely difficult to obtain. The shrinkage of the walls is excessive, and causes considerable trouble at door jambs and where pipes pass through the walls.

Brick or hollow tile is procurable almost everywhere, and where permanency is desired is usually more satisfactory than wood. The brick or tile should be hard burned. The walls should be laid up in tempered or cement mortar. Unequal expansion in the exterior walls, caused by the difference in temperature of the outer and inner faces, is almost certain to create numerous small cracks, which should be painted up with an elastic cement rather than mortar. A kind tile should be chosen that has openings running horizontally rather than vertically in the wall. The tile should be scored for plastering. Both sides of tile walls should be plastered with cement mortar. When brick, tile, or concrete kilns are over 50 feet long, it is advisable to build both the exterior and interior walls 12 inches thick, particularly if fireproof roofs are used.

Walls of monolithic concrete or of concrete blocks are highly absorbent of moisture unless thoroughly water-proofed. It is very difficult to hold a high humidity within a kiln whose walls absorb moisture readily. The heat loss through such walls is also very great.

The direct motor drive saves the cost of upkeep of a belt. This is a considerable item on some machines.

Badly worn rubber bands on band saw wheels should be replaced as they cause the blades to break.

Hardwood Lumber

has for some time been selling below replacement value. Improving business conditions must lead to enlarged demand. Are your orders placed to anticipate these needs? Let us quote you on our lines of

Automatic Hole-Cutting Machines

The Wheel and Hole Cutting Machine has four automatic movements, all of which work in perfect unison, performing their functions in clock-like regularity.

The Hand-Hole Machine will cut hand holes in crate and box ends. It is worked by a carriage and levers, and will cut any size or length hole with either round or bevel edge in any kind of wood.

WRITE FOR NEW DESCRIPTIVE CATALOGUE.

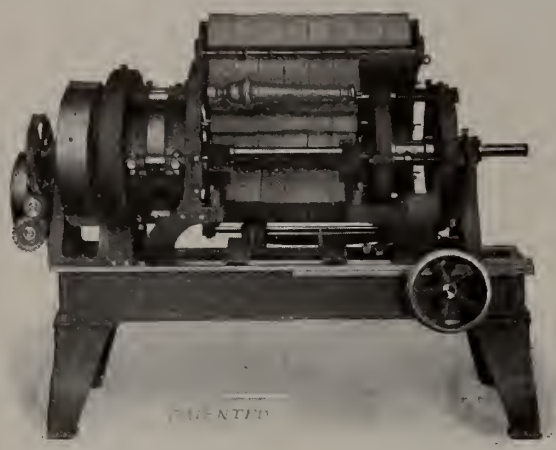
JUST A MINUTE



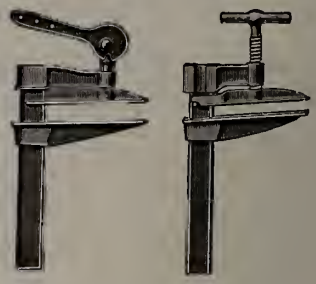
Saved may not amount to much, but a machine that can save $2,000 to $3,000 a year is well worth investigating.

The Nash Sander for furniture turnings has done just that for many a furniture manufacturer.

Why not for you?

J. M. NASH, Milwaukee, Wis.

Colt's Clamps
for the
Woodworker



Colt's Universal and Vise Clamps are unsurpassed for the Furniture Manufacturer and General Woodworker. They are made right, both in design and quality of materials and workmanship.

Colt's Clamps are quick-acting and have broad jaw clamping surface.

For further information write for Catalogue No. 294.

SIMONDS
SAWS and KNIVES

Are made right. Every operation from the making of the steel to the finishing and packing is watched by experienced workmen. The latest appliances known to the metal trades are used to insure the quality of SIMONDS Saws and Knives. After each operation they are inspected by experts for defects in quality and workmanship. The result—as good a saw as human skill and science can make. Prove it to your own satisfaction. Let us quote you on the tools you need.

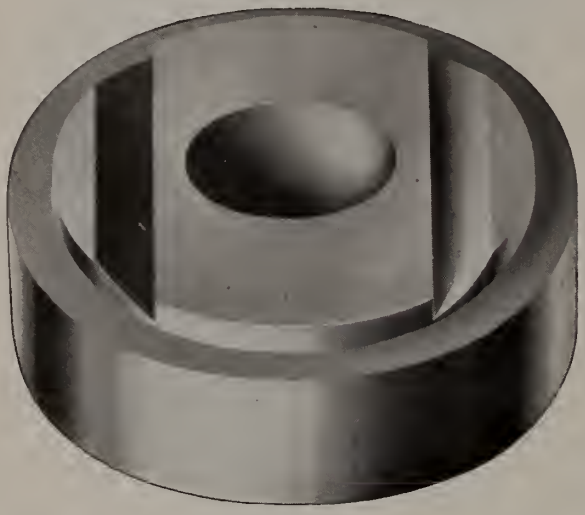
THE SHAPER MAN'S DREAM

THE KNOUREK PATENT

Ball Bearing Shaper Guide Collars

A Decided Improvement Over the Revolving Solid Collars Now in Use



Patent applied for

Ball-bearing Shaper Guide Collars are made with grooves as shown, for flat knives, and without grooves for solid steel cutters.

ORDER A SET ON 30 DAYS FREE TRIAL

The friction set up by stock or patterns bearing against solid revolving collars is entirely eliminated when ball-bearing shaper collars are used. Every shaperman knows the effect of this friction on stock being run, and so will appreciate the real value of these new shaper collars.

In the operation of the ball-bearing collar, the outer shell is free from the slotted collar proper and ceases to revolve with the spindles when pattern or stock comes in contact with it. It does not stop entirely but simply rolls along with the feed of the work. In this way there is no friction whatever between the collar and the work, therefore the edge surface can neither be burned nor worn down.

To save your patterns, stop spoilage of stock and in an easy manner, enable your operator to do more work, you should try out these new ball-bearing shaper collars —note the results by actual operation in your own plant.

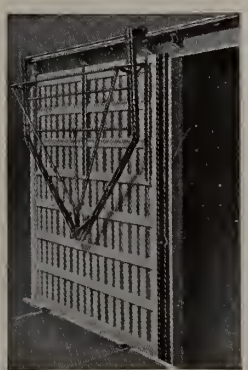
BRANTFORD

The Door Carrier System



Makes your dry-kiln doors steam-tight and saves time, heat, trouble and money.

Carrier lifts door clear of kiln and carries it down track. Returning, deposits door to rabbeted joint, where it is held steam-tight by its own weight. Applicable to old or new kilns.

Ask for catalogue.

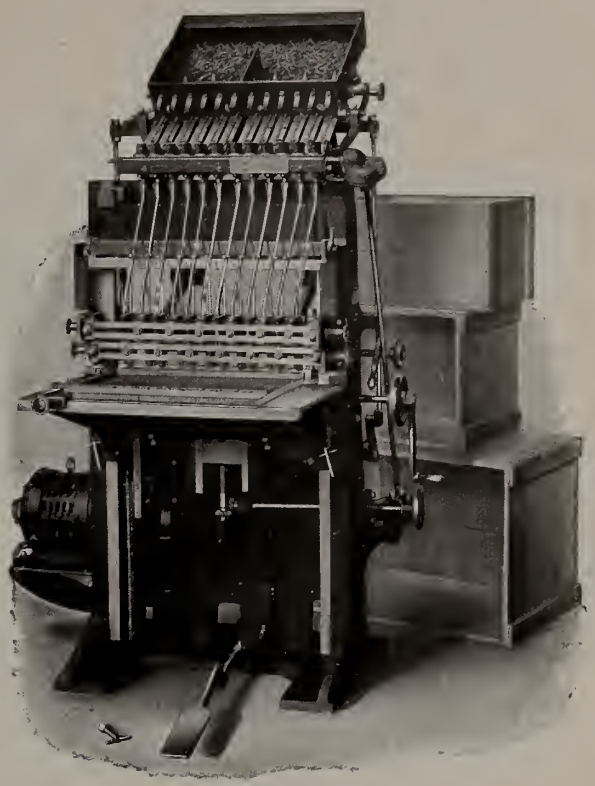
Regular machines for all sizes of boxes and crates.

Write us for descriptive literature.

Machines that save money

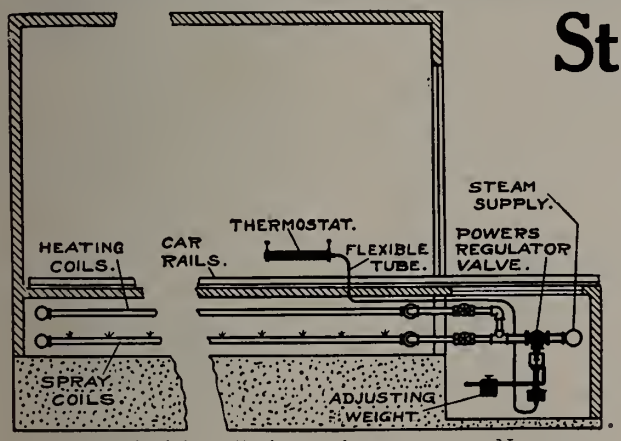
Morgan Machine Co.

DEPT. A ROCHESTER, N.Y.



Morgan No. 12-30 Open Back Nailing Machine, Fitted with motor.

Automatic Temperature Control Standardizes Product



Typical installation of a powers No. 15 Regulator in a Lumber Dryer. Adjusting weight may be moved outward to give progressively higher temperature. This regulator in charge of the temperature, results in practically automatic humidity control.

Personal attention to temperature control is expensive and always unsatisfactory. An automatic regulator gives definite results.

Standardization means less loss, a better product, and more profit.

Powers Heat Regulators are successfully used in the control of dry kilns, varnish rooms, glue heaters, washing and dyeing processes, bleaching equipment, chemical treaments, plating solutions, and many others too numerous to mention.

Write for Bulletin 138.

Put any problem of temperature control up to us. Our experience of 30 years is at your service.

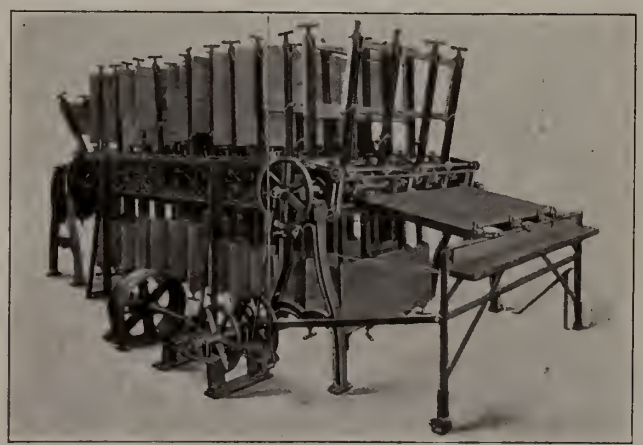
One Man Does the Work of Two
with a Billstrom Glue Clamp Carrier



For every plant where much edge-gluing is done there is a real need for a Billstrom.
Here's why:—

The empty clamp is held at just the right height for the greatest convenience of the workman.
When the clamp is filled he pulls a cord, which carries the filled clamp away and deposits an empty one in its place.
One man can accomplish as much by using it as two men can do employing the old methods.
It holds the work off the floor until the glue has set, when the glued stock can be quickly removed and piled flat, thus greatly conserving space.
It reduces the labor and cost of edge gluing to the minimum.
There is a sizs to suit your particular requirements.

N. J. BILLSTROM
2002 NINTH ST. ROCKFORD, ILL.

44 Yates No. 275
36 and 66-in. Automatic
Knife Grinders,
Brand New, at
One-half Price

Machines arranged for Motor Application as per cut, or regular belt drive, if wanted.

We have in Cincinnati, available at once, three Whitney 30-in. single surfacers and two Whitney 30-in. double surfacers, all with sectional rolls; three double arbor revolving saw tables; three single arbor tilting table saw benches; F.&E. single-end tenoner with roller table, and a few other choice machines. All are in exceptionally fine condition—are doing precision work at the present time.

7 New Hermance Molders, 8, 10 and 12-in., Stationary and slip-on heads.
8 New Andrew Multiple Vertical Borers, 20, 30, 42 and 60-in., any number of heads.

Band saws, 32, 36 and 38-in.
Borer, Andrew, 10-ft., 13-spindle, power table.
Borers, Andrew mult. vert., 20, 42 and 60-in., new.
Door clamp, Fay-Egan, heavy.
Door clamp, Jenkins-Hayes power-feed.
Edgers, two, three and four saws.
Glue cookers and retainers.
Jointers, 8, 12, 16, 20, 24 and 30-in.
Lathes, speed, eight, mounted on iron bed.
Lathes, turning automatic, Mattison No. 8 Yates No. 72, practically new.
Matcher, American Northwest, 24x8-in., 3 sides.
Matcher, 24x6-in., 3 and 4 sides.
Molders, 4-side, 9, 10 and 12-in. American.
Molder, Fay & Egan, 12-in. outside, heavy.
Mortiser, chain saw, New Britain No. 7, new.
Mortisers, F. & E. vertical, hollow-chisel; also plunger type; Greenlee vertical, double hollow-chisel.
Nailers, two, Hayes, 8-track, 8d, closed back.
Nailing machines, 2 closed back, 4-track, 4d, 15-in. spread, Hayes' make.
Pony planers, 16, 20 and 24-in.
Rip saws, self-feed, Hoosier, F. & E. Greenlee.
Rip saw, gang, Luther, for box work.
Router for stair stringers.
Sand belt, closet seat and similar work.
Sander, H. B. Smith, spindle and disc, practically new.
Sanders, 30- 42 and 54-in. Columbia; 30, 42 and 48-in. Invincible; 30 and 36-in. F. & E. double.
Saw, 8-ft. double cut-off, roller table.
Saws, combination and variety, single and double arbor, also tilting arbor, stationary and tilting table, 24 and 30-in. circular resaw.
Saw, circular re-slab, 40-in. blade, power feed rolls.
Shapers, Fay single-spindle reversible, also Shimer single with overhead routing attachment.
Shaper, Whitney No. 7 and 8 double-spindle, practically new.
Surfacer, 30-in. double, cabinet, B. & M., practically new.
Surfacer, Whitney 30-in. double, sectional roll and sectional chipbreaker; American No. 4½, 36-in. sectional and solid; Fay & Egan No. 140, 27 and 30-in. double divided rolls; also 18, 20, 24 and 30-in. single cylinder panel planers.
Tenoners, Fay & Egan double-end, also single-end.
Window frame machine for production work, new.
Window frame machines, Smith & Phillips combination.
Wood-worker, universal, Fay & Egan and Bentel & Margedant. One lot of glue room machinery.

We have just received two carloads of Band Saws and Jointers—all new—which are ready for immediate delivery.
Band Saws, 20, 26, 32, 36 and 38-in. Jointers, 8, 12, 16 and 24-in.

Rub Your Varnish Electrically

with a

MATTISON
ELECTRIC
Rubbing Machine

—operates direct from a lamp socket

By doing the work of two hand rubbers, the Mattison Electric cuts wages 50%, thus paying for itself many times over every year. It is a power unit complete in itself, consumes very little current, and requires no special hose or piping.

Any flat varnished surface, larger than the machine itself can be rubbed to better advantage with this portable electric rubber than by any other method.

The machine is very easy to handle, and relieves the operator of all the hard labor of hand rubbing. His attention is concentrated on his work; and with the machine he produces a finish much more uniform than is possible by hand.

Ask for bulletin "165" and get detailed information

Model 1-D Portable Drill

HANDY—ECONOMICAL—EFFICIENT

Specifications:

Length—10 inches.

Weight—4¾ pounds.

Capacity—Steel, 0 to $\frac{3}{16}$". Wood and alloys, 0 to $\frac{1}{4}$".

Motor—Universal, on either direct or alternating current.

Diameter of Motor—3⅜ inches.

Spindle—Offset from center $\frac{3}{32}$".

Helical Gears.

Aluminum Handle.

Complete with 10-ft. cord, plug, switch and chuck.

Jacob's Chucks used as a regular equipment.

FOR speed in drilling and countersinking small holes, this tool is just what you need. It can be used on any kind of material—steel, iron, brass, aluminum or wood—and gives lasting service.

If your dealer cannot supply you with the Model 1-D, tell us about your requirements.

FIRST CLASS MECHANICS

used these tools in a plant operated by large departmental store for manufacturing high grade fixtures; these

Machines are in the Best of Condition

and are offered at prices which are sure to interest you now that business is showing such a pronounced improvement.

1—McGregor-Gourlay Double Arbor Universal Saw Table, same as C.M.C. No. 618, with 14″ saws, self-contained countershaft, full complement of gauges, saws, wrenches, etc.

1—Ditto as above.

1—Ballantine 36″ Band Saw, with solid lower wheel, complete with saw blades, wrenches, etc.

1—McGregor-Gourlay Two Spindle conical Bronze Bearing Shaper, with plain countershaft, 24″ centers, 1⅛″ spindles, roller bearing loose pulley, complete set fill-up collars and knife collars and table rings, wrenches, etc.

1—Cowan Chain Saw Mortiser, equipped with full set of bars, sprockets and chains for ¼″, ⅜″ and ½″ mortises.

1—C.M.C. No. 624 Hand Feed Rip Saw Machine, with self-contained counter shaft, table 6′6″ long by 40″ wide, with plain box gauge, 22″ saw blades, 1¼″ arbor with cone for receiving saws different diameter.

1—Ballantine 8″ Four Sided Moulder, complete with square heads and straight knives on all spindles.

1—Goldie-McCulloch Single End Tenoner, roller carriage with single heads, double copes, no cut-off saw attachment.

1—Ballantine 16″ Buzz Planer with square cylinder, full set of knives and countershaft.

1—C.M.C. No. 646 Roller Table Cut-off Saw, sliding table 7′6″ long, stationary table 50″ to the saw sliding table equipped with stop gauge, including five stops, with countershaft, complete with saws, wrenches , etc.

1—Yates No. 156 27″ by 6″ Single Surfacer with solid roll and chipbreaker, full set of knives, wrenches and countershaft.

1—Cowan Combination Vertical and Horizontal Boring Machine, complete with bits, wrenches, etc.

1—Wood Frame Belt Sander, complete with roller table.

1—Hespeler 12″ Buzz Planer, fitted with round cylinder, full set of knives, countershaft, wrenches, gauges, etc.

1—Ballantine Tilting Table Double Arbor Saw Table, same as C.M.C. No. 616, arbor raising and lowering, fitted with full set of gauges, countershaft, saws, etc.

1—Preston 36″ Band Saw, spoke wheels top and bottom with saws, wrenches, etc.

1—McGregor-Gourlay Variety Saw Table with countershaft, attached, guard, gauges, tilting table, wrenches, etc.

8—Sections Cowan Four Screw Veneer Press 12″x50″, four sections 27″ clear space under screw plates, four sections 32″ under screw plates.

1—24″ Francis Double Roll Glue Spreader.

4—Sections Cowan Three Screw Veneer Press 38″x12″, 28″ clear space under screw plates.

1—American No. 4½ 36″ Cabinet Surfacer, with sectional rolls and chipbreakers.

1—American No. 26, 10″ Outside Moulder, 4″ side heads, latest type machine, complete with knife jointers and all equipment, new straight knives on all four heads.

1—C.M.C. Arm Sander, No. 438, with paper cutter.

1—Universal Knife Grinder, 37″, made by American Wood Working Machinery Co., Fig. 1126 in their catalogue.

1—60″ Sturtevant Single Slow Speed Exhauster, left hand, top vertical discharge, complete with platform and rods to suspend from ceiling.

1—45″ Sturtevant Double Slow Speed Fan, complete with platform and rods to suspend from ceiling.

1—50 H. P. Westinghouse Motor, 3 phase, 25 cycle, 550 volts, 720 r.p.m., with base and pulley, together with circuit breaker and starter

1—Pair 24″ Pulleys.

1—18″ Filing Vise.

1—Foley Band Saw Setter.

The last three items for use in sharpening small size Band Saws.

Condit Type N-2 Oil Switch

Condit Type I Oil Starter

By using Condit Oil Starters and small industrial Oil Switches to protect small motors and small power and lighting circuits in woodworking plants, the fire hazard is eliminated and many delays caused by trouble with small motors not properly protected, is avoided. When a circuit is opened, the arc is under oil which immediately extinguishes it. Thus, serious trouble very often caused by knife switch blades burning in ways which prevent proper contact and allowing a three phase motor to operate on single phase, is obviated.

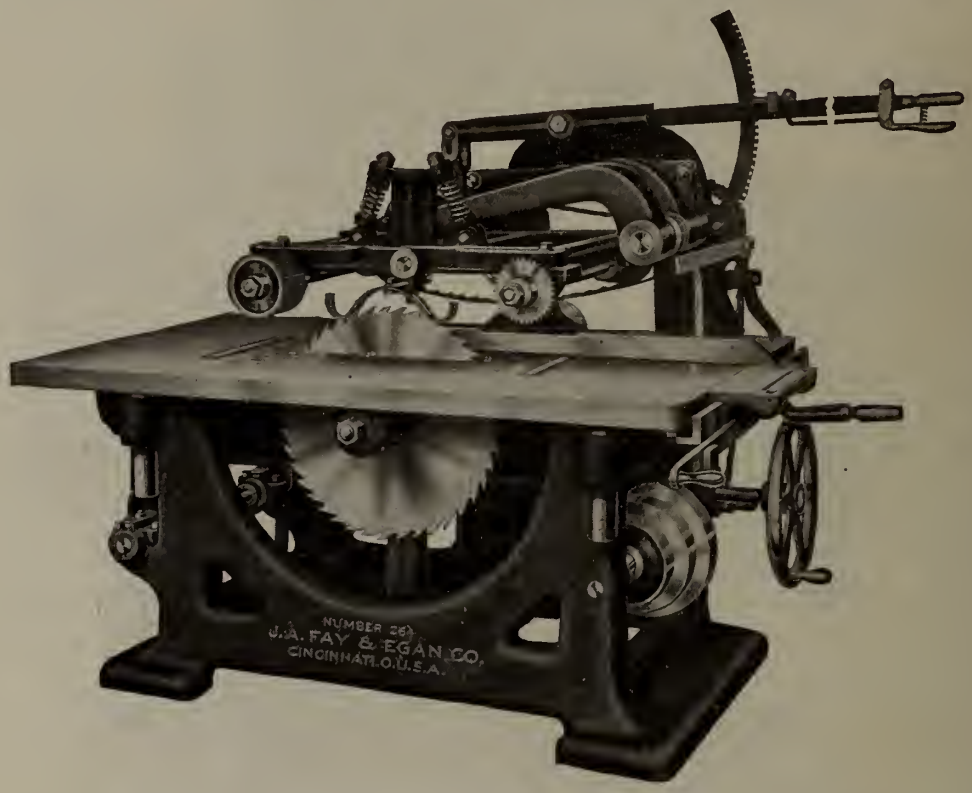
A Modern Machine
for
A Modern Woodshop



No. 264 "Lightning" Self-Feed Rip Saw

For general ripping in planing mills, car shops, agricultural implement works, etc.

No. 264 is a modern high duty machine, suitable for light or heavy work.

Special attention is called to the adjustments, all of which are quickly made from operator's position, greatly facilitating the work and making a large output possible. It has two distinctive features, first table raises by worm segment on four heavy corner posts, insuring an absolutely parallel raise, and second a bearing is built into the center of the machine, supporting saw mandrel close to cutting point of blade.

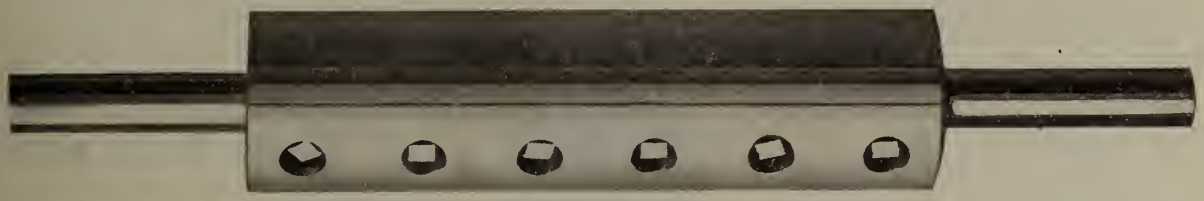
The Shimer Round Safety Cylinder With High Speed Knives



A Round Safety Cylinder that will appeal to the buyer and the user for three reasons:

The first is our adjusting nut for setting the knives. It is the only cylinder with properly located adjusting nuts for setting the knives, which, with our way, can be set to 1/1000 of an inch.

The second is our way of holding the knife without tapping into the head.

The third is the correct angle of cut for the knives.

Made for any of the different makers' machines and in any length of cylinder.

Write for Prices.

GALT, ONTARIO

Drives 1000 to 1200 Screws per hour

—and cuts down labor costs 85%!

The Reynolds Screw Driving Machine with the Magazine Feed does not require a skilled operator. It is very simply handled—just dump a gross of screws (wood or machine) into the hopper. The machine does the rest.

Send us the outside dimensions of your work, also gauge and length of screws and we will gladly quote on your requirements.

Write us now. Every day you put it off means unnecessary expense in your shop.

No. 640 ROLLER CARRIAGE CUT-OFF SAW

This Saw is designed for rapid cutting off of light stock, and is particularly adapted for such work in the furniture, cabinet, sash, door and box factory.

It is very easily operated. The table which is 60″ x 40″ and made of well seasoned hardwood strips braced to prevent warping, is mounted on four rollers on the top of the frame. These rollers operate with the greatest ease and are arranged to hold the table square with the saw in any position.

The fence, extending the full length of the table, is fitted with a clamp to hold a stop to facilitate the cutting of the stock to any desired length.

Let us send you bulletin of this saw.
Full particulars and prices on request.

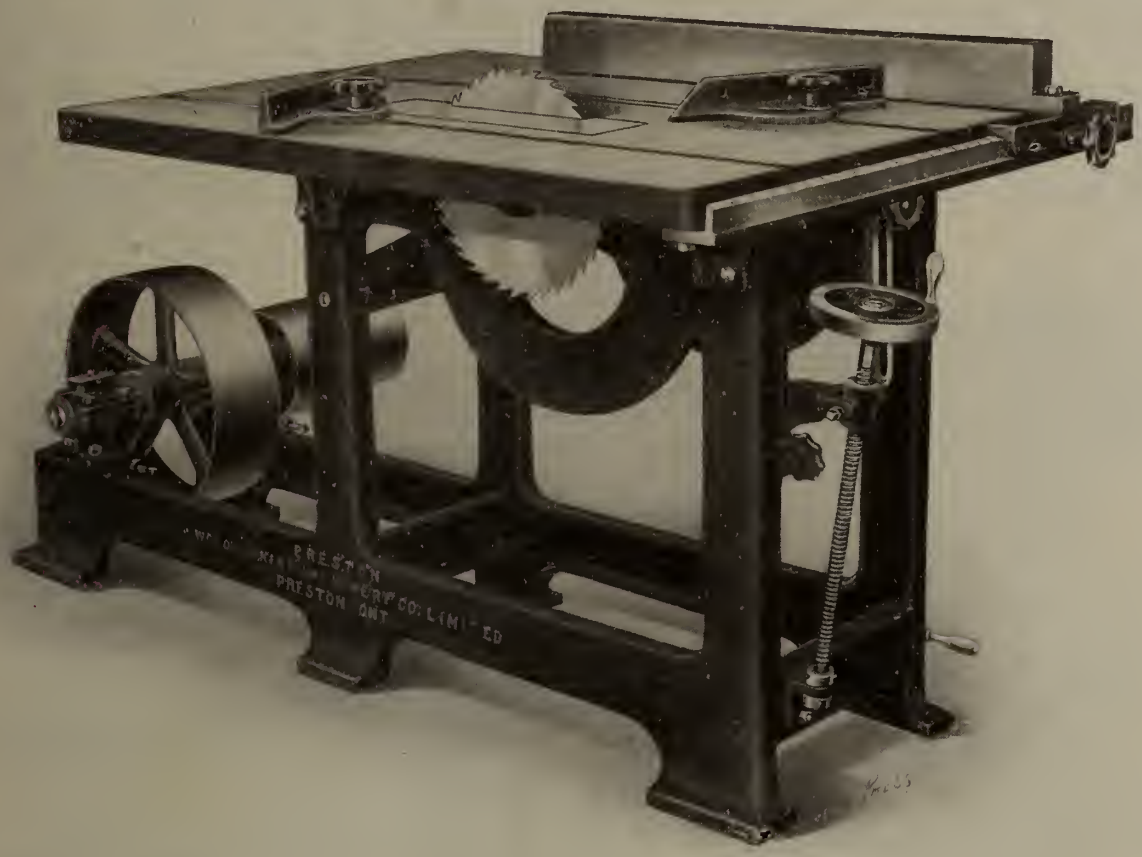
The Preston Woodworking

PRESTON

A Simple, Practical Machine
For Fine Accurate Work



No. 125.—TILTING TOP SAW TABLE

Frame Cast in One Piece. **Easy and Rapid Adjustment of Saw.**
Special Locking Device. **Belt Tightening Bushes on Countershaft.**
Arranged for Individual Motor Drive if Desired.

This Engraving represents a new Rip and Cut Off Saw Table, a medium sized machine, convenient for Dadoing, Grooving, Rabbeting, Mitreing, Bevelling, Etc. It is intended especially for fine and accurate work on Furniture, Sash and Door, Cabinet, Pattern and General Woodworking Shops. The design is simple and practical and the construction is high-class throughout.

The Frame is cast in one solid piece making it rigid and strong. The Table is planed perfectly true and has a removable wood throat plate allowing extra thick saws or Dado Heads to be used. The machine will carry saw blades up to 14" diameter.

A Boring attachment or a Boring and Mortising attachment with a wood table, can be furnished with this machine, if desired.

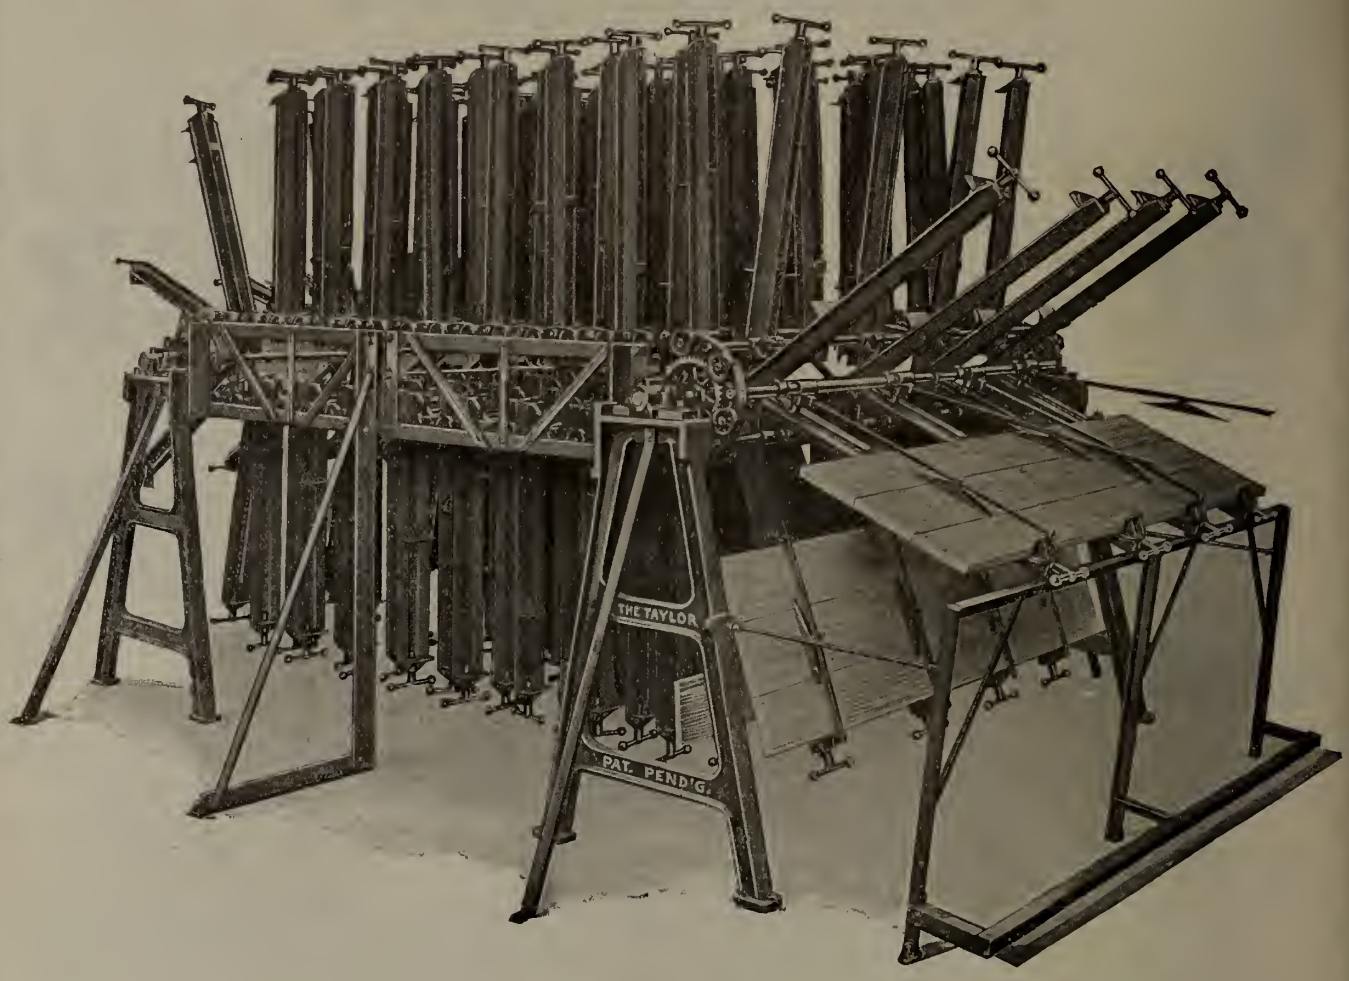
KITCHENER - CANADA

CLAMP The Taylor TRADE MARK CARRIER



Forty section machine carrying 160 clamps, measuring 8 ft. 2½ in. between shaft centers.

The clamp is one of the most interesting features of the clamp carrier. A remarkable strain can be applied with greatest ease; the work it turns out—both thick and thin stock—is 100 per cent. perfect.

An Engineering concern recently wrote:

"I am recommending Taylor clamps to the Germain Mfg. Co. because I have proven the clamps more efficient through scientific time studies on both and all existing types of gluing-up machines and devices."

As a result of the above recommendations, The Germain Mfg. Co. referred to bought two Taylor carriers. They installed them, and tested them and have since purchased two more. We can tell you numerous instances where customers are using from two to nine Taylor carriers each as a result of similar experiences.

Let us prove the truth of these claims by showing you one of these carriers in operation, or you can try the clamps out on your own work. Ask for C. C. Folder and further information.

POUGHKEEPSIE, N. Y.

EAGLESFIELD

"Beltless" Swing Saw

Adaptable to close, accurate work

The "Eaglesfield" is the result of very careful study of swing saw requirements, and is designed with a special view to economy, reliability of operation and compactness.

This saw is operated by a specially designed and rated four-horsepower motor, the transmission being direct to the saw mandrel through a set of bevel gears, both saw mandrel and motor shaft being supported in S.K.F. ball bearings.

The hanger is of unified construction to insure rigid support and eliminate vibration. A rocker coil spring is provided instead of the ordinary counter balance weight.

The motor which is mounted in, and forms part of the head, is supplied in 60 cycles, either 2 or 3 phase, and any standard voltage. Speed of motor is 3,600 R.P.M.

One circular saw, which will cut five-inch stock, is included with each machine.

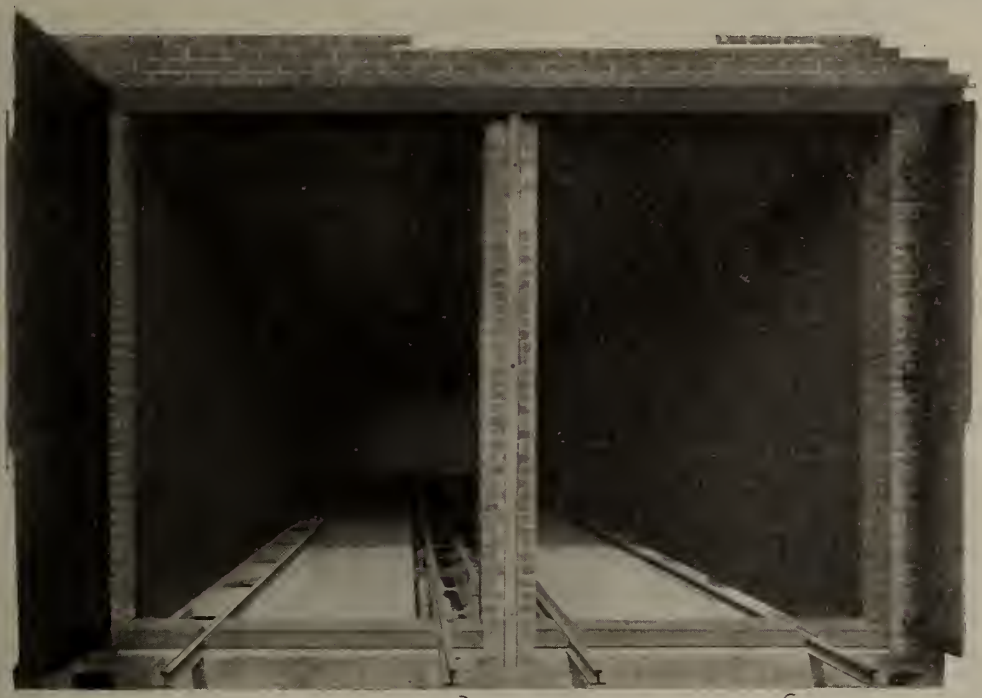
KILNS

New Principles of Lumber Drying



One Kiln Does the Work of Two

REAL ECONOMY

One Cutler Kiln does the work of two of any other make of equal size and does it better. This means that you buy but half the number of Cutler Kilns, save half the buildings, ground space, labor, handling equipment, cost of operation, supervision, and get a better quality of lumber. These are the facts which make the **Cutler System** so genuinely economical. These results are the direct effect of correct kiln design based on an accurate knowledge of the fundamental principles of drying lumber, on a thorough understanding of the mechanical features of all dry kilns and on nearly one hundred years of intensely practical experience in the drying of Lumber.

Perkins Vegetable Glue

PERKINS 183 was the FIRST VEGETABLE GLUE ever sold to high grade wood working concerns and PERKINS 183 is now the last word to be said of a HIGH GRADE, UNIFORM QUALITY, GLUE. Much money and effort have been spent on work covering a period of years; many changes were made in the formula until the present manufacturing process of 183 was reached and for fourteen years this glue has successfully filled the requirements of HIGH CLASS GLUE. Both our research and factory laboratories are constantly working to improve manufacturing methods and we shall never be satisfied to give the trade anything less than the best.

Numerous opportunities come our way to cheapen our product by making short cuts in our manufacturing process thus allowing us to sell at a lower price. We do not do this because the Trade would pay the bill first and later we would suffer in loss of trade.

SIMONDS CIRCULAR AND BAND SAWS

In every mill or woodworking shop in the land the demand for greater production is urgent. Devious methods to secure the desired results are being tried out. Some are making good—some are not. They have the manpower, but they can't get production. Many mills and woodworking shops have discovered one of the greatest hindrances to efficient operation are poor saws and knives. The saws dull easily and do not hold their tension, while the knives lose their cutting-edge quickly and this results in unsightly marks on the lumber, and consequently damage.

Inferior saws and knives are being discarded by many, and in most cases Simonds Products are replacing them. There is no question about Simonds Saws and Knives. They are made of the finest steel obtainable, hardened and tempered right and make mechanically perfect. They produce smooth lumber and cut down your operating expense.

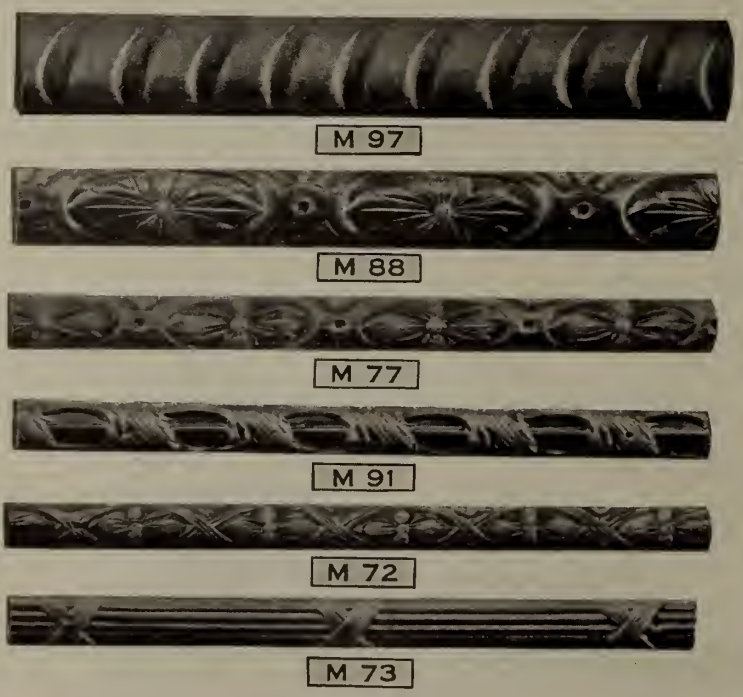
OUR MOTTO

REASONABLE PRICES – that you can afford to pay.
EFFICIENT SERVICE — that you have a right to expect
FAIR TREATMENT — that you can depend on getting

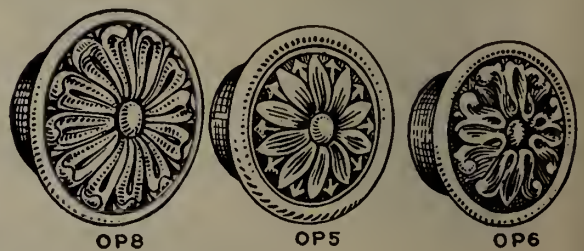
We would appreciate an opportunity of furnishing a portion of your lumber requirements.



MOULDINGS We are making more Period Mouldings than ever before. Orders should be placed early to assure your supply when needed.

KNOBS The Period Knobs we placed on the market a few months ago are proving very popular. If you have not received samples ask for them now.

ROSETTES A new Period item to accompany the knobs.



Waddell Manufacturing Company

Coldbrook and Taylor, N. W. **Grand Rapids, Mich.**

ESTABLISHED 1867 INCORPORATED 1886

OTIS MAHOGANY

Brought from the inland recesses of the tropics, from the thick matted jungles where vivid flowers, and magnificent orchids grow in riotous profusion, where monkeys chatter incessantly, and birds of beautiful plumage dwell and strange creatures cry out in the night.

These piles represent the toil of natives of the jungle, and many miles of ocean travel to the land of the white man.

Here you find

Tabasco, Laguna Honduras and Mexican Mahogany

The Otis Mills are always assured of an adequate supply. With a capacity of 12,000,000 feet per year, we are well prepared for any and all demands. Write for our prices to-day.

HARDWOOD LUMBER

Thirteen Band Mills
Six Planing Mills
Eleven Flooring Units

Annual Capacity, 130,000,000 Feet

Lumber generally is now being sold by the producer at less than the cost of production.

We have closed all our sawmills and planing mills.

Our yards are full.

Consumption of lumber is slow.

Authorities say that stocks of lumber in the hands of dealers and consumers are far below normal.

Everyone knows the extent of the arrearage in building and construction lines.

The subnormal consumptions of the past must be made up, sometime in the future by an extra or abnormal consumption.

These fundamental facts are so plain, and the deductions therefrom so obvious, that we would doubt the value of the business of any one who required to be told, the obvious thing to do under present conditions.

No one can doubt the wisdom of buying at present figures. Conditions, however, are such that consumers are and will be more exacting in respect to quality and service.

OUR LUMBER IS UNSURPASSED IN INTRINSIC QUALITY;
OUR MANUFACTURES ARE STANDARD;
OUR SERVICE IS THE SYNONYM OF EFFICIENCY.

James E. Stark & Co., Inc.
MEMPHIS, TENN.

The Big Opportunity Is Here

A High Standard of Quality and Service

TO the manufacturer, the fact that present prices are lower than production costs, should be an incentive to stock up in Hardwoods before a sudden demand arises to snatch the opportunity away.

We need only point to the market reports to emphasize that prices will **not** be lower.

For the factory trade, we are enabled to ship at short notice any quantity of **Birch, Basswood,** or **Hard Maple.**

Anticipate the upward trend—get our quotations now.

Wire us at our expense for quotations

What will conditions be a few months hence?

The re-adjustment which started in the early Fall of 1920 cut the supply of Hardwood lumber for the year at least 50 per cent.

Weather conditions have since caused a further reduction.

General prospects for business are good

The wise man will protect himself against the Hardwood shortage which is in sight.

May we protect you with some of our stock against this condition?

Your enquiries will have our careful attention and your interest will be our first consideration.

MANUFACTURERS OF

Kentucky Hardwood Lumber

We specialize in soft texture Kentucky Oak—Plain and Quarter Sawed, also in Ash, Basswood, Chestnut, Poplar, Beech.

Let us quote you on your requirements—our prices are right and we can make prompt shipments direct from our mills.

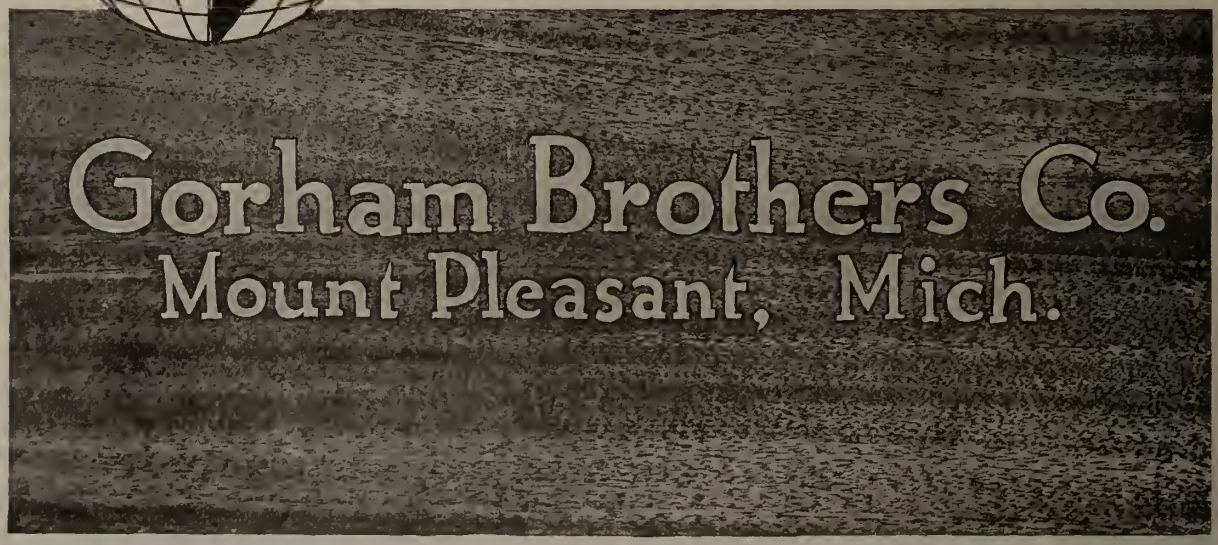
LEXINGTON - - KENTUCKY

"Gorham Quality"

built up stock

THE pride of attainment follows each piece of stock which leaves our hands, because we know that Gorham Quality serves the furniture manufacturers in an exceptional manner. Our built-up stock is the result of three generations' constant, diligent study of the problem of producing highest quality panels, desk beds and tops that will not warp, check, blister or loosen.

Gorham products will not fail you.



"Hartzell's Choice Walnut"

The way Walnut comes to us

COMING AND GOING

One constant stream of American Black Walnut from "Stump to Consumer" flowing through a steady, reliable and satisfactory channel.

"Geo. W. Hartzell"

Logs in the rough coming in Veneers and Lumber of the highest quality going out daily year in and year out covering a period of 35 years.

We rightfully claim your patronage because of "SERVICE and QUALITY," if there is any question in your mind about it

"Try Us and We Will Ship You the Convincer"

No Order too large, no Order too small to receive the close and careful attention it is our custom to give. That is a great part of our business, serving our customers.

"WRITE FOR SAMPLES AND QUOTATIONS"

Walnut is Plentiful!

AMERICAN WALNUT

"The Cabinet-wood Superlative"

Bureau Drawers That Slide

(and slide easily) after 200 years of service.

Try the drawers of an old piece of Walnut furniture—no matter how old, nor of what grade of workmanship. They slide easily—if they are Walnut. That is because Walnut doesn't shrink nor swell with the variations of temperature and humidity, and doesn't warp nor twist nor misbehave in any way—never a bit.

The supreme beauty of Walnut, in addition to the above qualities (and plus its "workability" and its "carvability"), accounts for the world-old supremacy of Walnut as a cabinet-wood—and its price permits its use in *every grade* of furniture that the careful buyer is likely to ever consider.

It will help you in your furniture buying to *know all about* American Walnut. (The furniture man will respect your discrimination, and you may be sure he will honestly give you what you want. He knows the facts—and is glad that you do.)

Don't fail to WRITE NOW for the WALNUT BOOK—edition de luxe—which will come by return mail with our compliments—and our confidence in your appreciation of it.

AMERICAN WALNUT
MANUFACTURERS' ASSOCIATION
Room 1019, 616 S. Michigan Blvd., Chicago

ALL BRANCHES OF THE FURNITURE TRADE

are feeling strongly the Effects of the series of tributes to our American Walnut which are running continuously in most of the Best Publications in America. Above is an example.

There are still a few Furniture Houses in the Country

who are giving some of their better-posted competitors a great advantage over them with the Best Trade. WHY? Simply because they "heard somebody say" that American Walnut was getting scarce. Let them ask us for THE FACTS! (See address above.)

Frank Purcell
Walnut Lumber Co.

Plenty of logs like the portion of our stock shown above have made possible the million and a half foot stock of well manufactured American Walnut Lumber which we now have to offer.

Hardwood at Pre-War Prices

There is considerable discussion and anticipation of the return of hardwood to pre-war prices. This cannot be. With freight rates 100% higher than in 1914—labor advanced 100%, and provision made for a fair margin of profit to be earned on plants erected at high costs, it is impossible to bring costs down to pre-war levels.

Present indications point to an advance in prices. Existing stocks are 60% below normal and the cut this year is estimated as being 40% below normal. Improved business conditions must lead to enlarged demand with consequent high prices.

It would be to your interests to anticipate your requirements and order now.

Chicago Mill and Lumber Company

Adds Battery of Dry Kilns

(Capacity 1,500,000 Feet of Lumber per Month)

TO

Dimension Plant at Cairo, Ill.

(Plant Equipped with Latest Machinery)

Drawer Side Material and Moulder Work.

Dimension Lumber Kiln Dried Means:

1. **The elimination of waste.**
2. **A saving of at least 40% in freight.**
3. **Lumber delivered at the woodworker's plant ready for immediate use.**
4. **A quick turnover and minimum investment in lumber.**

The benefits to be derived from the use of Chicago Mill Dimension Lumber are cumulative. In the long run it means lower production cost for the finished article.

The postal rates on periodicals having been trebled on January 1st, 1921, the subscription price of the "Canadian Woodworker" has been increased to $2.00 a year; United States and Foreign, $2.50. Current subscriptions will be continued at the former rate until expiration of the subscription year.

Costs Must be Reduced

Whether business revives next month, next summer or next fall, one fact stands out clear and that is that prices must be lowered and costs reduced.

Perhaps, it would be better to put it the other way around and state that costs must be lowered so that prices may be reduced. It would be folly to suggest that prices be cut unless production costs warrant such a move. At times, whether through force of circumstances or otherwise, a manufacturer may find it advisable to sell his product, for a limited period, at a price below replacement value. In doing so he is impairing his capital and diminishing the recuperative power of his business. Such tactics, if persisted in, can lead to but one result—one which is not pleasant to contemplate. As lower values must prevail, and that means lower manufacturing costs, one may well ask how can costs be reduced?

It is easy to suggest a number of ways in which costs might be lowered but the difficulty is to carry out such sugestions in actual practice. Such items as increasing production, curtailing overhead, reducing wages, increased efficiency of plant and employees, cheaper raw material, elimination of waste and stricter attention to buying, so that none but the most suitable materials be secured, would have a favorable effect on the cost of any product.

A closer analysis of some of these factors shows that all are not applicable under present conditions. Increased output and slackened demand do not go well together; neither do curtailed production and a decreased percentage of overhead. There are many expenditures which may be reduced, or eliminated altogether, but as the output is restricted, the general tendency is for the percentage of burden to climb.

The question of a general reduction in wages has been discussed in recent issues of the "Canadian Woodworker and Furniture Manufacturer." Wages have been lowered in some plants, in others the number of working hours have been increased, but the general attitude of the whole industry seems to be to maintain the present scales, if at all possible. This does not mean that the majority of woodworkers do not believe that ultimately lower rates will prevail but rather that any attempt at the present time to reduce costs should not be made at the expense of the workmen. Some interesting views on this subject will be found elsewhere in this issue.

When business is quiet is a good time to look into the efficiency of the factory. There is more time available and one has the advantage of being able to take a more deliberate view of the plant and its operations. It may be that the rearranging of a few machines will eliminate lost motion, reduce handling costs and result in an even flow of work from machine to machine. Again perhaps it might be advisable to lay a set of rails to the cut-off saw, rip-saw or planer so that the loaded kiln trucks may be spotted convenient to the machine operators. Tracks might also be placed in the lumber yard so that one handling would suffice to move the stock from railway car to machine room.

The productiveness of the employees is something which each individual mechanic must work out for himself. He must bear his share. If he does not think a cut in wages is justifiable, he must be made to realize that increased efficiency is the only other alternative. That the men can increase production was instanced in a certain woodworking plant where a ten per cent. reduction in staff resulted in a twenty per cent. increase in production. When another ten per cent. was laid off, production jumped another fifteen per cent.

Waste is something with which all woodworkers have to contend. It occurs in varying degrees in every plant. In the box industry they estimate that from seventeen to twenty per cent. is a fair allowance while some woodworkers figure on from thirty to forty-five per cent. The amount of waste depends on the product, the grades of lumber used, the attitude of the management and employees and the provision made for utilizing the small cuttings. Before a determined effort is likely to be made to eradicate this waste, the enormity of the loss must be realized. This can only be ascertained by close and careful checking. If one knew that forty per cent. of all stock entering the plant was lost, it is likely that drastic steps would be taken.

An analysis of manufacturing costs and a close examination of the different factors which affect the cost of production might open up the way to savings that would enable one to meet present market conditions without impairing profits or reducing wages.

Shall Wages be Reduced or Maintained?

Many Woodworkers Express Views on This Vital Question—Industry Not Unanimous—Interesting Views and Opinions From Different Centres

The article on the wage question, published in the January "Canadian Woodworker," seems to have struck a responsive chord. Prominent woodworkers in different parts of the Dominion have written outlining their views and policies. The majority of the communications received contain the intimation that the rates prevailing in different woodworking centres are none too high and should be maintained for the present at least. The belief is prevalent, however, that wages must ultimately drop to a lower level, but that present conditions do not warrant a reduction at this moment.

On the other hand, certain woodworkers have made reductions running from 5 to 20 per cent., while others have increased the number of hours from 9 to 10 without increasing the rate per day. Where the scale being paid was above the average, there is some justification for putting a lower rate into effect. The demand for lower values must be met. This can be done, to a certain extent at least, if the workmen and artisans in the various woodworking plants will settle down and work and thus increase their productiveness. Many interesting views and sidelights are to be found in the letters received.

Attitude of B. C. Manufacturers

Average rate paid. "Wages in all branches of the woodworking industry in British Columbia must come down. We are endeavoring to market our wood products at a time when the demand has fallen off and values have declined. To secure even a fair volume of business it is necessary to cut prices away down, below the cost of production in some cases. In this paring down it is only just and right that labor bear a share.

"Again we are faced with competition from American woodworking plants in which wages have been lowered. We must follow suit to be able to compete.

"The following figures will give an idea of the wages being paid in the different industries. While these may not apply to every individual plant they can be taken as a kind of basic range for the whole industry":

Box Factories

Boys, under 18 years..	.25	Planer feeder	42½
Common labor, inside.	.40	Resaw, single band	42½
Cut-off saw	42½	Resaw, twin band	45½
Cutter	42½	Ripper	42½
Outside labor, common.	42½	Tiers, boys and women.	.35

Planing Mill

Engineer	47½	Machine setter	47½
Feeders	.45	Moulding man	47½
Filer	.50	Moulding tier	42½
Foreman	Optional	Off bearers	42½
Graders behind machine	47½	Piler	42½
Resaw feeder	.45	Rip saw feeder	.45
Knife grinder	.45	Transfer man	42½

Lumber Yard

Common labor	42½	Pilers of trucks	42½
Fortman	Optional	Stackers	42½
Grader shop	.50	Switchmen	.45
Green lumber pilers (day labor)	42½	Track men and tramway men	42½
Pile bottom men	42½	Teamster, 1 horse	42½
Motormen and chauffeurs	47½	Teamster, 2 horse	45½

* * *

Lower wages in B. C., according to one manufacturer. "Wages are higher in woodworking plants in British Columbia than in the state of Washington, our near-by competitors. Therefore a reduction in wages must come. Manufacturers should, however, assure themselves that such reductions are as near as possible, in the same ratio as the drop in the cost of living.

"There must be good will and co-operation between labor and capital to bring satisfactory results. All industries in the same line, in each locality, should get together and establish a scale of wages entirely fair to labor. Lower wages will compel lower prices and lower prices will create demand and volume, and factories will take on new life; labor will be fully employed and all will be well.

"We are looking forward to 1921 to be a good year. It will surprise the pessimists."

Opinion Divided in N. B.

A St. John woodworker intimates that he is of the opinion that lower wages will certainly obtain from this time forward. "The manufacturing plants in this section have already had to reduce wages, effective as at January 1st, ranging from ten to twenty per cent. and in consequence they have been able to revise downwards the selling prices of their products. The downward march in wages will be more or less slow, but it is sure to come and with it of course must come the cost of living. Our artisan class must also be made to realize how desirable it is to cut out some of the useless and needless expenditures which have been going on during the period of high wages and the sooner conditions return back to something like normal the better it will be for both the employers and employees."

* * *

Another New Brunswick manufacturer contends that wages are now too high. "We have not made any reduction in wages and do not think it is advisable to do so, for the reason that the wages paid in the woodworking factories here are lower, we believe, than in many of the other trades. No doubt a general reduction in prices would tend to revive business, but we are hoping that with spring that the usual revival will take place."

Lower Scale in Nova Scotia

Very difficult to get universal rate, says Nova Scotian woodworker. "We have reduced our workmen 10 per cent. starting February 1st. We found it necessary to do this. All woodworking factories in the Maritime provinces are reducing wages from 10 to 20 per cent.

"I am afraid we will see very little improvement in demand for building supplies until prices are reduced. When the public sees there is a reduction being made, even if it is very slight, it will be encouraged to buy. A reduction will have to be made in all raw material, before we can get prices reduced to any considerable amount, as labor is the largest item in any line of manufactured goods.

"It is practically impossible to get a universal wage rate in the woodworking business throughout Canada. It is very hard to get an equal rate in one province. There are so many small factories being started from time to time and the price of finished products is re-

duced by them. The larger factories have to reduce their prices to meet this competition, even if they produce a better line of goods. We have always been in competition with small concerns, starting and running perhaps for a year or two and then going out of business, and I presume we always will be. This is one of the disadvantages of the woodworking business."

"May say the rates of wages we have been paying are:

37c per hour for laborers.
40c per hour for machine helpers.
45c to 60c per hour for machine men.
55c to 60c per hour for bench men.

Attitude of Furniture Industry

Ontario furniture manufacturer thinks wages should not be forced down. "The principle of attempting to force wages down is entirely wrong. Banks or the people, who are in positions to do so, are endeavoring to reduce wage scales, and thus bring things back to a normal condition, but the start should be made at the other end. Living expenses throughout the country should be standardized. Thus, each district or zone could be allotted a proportionate wage per individual for living, clothing and educational expenses. Thus, in the broadest sense of the word, we would be giving the population of Canada a chance to educate citizens who would be citizens of the highest order.

"As it is now, with the reduced wage, and the price of living still high, it is just a question of shifting the burden. These people have to live. They will go to the retailer and get credit, which will cause bad debts, which will never be collected, so, unless the retailer is simply an iron man, and absolutely refuses to give further credit, he will have to stand the biggest part of the load. If there was such a thing as establishing a standard rate of wage throughout the country, and see that every man, who is willing to work, receives that living wage, plus extra for special ability, and the man who is not willing to work, but is able to work, railroaded out of the community.

"By this, I mean that we should take the emblem of the country, the beaver, as our pattern. There are no drones allowed in the beaver colony. Of course, it is true they appoint their watchmen, who do not appear to do manual labor, and their duty is to watch. Therefore, in our present state of society, we have to have so many who do not perform manual labor, but, nevertheless, they are producers of the highest order, and are entitled to their place in society, and to receive value for their endeavors.

Must Hold Skilled Hands

"It is very hard to say just what the prevailing rate is in the furniture field. From my own experience, for a mechanic, responsible for his own work, and the work of two or three improvers, the rate is around 55s to 65c an hour. Unless we manage to keep the wages of the woodworker high enough that he can enjoy some of the comforts and educate his family equal to the fimilies of men in a similar position in other industries, we are going to lose some of the sons of the present day woodworkers, who would naturally follow in this line. They will go into other trades where they can make more money.

"Referring to the wages again. I believe some of the mechanics, who are responsible for their own work only, are receiving about 45c an hour to 55c an hour. Of course, there are so many different departments in the furniture industry, that what applies to the machine hand, who takes a large hazard with his fingers, does not apply to the cabinet-maker or to the finisher. These wages are correspondingly less."

Attitude N. S. Furniture Manufacturer

Pays same scale as other furniture men. "We note your remarks, in the January "Canadian Woodworker," regarding the present outlook in wages, and it is certainly a very difficult question to handle, as there are so many sides to it. We have been paying the same scale of wages as other manufacturers in the furniture business in Upper Canada and are not aware whether our competitors have made any reductions or not. We are of the opinion that in the majority of cases no changes have been made as yet. We do not see that wages can be or should be reduced until there is a substantial drop in the cost of living, and while there have been some slight reductions in the price of various commodities, as yet they are not large. It is possible that we will make a cut of not more than 5 per cent. in our wages at a little later date. The future to our minds depends altogether on the cost of living.

"Under present conditions there is practically nothing doing in the furniture business. It is not a question of price. Furniture cannot be sold at any price, as the dealers are simply not buying. We cannot think that this will last for any great length of time, and as retail stocks are not large, there is almost bound to be a good demand for our product within a few weeks. There is no doubt that on a falling market such as we are now experiencing, the manufacturer who pays a lower wage has the advantage, that is if he can keep his employees satisfied and get the results. However, we hope that there will not be such competition in the future as there was in the past. It was certainly hard for everyone concerned, and we think that all have seen the folly of it and will endeavor to keep the woodworking business on a stable basis."

Increases Number of Hours

"We believe that if prices and production are to reach pre-war conditions the production also must level up and other conditions must be reinstated. Our own policy for the next few months will be to resume operations on a ten hour day plan, paying the same rate for ten hours as previously paid for nine hours' work.

"There is no attempt being made, so far as we know in the Kitchener district to reduce wages and manufacturers would be very loath to have wages again so low as to detract from the industry."

Present Scale to Hold in Quebec

Depends on workmen themselves. "Our policy is not to reduce wages. We do not think that present conditions warrant such a move and we want to be fair with our employees. What we would like to see is for every workingman to buckle down and do a good day's work. If the efficiency of labor was to be restored to its former basis, it would result in lower production costs. Thus the demand for a lower level of prices could be met without touching wages. This is a problem which is largely up to labor itself. If they will not do their fair share a reduction in wages may be found to be absolutely necessary."

Will not make any change for present. "We are running a sash and door factory and employ about fifteen to twenty men. We have a good set of men and pay them a fair wage and for the present do not feel like like making any reduction. Rents are going

(Continued on page 128)

Jas. E. Ferguson, Cost Accounting Department, Woodstock, Ont., chairman, Labor Committee.

Furniture Men in Annual Conference

All Departments of Association Doing Splendid Work—Interesting Address on Prevention of Accidents—Officers For Ensuing Year

The annual meeting of the Furniture Manufacturers' Association, which was held in Toronto, February 1st and 2nd, was marked by a very satisfactory attendance, about 45 furniture manufacturers being represented. A number of interesting addresses were presented and questions of vital interest to the industry discussed. In addition, the various officials and committees were elected for the ensuing year.

F. M. Tobin, secretary of the Industrial Accident Association, gave a short address on accidents in furniture plants. Mr. Tobin touched on the various classes of accidents which occur in factories of this kind. In presenting statistics, he showed that what is known as "Class 3" under the Workmen's Compensation Act, embraces 175 furniture factories, etc., employing 15,319 hands. The number of accidents reported for this class was 655. These might be divided up as follows: Accidents caused by circular saws 117, jointers 40, shapers 28, planers 25, falling objects 64 and infection 60. He urged upon the manufacturers present the advisability of making a strong endeavor to reduce accidents and so safeguard their machines that the number of mishaps will be materially reduced during 1921.

Gratifying Support Given

This was followed by a short address by Mr. Lovett, safety inspector. Mr. Lovett enlarged on some of the remarks made by Mr. Tobin and pointed out that mechanical guards will only prevent 25 per cent. of the accidents. The other 75 must be eliminated by care on the part of the workmen. He also touched upon the necessity of insisting that every workman receive first aid, no matter how slight the injury.

As the work of the association for 1920 was covered pretty thoroughly by the address of the retiring chairman, W. J. Anderson (published elsewhere), the secretary, Wm. Cawkell, did not touch on the general features of the work for the past year. He drew attention to the fact that 57 registered meetings were held during 1920 and spoke of the gratifying attendance which was recorded at these meetings; forty-six of the members attended 5 meetings or over, a number having been present on over 25 occasions. This is most gratifying, for the success of the association depends upon the efforts of its members, and the growth and standing of the Furniture Manufacturers' Association reflects credit on each individual member. The secretary then read the financial statement which was passed.

Work of Cost Department

James E. Ferguson of the Cost Accounting Department, gave an outline of the market conditions which prevailed during 1920. The peak of commodity prices was reached early in the spring, and since then there has been a gradual decline. The prices of furniture were advanced during the year, in accordance with the increase in costs, the necessary adjustments being made from time to time. New price lists were issued recently based on present values. Touching on costs, Mr. Ferguson stated "One of the matters, which will require much attention, is the variation of costs. Compilation of records is not the chief aim in cost-accounting. The main purpose is to bring to notice excessive costs of any kind so that immediate steps can be taken to correct them. Efforts will be made to gather information regarding cost details of materials and operations, and through the study of these facts to establish standards. By this means we hope to secure greater uniformity, having in view the greatest reduc-

tion consistent with service and quality. It is believed that an intensive study of costs will lead to considerable improvement. Owing to present uncertain conditions it must be pointed out once more that there is danger in piling up stocks of manufactured goods."

The report of the Credit Committee, which was presented by James Garvie, in the absence of Mark Rowe, the chairman of the committee, reviewed the activities of this section for the past year. In closing, Mr. Rowe intimated that it can be said without fear of contradiction that no similar trade organization in Canada has anything like such an efficient credit service as is now being given to the members of this association.

Election of Officials and Committees

The officials and committees elected for the ensuing year are as follows:—

Chairman—J. H. Baetz.

Vice-chairman—Wm. Krug.

Secretary—Wm. Cawkell.

Executive Committee—W. J. Anderson, H. Ford, G. W. Gibbard, G. A. Gruetzner, W. G. Hay, J. S. Knechtel, D. E. Macintyre, L. Malcolm, J. R. Shaw, H. M. Snyder, D. M. Wright.

Labor Committee—J. E. Ferguson (chairman), G. A. Gruetzner, P. R. Hilborn, J. S. Knechtel, Wm. Krug, D. E. Macintyre, Jas. Malcolm, H. M. Snyder, D. M. Wright, A. H. Watson, W. A. Oliver, A. H. Smyth.

Credit Men's Committee—Mark Rowe (chairman), M. S. Armstrong, W. J. Fleischaeur, Jas. Garvie, R. Gomery, R. Purtle, C. G. McLellan, H. B. Shortt, L. J. Salter.

Chairmen of sections who are also members of the Advisory Board—Better Case Goods, Jas. Malcolm; Medium Case Goods, C. M. Bell; Lower Case Goods, J. E. Campbell; Office Furniture, P. R. Hilborn; Tables, W. G. Durst; Chairs, W. O. Winterholt; Upholstery, Geo. Hughes; Office Filing Devices, W. E. Dolan.

Address of Newly Elected Chairman

In taking the chair, the newly-elected chairman, J. H. Baetz, addressed the members present as follows:

"I assure you that I appreciate the honor you have conferred upon me in making me chairman of your association. I realize also that you have given me a real man's job for 1921. I am following Mr. Anderson, who has been a very good chairman, and other good men who were before him, and I have the ideals that they have set up in carrying out the work of the association, to assist me.

"I can only appeal to your loyalty to the association and to the realization of what the association has meant to you in the last five years, for continued support during 1921. Had the association not existed during the last six or eight months we all know what would have happened, and know what will happen if the association does not carry on during the next six or eight months, each one loyal to the other.

"I think the work of the association in 1921 will require that the different sections and committees meet very frequently, for the details can be worked out before presentation to the association, and in a smaller body of men, differences can be ironed out more than in a larger meeting.

"I hope also that the association's members will loyally support the Home Furnishings Bureau, which is being re-organized, and I feel that it is going to be one of the best things the association ever organized. The furniture industry in the United States is going to spend two million dollars in advertising, and if this association had done nothing more than to start something like this, the sentiment created would be worth the work done."

It was moved and seconded: "That it is the opinion of the furniture manufacturers that a turnover tax should be substituted for Dominion Profits Tax and the Sales Tax now imposed by the Dominion Government."

Wm. Cawkell, Toronto, Secretary of the Association.

It was also moved and seconded: "That a special committee be appointed to represent this association at all meetings which may be held for the purpose of furthering a Turnover Tax as a substitute for the Dominion Profits Tax and Sales Tax."

The meeting then adjourned.

Comparative Raw Material Values

The advance and decline of raw material values was outlined in a chart displayed at the meeting of the Furniture Manufacturers' Association recently held in Toronto. The figures given show percentage of increase over the prices which prevailed in 1914:

	Highest since 1914	Values prevailing Jan. 1921
Lumber	286.5%	183.7%
Hardware	137. %	104. %
Finishing	264 %	143.2%
Mirrors & glass..	257 %	156 %
Packing	210 %	169 %
All items	244.7%	166.7%

In figuring the last item, the different materials were considered in the proportions in which they are used. Thus, the latter figures represent the fluctuations in the average raw material cost of furniture.

Which is the best type of feed drive for the moulder and planer? The old fashioned cone step pulleys, or the latest variety friction feed?

Will Business Revive and How Soon?

Address by W. J. Anderson at Annual Meeting of Furniture Manufacturers' Association – Outlines Work of Organization—Prosperous Future in Store for Industry

The year just closed began under the influence of the boom created by the great war; with our factories choked with orders but with stocks depleted and raw materials scarce and very high in price. This condition prevailed throughout the early months of the new year. To meet the conditions imposed upon our industry two price advances were made, one in January and one in March. Toward the beginning

W. J. Anderson, Stratford Chair Co., Limited, Stratford, Ont.

of the month of May there was a noticeable falling off in orders and by July 1st it was evident we were entering upon a very slack summer season, as far as the furniture industry was concerned.

As there was every prospect of a bountiful harvest throughout all the provinces of the Dominion it was believed that with the harvesting of the crop, business would again revive and that the autumn months would see the stocks of furniture, that had accumulated during the slack months of summer, moving out. In this we were disappointed for as the months went by, instead of improvement in business, orders dwindled in volume, until our factories were forced to curtail production by reducing working staffs and hours of work, and finally the closing down of many factories, temporarily, during the last month of the year.

Busy Year for Association

With conditions as described it can be readily understood that it has been a busy year for our association. Many meetings of the executive of the general membership were necessary. When meetings were called, to deal with the problems that were constantly coming up, it was most encouraging to your officers to find that there was, in every case, a full and representative gathering in attendance. This fact proves that our members recognize that the association idea has brought to the industry a greater measure of strength and prosperity than it has ever before known. We are said to have the best organized industry in the Dominion. Surely then it is for us to see that we are loyal to our association and that we all co-operate for the common good and by so doing be prepared to meet the difficulties that may confront us during 1921.

Your association has been watchful of the interests of its members throughout the year. Its various committees,—Executive, Labor, Publicity, Credit and Tariff, have convened many times and have always given their best consideration to the problems presented. Notwithstanding the watchfulness of your labor committee, there was a little disturbance in labor circles. Early in April a communication was presented from Mr. Marsh, a labor organizer, accompanied by a draft of an agreement which he wished placed before the Ontario Furniture Manufacturers. Our members voted to take no action in the matter. Following this incident the Unions created trouble in three centres—Cornwall, Ottawa and Owen Sound.

The strike in Cornwall occurred in June and continued for about one week when it was settled, the men going back with some slight modification of the old terms. In Ottawa a strike occurred in July. It extended to woodworking plants in general. The manufacturers there declined to recognize the strike or claims of the strikers and the result was a victory for the employers. In Owen Sound, strikes also occurred in the month of July in several furniture plants. After running a period of about three weeks these were broken, the men going back to work on the terms offered them by their employers, before the strike was called. Following these unsuccessful attempts to force the manufacturers to recognize the demands of the union, labor seemed to settle down and during the latter part of the year the workman has been more concerned about his job continuing at present rates than about increased pay or shorter hours.

Wages Important Question

With the falling of prices of manufactured articles and reductions in the cost of living, there is a feeling abroad that labor must bear its share in the reduction. What action our industry will take in this regard is a matter for your Labor committee to consider and which will, no doubt, come before you as one of the first problems of 1921.

A new feature among the activities of the association during 1920 was the putting on of a publicity campaign which had for its object the building of a bigger market for furniture. A committee was appointed in June and given full power to proceed with the formation of the Home Furnishings Bureau. A newspaper advertising campaign started in September covering the whole of Canada. It was run in 44 Dailies, 74 Weeklies and 11 Farm Journals and continued to the first week in December. The retail

trade was generally appreciative of this advertising effort and one retailer described it as the most forward step that had ever been taken in the furniture industry in Canada.

In the month of June, when there were rumors of Luxury Tax about to be placed on furniture by the Federal Government, a delegation from the Association visited Ottawa. Several interviews were had with the Finance Minister. Your committee was able to show that furniture is not a luxury and, as you know, very few articles of furniture came under the Luxury Tax.

Owing to the broadening of our work a change of quarters was necessary about the middle of the year and which were found at our present rooms, 8 Colborne Street. Just here I would like to say a word in appreciation of our Secretary, Cost Accountant and their staffs. It has been a busy and difficult year for them. They have met every demand cheerfully and rendered loyal and efficient service in the interests of the Association.

What of 1921?

Having reviewed the events of the year, what of the future? Will business revive, and if so, how soon? As to the latter part of this question, the answer is not certain. The outlook is a little clouded but opinion is unanimously optimistic, although it is conceded that the return to normal will be slow and gradual, probably extending over the greater part of the year. The general feeling of Canadian manufacturers has a confident tone.

The demand for furniture is undoubtedly slack at the moment, but it cannot always be so. Our country, during 1920, gathered the greatest crop in its history, much of which is still in the granaries of the farmers. When this surplus grain is marketed a portion of the money will assuredly be spent in the furniture stores of the country. The retail furniture trade has been on a buying strike for practically six months and must have by this time, pretty well depleted their stocks. They ought soon to be in the market for goods.

There is a shortage of houses in every city, town and hamlet in the Dominion. With labor plentiful and wages as a result, no doubt lower, we may, with confidence, look for many new buildings to be erected this summer, which, in turn, will require new furniture. In addition it is said that there are millions of people in Europe waiting to emigrate to Canada as soon as they can get steamship accommodation. Every emigrant family will require a home and furniture.

When we consider all these factors we cannot help but be cheerful and confident concerning the outlook for the furniture industry in Canada. For a few months orders may come slowly but they will increase in volume and in due time business will again be normal. In the meantime let us exercise caution in the management of our factories. Do not let stocks accumulate. Keep labor costs and material consumption under control. Have an eye to the granting of credits. Be loyal to the principles of our association. And if we observe these things, I believe the furniture industry in Canada will successfully weather the present strain.

"Is it necessary that a foreman should be able to work any woodworking machine?" is a question often asked. He can be a good foreman without those qualifications, but he is a better one with them.

The Toy Industry of Canada

By Horace M. Sanord

Although the toy and doll industry of Canada has made considerable advance compared with pre-war times, it would appear from official statistics that the domestic demand is by no means fully met by Canadian factories, for the Dominion's imports of toys and dolls during the fiscal year 1913 amounted to $939,678 and during 1920 to $1,534,728.

The kinds of toys manufactured in Canada include animals, autos, balls, billiard games, boats, building blocks, carriages, crokinole boards, croquet sets, dishes, dolls' furniture, games, garden sets, lawn swings, pool tables, pucks, rocking horses, skipping ropes, sleighs, teeters, toy balloons, tricycles, and wheelbarrows, which are made of celluloid, enamel, iron, steel, tin, rubber, and wood. The growth of the Canadian industry is principally due to conditions arising out of the war, and at the present time some 35 toy factories are listed, although the census returns report the operation of only 15 in 1918—the latest year for which figures are available. These 15 factories represented a capital investment of $369,219 in 1918; they employed 33 salaried workers and 193 wage workers, to whom they paid, respectively $44,190 and $131,817, they used materials costing at the works $115,329, and turned out products whose selling value at the works was $405,369.

Imports and Exports of Dolls and Toys

As already stated, the Dominion required in the past year an additional $1,500,000 worth of toys to supplement the output of Canadian factories. Before the war Germany was the chief source of supply, but the United States now occupies first place, and Japan likewise has made a notable advance in its shipments of toys. The shares of the various countries sending dolls and toys to Canada in the fiscal years 1913, 1918, 1919, and 1920 were:—

	Year ending Mar. 31—			
Imported from	1913	1918	1919	1920
United States	$273,139	$785,998	$708,489	$1,136,372
United Kingdom	76,400	66,755	28,208	93,692
Austria-Hungary	6,029	.....	.....	.....
Belgium	4,239	.....	.....	.....
France	19,303	9,407	4,567	20,458
Germany	536,242	.....	.....	.....
Holland	5,205	.....	.....	.....
Japan	18,738	224,095	228,741	277,946
Other countries	383	626	2,132	6,260
Total	$939,678	$1,086,881	$972,137	$1,534,728

Last year Canada exported $139,052 worth of domestic dolls and toys, the United States taking $5,635 worth, the United Kingdom $120,322, and other countries $13,095, and re-exported $21,300 worth of foreign toys, $19,655 worth to the United States, $134 to the United Kingdom, and $1,511 to other countries.

Make Haste Slowly

Do not attempt to establish too low a level of values. If after making a reduction, prices are found to be still too high, it is an easy matter to make a further cut, but if found to be too low, it will be extremely difficult, in view of the attitude of the general public, to establish a higher level.

The day has not yet arrived when you can put the belt "on" and the machine will do the rest. You have to do your part to the machine or the results are very unsatisfactory.

An Attractive Bungalow for $3,600

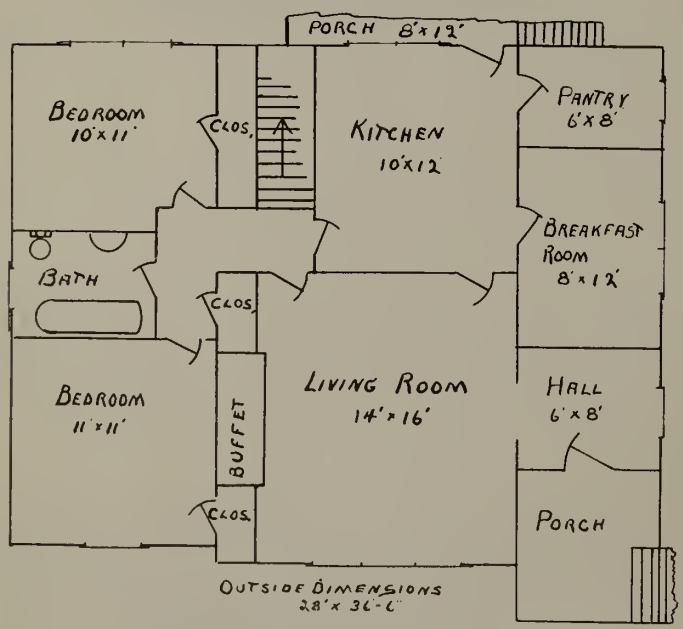
Cost Reduced by Careful Planning—Convenience and Comfort Not Overlooked — Many Desirable Built-in Features

The attractiveness of the bungalows being built under the Victoria City Housing Scheme, Victoria, B.C., may be gathered from the accompanying illustration. This home was put up for a returned soldier and represents the better type of house being erected under the above mentioned scheme. It is a conveniently planned bungalow, rather attractive in appearance, and embodies many desirable features.

The outside is finished in shingles, stained a rich warm tone, together with plastered gables. Provision is made for five rooms and bath, including a large living room with built-in buffet. In laying out the rooms, closets, etc., an effort was made to secure a maximum of comfort and convenience, coupled with the conservation and utilization of space. The reader can judge as to whether or not this objective was attained—the owners are well satisfied with the result.

The living room is particularly attractive, being nicely finished with panelled walls and convenient built-in features, including a nicely designed buffet, extending nearly the full length of one side. The buffet proper is in the centre with built-in china closets on either side. The large archway opening into the hall seems to express a warm welcome, as well as giving an impression of roominess and space. On each side of this archway are built-in cupboards with glass doors. These may be used either as bookcases or china closets. Another feature is a fine open fireplace, of pressed brick, surmounted by well-designed overmantel.

The breakfast room opening off the kitchen is a particularly pleasing feature. This is a bright, well



Layout of bungalow built at a cost of $3,600.

lighted, cheerful room, so placed as to result in the saving of many steps. Being warm and cosy, it is used with unfailing regularity.

The lighting of the whole bungalow is good. It might be suggested that an extra window in both bedrooms might be desirable, the arrangement and location of furniture must be considered and sufficient wall space provided for bed and other articles, also a door from pantry into breakfast room. Another suggestion might be to transpose breakfast room and pantry so that when a meal is served in the living

Type of house built in Victoria, B. C., under housing scheme

room the pantry is right at hand rather than in the far corner of the kitchen.

The basement, which extends the full length of the building, is finished in cement.

This bungalow was constructed by Messrs. Evans & Green of Victoria, B.C., while the plans were prepared by C. E. Watkins, architect of the same city. When completed, the cost totalled about $3600.

Plate Glass Association Makes Suggestion

Furniture manufacturers have recently received a communication from the Plate Glass Manufacturers of America, which reads as follows:

"The shortage of plate glass which has existed for the past eighteen months has been a source of embarrassment in the furniture manufacturing industry, and while the manufacturers of plate glass have exerted every possible effort to supply the demand, they have been unable to do so.

"Many millions of dollars have been invested in plant additions and enlargements, and we take pleasure in informing the furniture trade that it is the expectation of the plate glass manufacturers that the additional capacity will enable them to supply the requirements of all customers. This situation permits us to suggest that the restoration of the smaller sizes, 12, 14 and 16 inches in width, which for various reasons have for the past year been eliminated from your lines, would greatly improve the assortment of sizes which the furniture industry consumes and would be of material assistance to the manufacturers of plate glass in supplying promptly the demands of your industry.

"Yours respectfully,

"The Plate Glass Mfgs. of America."

Safety Features of Industrial Lighting

Good Lighting Means Fewer Accidents Coupled With Increased Production—High Cost of Poor Illumination—Some Pertinent Facts and Figures

By Samuel G. Hibben*

The passage of the various state and provincial codes relating to the lighting of factories and mercantile establishments brings us face to face with a new safety factor,—illumination. This is one of the least understood, yet most vital subjects that have to do with economic, humane employment and development of labor, and as our knowledge of better lighting increases, our appreciation of its influence on industrial operation increases in proportion.

In discussing industrial lighting fixture equipment and particularly its maintenance, we have entered upon an argument disclosing much that is vital in the accomplishment of all three of the desiderata of successful industrial operation, viz., production, speed, and safety. Since production depends upon the other two, or since all three are really synonomous, any arguments applying to the maintenance of a grade of illumination satisfactory for safety, will apply equally well to the others.

One may say in general that good or bad lighting depends upon two outstanding factors. Bare incandescent lamps, or unshielded glare illuminants that not only do not illuminate but cause a contraction of the pupilary opening of the eye and resultant decrease in seeing ability, form one of these factors. More or larger bare lamps only aggravate this trouble and increase the hazard,—the solution is found in the proper use of a good reflector, or a shielding fixture. The second factor is the matter of insufficient light, and this is very largely influenced by lamp renewals, reflector and lamp cleaning, and the colors of surroundings, or whatever would be involved in maintaining the original installation up to its initial efficiency. It is this very important phase of applied illuminating engineering that we will discuss.

Cause of Many Accidents

Insufficient illumination unquestionably reduces visual acuity, decreases the speed of muscular action, confuses the mind, and leads to accidents. A few figures will illustrate this point.

In the coal industry, for example, we think of a coal mine accident as resulting from falling slate or gas explosions, whereas statistics show that out of each one thousand men employed underground, there are eleven serious or fatal accidents a year, and out of the same number of employees working above ground there are five serious accidents per year. In very few industries is the illumination so wretched, either above or below ground, and this largely explains why we find the abnormally high accident rate in both places. The fire accidents that occur uninfluenced by underground hazards can be almost altogether attributed to either poor natural or poor artificial light, and doubtless more than one-third of the underground accidents arise from the same, or a greater insufficiency of light.

As another feature of the close relation between light, speed, and safety, we can cite the example of the tennis ball, which may be perfectly visible to each tennis player when held in the hand just before serving, but which when in rapid motion in the air is almost invisible, if the daylight be weak. Any rapidly moving object must register its image upon the brain before we "see" it, and as in the photography of objects, there must in human vision be sufficient illumination of that object before our eyes—our human motion picture cameras—will record a clear impression of it. Muscular action cannot begin until after our brain has "developed the film," and hence our speeding up of action, either to produce or to protect, must first start with an understanding of the time—element of vision, and an endeavor to reduce this time to a minimum, by higher lighting intensities.

What Poor Illumination Costs

Granting, for a moment, that good illumination is largely dependent upon the care of the lighting equipment, let us see what valuation may be put on poor maintenance, in other words, what is the high cost of poor light. Figures that in general agree with insurance statistics (if they err, it is upon the safe side) show that the annual total of serious accidents in industrial plants in the United States amount to 25,000 per year. That is the minimum figure. Out of this 25,000 we find 15 per cent. chargeable to poor illumination—either unshielded poorly directed light, or insufficient light. Now, based upon the average amount of employee's compensation paid, the equivalent lost time of each serious or fatal accident traceable to faulty illumination is 850 weeks, or the total annual time lost is over three million weeks, roughly equivalent to the working life times of one thousand men. If these men were earning $25.00 per week, then practically $80,000,000 in wages are lost annually, through improper lighting. If we add to this staggering sum the doctor's bills, medicines and losses of production we arrive at astonishing figures!

One does not often think about the fact that the intensities of artificial light in industrial plants are much below the daylight intensities. We find daylight in factories running from four to approximately fifty foot-candles; general artificial lighting in factories for even fine factory work has this year been in the range of 4 to 12; medium factory work between 3 and 9, and some times down to ½ or ¼ foot-candles for indoor passage-ways. Places like stairways, and the positions where accidents are the most prevalent are usually most poorly lighted and if daylight conditions here were reproduced even in the most meager way,—even if we only approximated daylight conditions we could reduce accidents materially because statistics show that the largest majority of accidents occur in the night shifts. The percentage is about two to one—two accidents under artificial lighting compared to one accident under daylight conditions.

Advantages of Better Lighting

How do the manufacturers regard good lighting? Increased production,—seventy-nine per cent. of the

manufacturers say,—is their excuse for good lighting. Decreased spoilage, seventy-one per cent. say, is their reason. Fifty-nine per cent. of the manufacturers say that fewer accidents constitute their reason for good lighting, etc. Offhand most manufacturers admit, without any argument at all, that in half of the cases they would have fewer accidents if they had better illumination.

Now it has been shown that the total cost of accidents, the total disability payments, and the total lost time of industrial operators in the United States amount to more than the total cost of artificial illumination. We should ponder over that fact! The total cost of artificial illumination in the United States is exceeded by the cost of accidents and the loss of production resulting from poor lighting, and yet fifty-nine per cent. of the manufacturers already agree that poor lighting is directly or indirectly responsible for these accidents. Surely, then, it is logical to preach the doctrine of improvement, and the folly of inertia.

Data of reputable insurance companies prove that artificial lighting is connected in some way with accidents. In one class of labor during July and August there occur out of a miximum of some ninety-five accidents, about sixty. The rate rises in October, November and December, falling off in January, February and March, as the days grow longer, and down to a minimum again in May, June and August, when daylight is a maximum.

This is not new information at all, but it adds weight to the argument that the fatal accidents or the serious accidents prevail in the darker seasons of the year. Other items, such as poor ventilation, low temperatures, etc., undoubtedly enter into these figures, but in tropical latitudes nearly this same ratio is found to exist. Similarly, the majority of the accidents that do occur in the dark seasons occur when the daylight is insufficient.

Painting For Greater Production

Now, it can be shown how maintenance is responsible for good light, and conversely what poor light we will get when we do not consider maintenance. The first thing to do to get good illumination and to reduce the danger of the industrial accidents is to look to the interior finish of the rooms or the factories, in which we operate. This is termed "Painting for Light." In other words, we say that ordinary white paint has a reflection value of 82 per cent., etc. Consider the ceiling of a room that is finished in gray-white and with a reflecting value of about 75 per cent., then three-quarters of the light falling on the ceiling surface will be reflected. Now, if we were to neglect that fact, and were to paint our walls and ceiling medium gray, for instance, which would reflect 40 per cent. of the light, we have cut our available usable illumination practically in half. Done in the red and dark colors we get reflection coefficients that range in value to about 30 per cent. Hence one of the first things that will lead up to better illumination and fewer accidents will be the attention given to the interior finishes of the buildings.

Cleaning is essential in maintaining lighting efficiency. If a typical reflector that has been in service several weeks be wiped, its candlepower in a downward direction is increased from 1,000 to approximately 1.350, with corresponding increases in other directions. If we go a step further and thoroughly wash the unit with soapy water and ammonia, its downward light is increased to about 1,500 candlepower. Obviously a neglected lighting fixture cannot properly perform its work, and the ones that show dirt are in many cases preferable to those that do not, for they will probably be cleaned oftener.

Comparing the depreciation of illumination in the office with that in the factory, we note that the factory units suffer more. This is reasonable because we find more dust and usually an oily dust in the atmosphere of the factory. In a very dirty building, after three weeks of neglect, the illumination may drop from 4.0 to 2.0 foot-candles, and the only reason why such depreciation is allowed to continue is because the reduction is so gradual and the effects are so insidious.

If we assume or admit that cleaning of lighting fixtures and of light-reflecting surroundings is essential to efficiency, then why don't we clean? Is the cost prohibitive? It cannot be considered so, in comparison to the results secured. In a typical large building having glass lighting reflectors and rather elaborate commercial fixtures, we find that out of a total annual operating cost of lighting equipment amounting to $14,438, the cleaning and maintenance is represented by $4,633, or about 32 per cent., which may be taken as a fair proportion.

Expressed in the terms of an evaluation of the working man and his possible output, the cost of good lighting is perhaps one-tenth to one-quarter of one per cent. If we can add to the workman's output, or eliminate lost time represented by not more than two minutes per day, then the value of his output in that short length of time will equal his share of the cost of lighting for the entire day. Expenditures for oil are sometimes greater than for light—are we then evaluating the machine higher than the man?

How Better Results Were Secured

In order to show what could be done with a neglected lighting installation, three factories were taken which had conditions that are found all too frequently. Case 1 was found with 2.6 foot-candles of average illumination intensity. Washing the units increased this illumination 37 per cent. to 3.6 foot-candles. Replacing old lamp bulbs with new lamps of the correct voltage-rating produced another increase of about equal amount while finally a re-painting of the interior resulted in a final intensity of over 7 foot-candles, all without increasing the power consumption in the slightest. Cases 2 and 3 of this same experiment showed similar gains that resulted from intelligent maintenance, all adding weight of testimony to the fact that it pays to clean.

Probably the greatest safety slogan is the old railway crossing sign, "Stop, Look, and Listen!" If the factory is well lighted the employees may look without stopping!

DO YOU WANT SUCCESS?

Are you willing to pay the price?
How much discouragement can you stand.
How much bruising can you take?
How long can you hold on in the face of obstacles.
Have you the grit to attempt what others have failed to do?
Can you go up against skepticism, ridicule, friendly advice to quit, without flinching?
Are you strong on the finish as well quick on the start?
Success is sold in the open market. Any man can buy it who will pay the open price.

Have You Ever Considered Dimension Stock?

That is Material Cut to Sizes and Lengths That Would Enable You To Work It Up With a Minimum of Waste and Labor

By Wm. A. Babbitt

A practical, scientific effort to eliminate all waste possible in wood using industries is part of the program of the recently formed Association of Wood Using Industries. In this endeavor they should have the hearty co-operation of every member of the woodworking industry. The proper utilization of all lumber would not only result in conserving our rapidly diminishing forests but should assist all woodworkers in keeping the cost of their products within reasonable limits.

A brief preliminary survey of this problem developed certain outstanding incontestable facts, most of which are familiar to woodworkers.

1. The estimates of the Forest Service show that if only the economies of lumber which can easily be expected from the Conservation policy of the Association could be secured the present supplies of timber can be made permanently sufficient for the needs of the industry.

2. Under present conditions of progressive depletion of timber reserves, there has developed a corresponding factor of waste, also progressively increasing in amount, owing to the decreasing quality of lumber produced.

3. Practically all hard woods, and a large proportion of soft woods are utilized in the form of dimension, and not as plank lumber. But nevertheless, the enormously wasteful process of securing the necessary dimension for the manufacture of the products of the wood using industries, by first manufacturing plank, and then manufacturing dimension from plank, is everywhere almost universal.

4. Furthermore, the production of net dimension has never been a practical commercial proposition, except in a very limited way. There are numerous reasons for this condition, but no excuse. The fault is both with the producer and equally with the consumer. Neither party appreciated the fact that net clear dimension is worth more to produce and worth more to buy than the best grades of commercial lumber. Consequently, we have had careless and shiftless manufacturing and grading of dimension on the one hand, and an ignorant and suspicious buying policy on the other hand.

5. This situation persists in spite of the high cost of all lumber, aggravated by high rail costs. A series of studies covering over two years seems to establish thoroughly the fact that the economies and other advantages of the production and use of dimension stock are still not utilized because there are no official standardized lists for dimension, covering the requirements of the Wood Using Industries; and consequently no established market for dimension. The hazard is too great for the manufacturer of dimension. Having no great market, a cancellation means practically the total loss of the dimension he has manufactured. The hazard is too great for the user of dimension stock. If he contracts for his raw materials in the form of dimension stock and the contract is thrown up, then he has no place to replenish his stocks.

6. In addition, there are contributary causes due to the heritage of practices which were established when conditions were different. Formerly, low cost of lumber and cheap freights made it convenient to ignore these questions which are now so pressing. Once there was a time, quite recently, when we were able to buy very high grade stuff without difficulty. Now the trees that were passed up in those days are the staple of the lumber market.

No doubt all these reasons were at one time decisive. But not any more. Cheap lumber is gone. High grade lumber is increasingly scarce. Low freight rates belong to the regretted past. Moreover, manufacturers of wood products as well as manufacturers of lumber have come to understand better the utility of properly manufactured dimension stock. One great lumber association is conducting a wide spread propaganda among its members along this line.

After a careful consideration of this subject, the Association of Wood Using Industries has decided to undertake the task of standardizing the principal elements of the dimension requirements of the manufacturer of wood products, in order that the economies of properly manufactured dimension stock may be secured to the mutual advantage of all concerned.

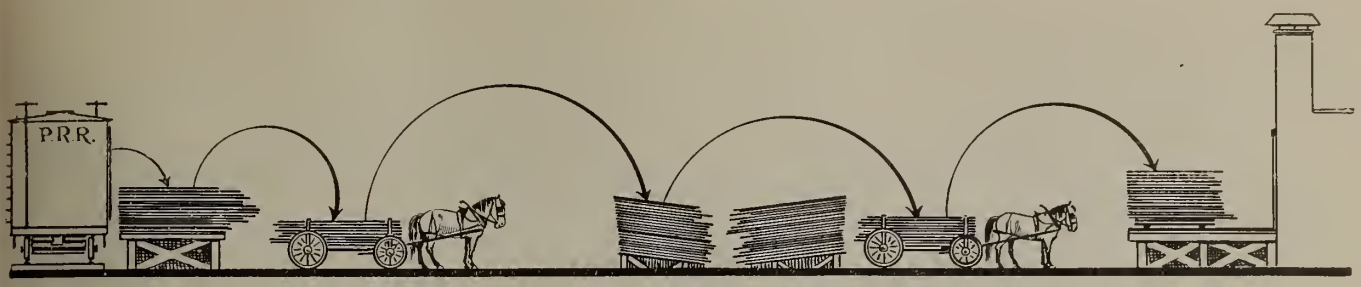
This decision has been reached not only with a full appreciation of the advantages to be secured, but also with an equally full appreciation of the difficulties in the way. It is evident that this great adventure in conserving our forest resources, with profit to the men who do the conserving, can be successful only with full and frank co-operation of all parties at interest. Nor is it to be expected that these results can be quickly secured. It is a task of years, but worth the undertaking.

The execution of the enterprise has been placed in the hands of Mr. Wm. A. Babbitt of South Bend, Ind., Chairman of the Standardization Committee. Mr. Babbitt is General Secretary of the National Association of Wood Turners, and has conducted very extensive investigations regarding the whole problem of dimension stock.

U. S. Duty on Beech and Maple

For some time the American customs officials have been classing maple as a cabinet wood and collecting a duty of 10 per cent. on all such wood imported from Canada. The board of general appraisers at Washington, D.C., recently ruled that maple be held free of duty. It is anticipated that the Treasury Department will protest this ruling. In the meantime the 10 per cent. is being collected and should the new ruling be upheld the amounts paid, since the maple was declared to be free of duty, will be refunded upon filing a claim. In this connection the Treasury Department have decided that "beech" should be classed as a cabinet wood and will in future impose a 10 per cent. levy on all shipments from Canada.

The latest application of an electric motor is one put on the shaft of a vertical boring machine. This runs at 3,450 revolutions per minute.



How Unproductive Labor May be Reduced

Placing Lumber Yard on Wheels Not Only Lessens Handling Costs but Reduces Seasoning and Handling Losses—Lumber Lift for Breaking-out Room and Mill

By C. A. Fields

The biggest problem to consider in the planning of a new up-to-date woodworking plant or the reorganizing of an old plant upon a more efficient basis, is the elimination of non-essential labor and the reduction of waste material to a minimum. In this article we shall discuss only the merits of a well systemized yard, trackage and facilities for the proper handling of lumber from car to the cutting room. Many Canadian manufacturers have installed such systems while others have the matter under serious consideration.

We must start first with the lumber yard, because here begin the ills of a poorly laid-out plant. The location of the yard switch is a very important matter and one that often demands quite a little ingenuity, especially so in a small plant where the one switch handles both the incoming raw materials and the out going finished products, since the shipping department is usually at the opposite end of the factory from where the raw materials enter. In this case it is usualy more practical to locate the tracks along one side of the factory, giving access to both the receiving and shipping departments. Where the size of the plant requires a special switch in the lumber yard, then it is usually best to put this to the extreme rear. However, the location of switch trackage is one that depends to quite an extent upon local conditions, and can not be placed always in the most convenient spot.

Unnecessary Labor Expended

There are a number of disadvantages to cope with in the old yard system of taking lumber from the box cars, and with wagons or conveyors transport it to some desirable part of the yard and here stick it for air drying, then after a few months the carefully piled stock is again loaded on wagons and removed to the dry kiln platform and here loaded on to the kiln trucks. Quite often the system of handling after it comes from the kiln, is just as cumbersome. The largest item of loss, in such a system, is the heavy expense of rehandling the lumber, which runs anywhere from one to three dollars per thousand and has been known to even exceed this cost. The accompanying diagram shows five distinct operations in getting the lumber from the car to the kilns, this is not overdrawn. Many superintendents or factory managers do not stop to consider that this work could be accomplished in one operation with a very small initial cost.

Another loss, occurring under such a system, is the deterioration of lumber through season checks, warping, sun casehardening, etc., and the loss and breakage due to frequent handling. Still another item of disadvantage, and one not to be overlooked, is the fact that a large capital is necessarily tied up in stock that is not moving toward production, thus retarding a quick turn-over of the company's investment.

A better method is handling direct to kiln trucks. This can be accomplished by laying green storage tracks parallel or at right angle to the railway switch These should be of a length to hold at least as many trucks as the kiln. Not a few firms put a trackage system throughout the entire storage yard and eliminate the piling system altogether. Such a system must have a number of transfer tracks so as to give flexibility, permitting of moving stock from any part of the green storage to any one of the dry kilns. In extremely large plants, where a million feet of lumber is a small item, electrically driven transfer cars are used for this purpose.

Importance of Proper Layout

The dry kiln layout is the next step to be considered and is the most important, for the dry kiln is, as it were, the gateway to the factory. The layout of course is not so important as the functioning of the kilns themselves, for they are responsible for the success of one of the most important phases of commercial wood manufacturing. The success of the drying operation is determined by the right type of kiln for that particular line of work and the part played by the kiln operator in directing this initial process of manufacturing. Volumes could be written on this subject but we shall dwell only on the kiln layout. The most logical layout is to build the kilns at the end of the green storage tracks and if possible with a transfer system between the two. Whether the kilns are to be opened at both ends is to be determined by the type of kiln used and should be decided by a dry kiln engineer. In case they are opened at both the receiving and discharging ends it facilitates the moving of the trucks by having another transfer system at the discharge end, with the dry storage on the opposite side. The size of dry storage shed should be the same capacity as the dry kilns. Quite often we find the dry storage along the side of the kilns, whch is not a bad arrangement where there are only a few kilns, but it is not feasible in conjunction with a large battery. The most important thing is to "have" a storage shed and if possible, situated so as

to be easily accessible from the kilns and to the cutting room. This permits the stock to progress from green storage to kilns, from kilns to dry storage and then to cutting room.

Lumber Lift for Greater Production

The tracks running into the cutting room will terminate at the cut-off saw, rip-saws or planers, as the case may be. In many of the modern woodworking plants lumber lifts are employed to lower the kiln trucks so that the saw or planer operator works from the top of the truck, on a level with his table. This eliminates the expense of one or two men employed in repiling, which normally soon amounts to the initial cost of the lift. These can be arranged so that one lift will accommodate two machines. The writer has not noticed any of these devices in use in Canada but has seen them used successfully by such firms as:

Ford Motor Co., River Rouge Plant, Detroit
Briggs Manufacturing Co., Detroit.
St. Louis Manufacturing Co., St. Louis, Mo.
Home Furniture Co., York, Pa.
Seiling Furniture Co., Railroad, Pa.
Ebert Furniture Co., Red Lion, Pa.

The sketch at the bottom of this article is only one of the many ways in which lumber handling can be systemized. It makes no difference how your yard lies, whether square or triangular, a storage system can be so designed as to meet your particular needs.

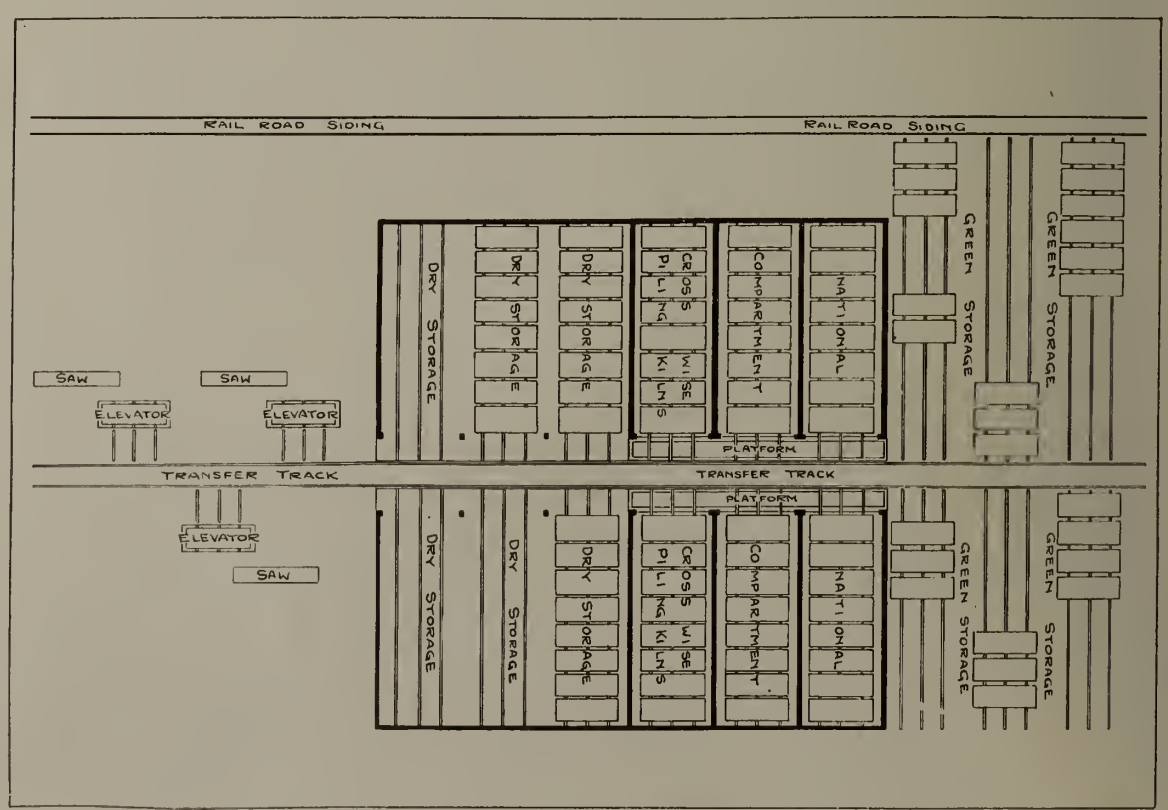
With such a system, different kinds and thicknesses of lumber can be kept on separate tracks. No matter what your drying schedule may call for, your kiln operator can move any specified stock. You can always get your oldest lumber into kiln without trouble. A large surplus air drying stock is not necessary. This enables a quick turn-over in investments and lessens the risk of a large stock on hand and a declining market. Such a system is a paying proposition any way you look at it. Some firms have realized as much as a thirty-five per cent. saving in one year. This may be a little high for an average but a pencil and paper and a little sound thinking on the part of the manufacturer will enable him to approximately figure out the solution to his own lumber handling problems.

Ascertaining Moisture in Staves

A large American user of wood staves has rather a novel way of determining the moisture content of the cooperage stock as it arrives. This manufacturer produces a line of corn syrups and requires an especially tight barrel. Considerable trouble has been experienced at times owing to the fact that the staves were not sufficiently dry. Now when a carload of staves is received, a number of samples are taken at random from different places in the car and tested as follows: A hole is bored in the centre of the stave (boring in the centre does not injure the pieces as it can be used as a bung stave) and the shavings placed in a broad-mouthed cork stoppered bottle, being sure that the borings are not subjected to air or sun. Each individual lot of shavings is then weighed and placed in a small warming oven which is maintained at a temperature of 212 deg. for six hours. They are then removed and weighed again and the difference noted.

In actual practice the container is weighed with the shavings. For example, the weight of dish 15.75 grams; the weight of dish and shavings 25.75 grams; the weight of dish and shavings after drying 23.13 grams; difference 1.62 grams, or 6.2 per cent. moisture.

This manufacturer believes that if every stave and heading concern were to adopt a similar method of testing staves for moisture content, it would mean a big boost for the wooden barrel industry as satisfied users are the best advertisements for any product.



Showing how lumber yard may be placed on wheels, effecting big saving.

Simplified System for Keeping Mechanics Time

H. T. Diderch Suggests Development of Cost-Keeping System Described in January "Canadian Woodworker"—Accurate Yet Simple Method of Keeping Time

In commenting on the article on planing mill costs which appeared on page 83 of the January "Canadian Woodworker," H. T. Diderch, of the Millwork Cost Information Bureau, Chicago, suggests that on form "D," there is, apparently, no division between factory or manufacturing cost and total cost, which represents factory cost plus the addition for selling, warehousing and general administrative expense. Without a distinction between the two costs, a manufacturer has no means of knowing whether it is more profitable to manufacture a given article, or to buy it on the outside and simply act as a jobber. If you will refer to the article, "Are You Applying Burden Properly?" which was published on page 87 of the December "Canadian Woodworker," you will find additional reasons for setting up what we term a "commercial burden."

The time ticket shown as form "B," is also open to criticism for the reason that it requires the workman to perform too much clerical labor and, again, it is not conducive to accurate reporting of time. The workman is not required to be as specific as he might be if form "A," shown in the accompanying illustration was provided. With this type of time ticket, the workman's writing is confined to entering his number and the number of the orders on which he works. It is also based on calculating all elapsed time in intervals of six minutes, which, because they represent tenths of an hour will produce closer results than if th workman is obliged merely to enter 3½ hours, 1 hour, ½ hour, etc. If a workman is allowed to compute the elapsed time himself, the tendency is always to break on full or half hours, and usually the time he marks down is more of a guess than anything else.

These tickets are the same on either side except that on one side the time runs from 7 to 12.30 while on the reverse side it runs from 12.30 to 6. Each department, such as machine, bench, finishing, etc., would have its own ticket. This tends to avoid confusion. Each workman uses one card a day.

In actual practice it works out as follows: Say workman 171 gets his time card in the morning and puts down his own number opposite "Employee." At 7.00 he starts on Order 417. This number he puts down in the "Order No." column opposite 7 o'clock. At 7.48 he starts on Order 1819 and marks the card accordingly. The machine breaks down at 8.18 and the workman marks, say "x15" or whatever the number is representing the proper ledger account for machine repairs. At 8.54 the necessary repairs are completed and work is resumed on Order 1819. He starts on Order 1283 at 10.12 and quits for lunch at 12.00 marking as "X." After the noon hour he turns over the card, puts his own number opposite "Employee," and since he did not complete Order 1283 in the morning, enters this number opposite starting time or 1 o'clock. He is still working on this same order at quitting time, so he puts down an "X" at 6 o'clock and turns in his card.

After the time card has been turned in, the timekeeper or cost man fills in the "Date" and the "Rate" and starts figuring the card. The rate in this case is $.30 wages per hour. To the right of the order number is a column of calculating numbers from "O" to "55." These numbers represent tenths of hours. On the morning side 12.30 is used as "O" and 7.00 as "55." while on the afternoon side 6.00 represents the "O" and 12.30 the "55." This gives 55 tenths hours—5½ hours—between 7.00 and 12.30 or between 12.30 and 6.00.

To the right of Order 417 is the calculating number "55" and of the first 1819 is "47." To get the elapsed time between 7.00 and 7.48, the timekeeper deducts 47 from 55, giving 8 tenths hours. In like manner 42 from 47 gives 5 tenths hours. These tenths are put down in the column marked "Hours." After the time

is computed it is reduced to dollars and cents by multiplying by the "Rate" and the result in the "Amount" column.

These final amounts are passed to an assembly sheet and from that to the cost cards or whatever form

Convenient time keeping form. Original 12 inches long. Illustration shows front of machine ticket and reverse side of bench tickets.

may be used for tabulating and summarizing the completed costs. It will be seen that the use of a time ticket of this general type not only simplifies the keeping of his time by the mechanic but lessens the work in the cost and time-keeping departments.

Let This be a Lesson

Ian Inman recently met with an accident in a plant in St. Thomas, Ont., which might have had a fatal termination. In some way his sleeve was caught in a setscrew of a rapidly revolving shaft. He was whirled around, his clothes completely torn off and thrown on top of a saw. The only thing that saved him was the fact that the saw was adequately protected with an efficient guard. This serves to illustrate the wisdom of having all saws and similar pieces of equipment provided with suitable guards, also the folly of running shafting or other moving parts from which such set screws are allowed to project.

Attempt to Stimulate Building

A Home Building Exposition is to be held in the Board of Trade Buildings, Winnipeg, from March 28 to April 2. More than 100 firms dealing in builders' supplies and home furnishings will put on exhibits.

To encourage attendance at the show, each adult visitor will receive a coupon which will give him or her a chance to obtain free, for the moving away, a model cottage, thoroughly and fully equipped and valued at about $3,500. This model cottage will be one of the features of the exposition. It will be 22 x 40 and will be complete except for the foundation. It will include strictly model rooms, special care being given to equipping the kitchen.

Among the dealers who will exhibit, are, lumber concerns, sash and door factories, electrical goods merchants, plumbers, hardware men, dealers in heating equipment, paint and glass firms and furniture dealers. The Winnipeg Paint Club will put on a special demonstration.

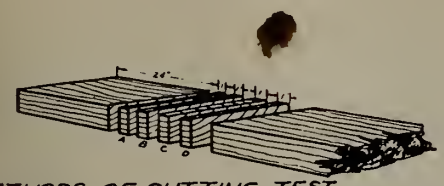
The following have been appointed on the various committees: Harry Agnew, chairman of the general committee. Chairman of the various sub-committees were appointed as follows: Building plans committee, Fred Lamar; bungalow committee, R. J. Crawford; building loans and finance committee, H. T. Hazleton; booths committee, M. McInnes; display committee, L. C. Stephens; educationl, D. B. Sprague; floor, A. J. Taylor; home sites, E. J. Ransom; publicity, John Davidson; transportation, W. E. Milner.

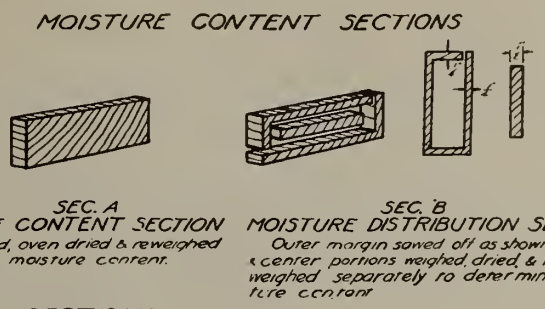
H. H. Lincoln, with offices at 706 Confederation Life Building, is secretary and manager of the exposition.

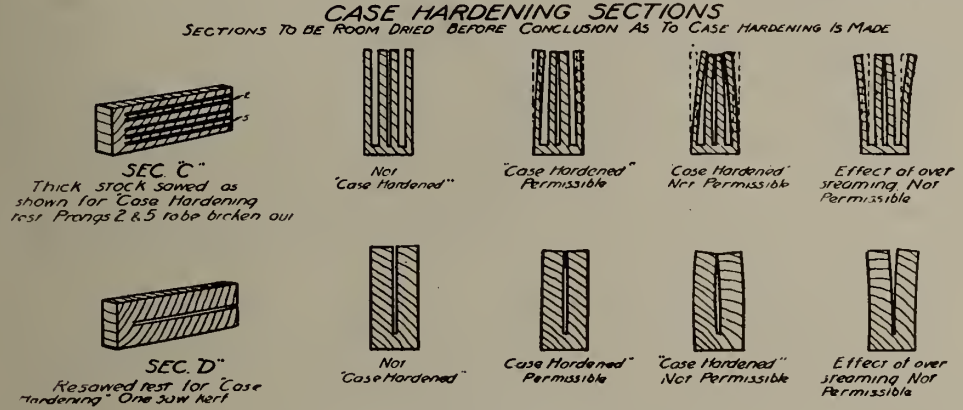
Is Production Being Encouraged?

A phase of the present economic situation which appears to be more or less neglected is the relation which is being maintained between production and consumption of commodities and manufactured articles. Declines in some lines of raw products have been so severe that it is claimed prices are now considerably below the cost of porduction while the same is claimed for some manufactured goods. The natural result of this will be that production will fall off and has already done so in some lines, with a consequent reduction in the supplies available. While there has been little said about this side of the matter as yet, statements have been made by various parties at different times that a shortage of goods would be the effect of the buyers' strike if continued too long. Taking a hint from these expressed opinions some buyers came into the market at the right time and got bargains. Others who are holding out may be the losers thereby.

Whether there is great activity or not in business there is always a certain volume of goods being absorbed and unless production is sufficient to make this good and prepare for the normal demand when it comes there is likely to be embarrassment later on. Moderate buying would appear to be a necessity if healthy conditions are to be maintained in this regard. If production does not receive sufficient encouragement a "producers' strike" is liable to result and with it there may be a scramble for goods which will undo a large part of the work of deflation which has been done.—Bradstreet's.







Tests which indicate condition of lumber.

How to Tell When Lumber is Ready to Take from Kiln

The two things which a dry kiln operator must be able to prove at the end of a kiln run are that his lumber is as dry as is required and that it is free from invisible seasoning stresses which would cause warping when the wood is resawed and shaped into furniture or other products. Neither of these points can be proved by examination of the outside of the lumber. They are easily determined, however, by the following tests which have been devised by the U. S. Forest Products Laboratory, Madison, Wisconsin: Before the lumber is removed from the kiln, choose a fairly representative board from each truck load of stock. Cut four 1-inch cross-sections (A, B, C, D) from the board at least 2 feet from the end.

Use section A to find the average moisture content of the dried stock. To do this, weigh the section immediately after cutting, on a balance accurate to 1/10 of 1 per cent., and then dry it on a steam pipe or in an oven at 212 deg. F. until it reaches constant weight. The weight lost during this drying is the weight of the moisture which was in the section. Divide the weight of the moisture by the weight of the oven-dry section and multiply by 100. This will give the percentage of moisture in the section and also in the stock in that part of the kiln from which the sample was taken. For furniture manufacture and other high grade uses, the moisture content of any board in the kiln should not vary by more than 2 or 3 per cent. from the final moisture content specified.

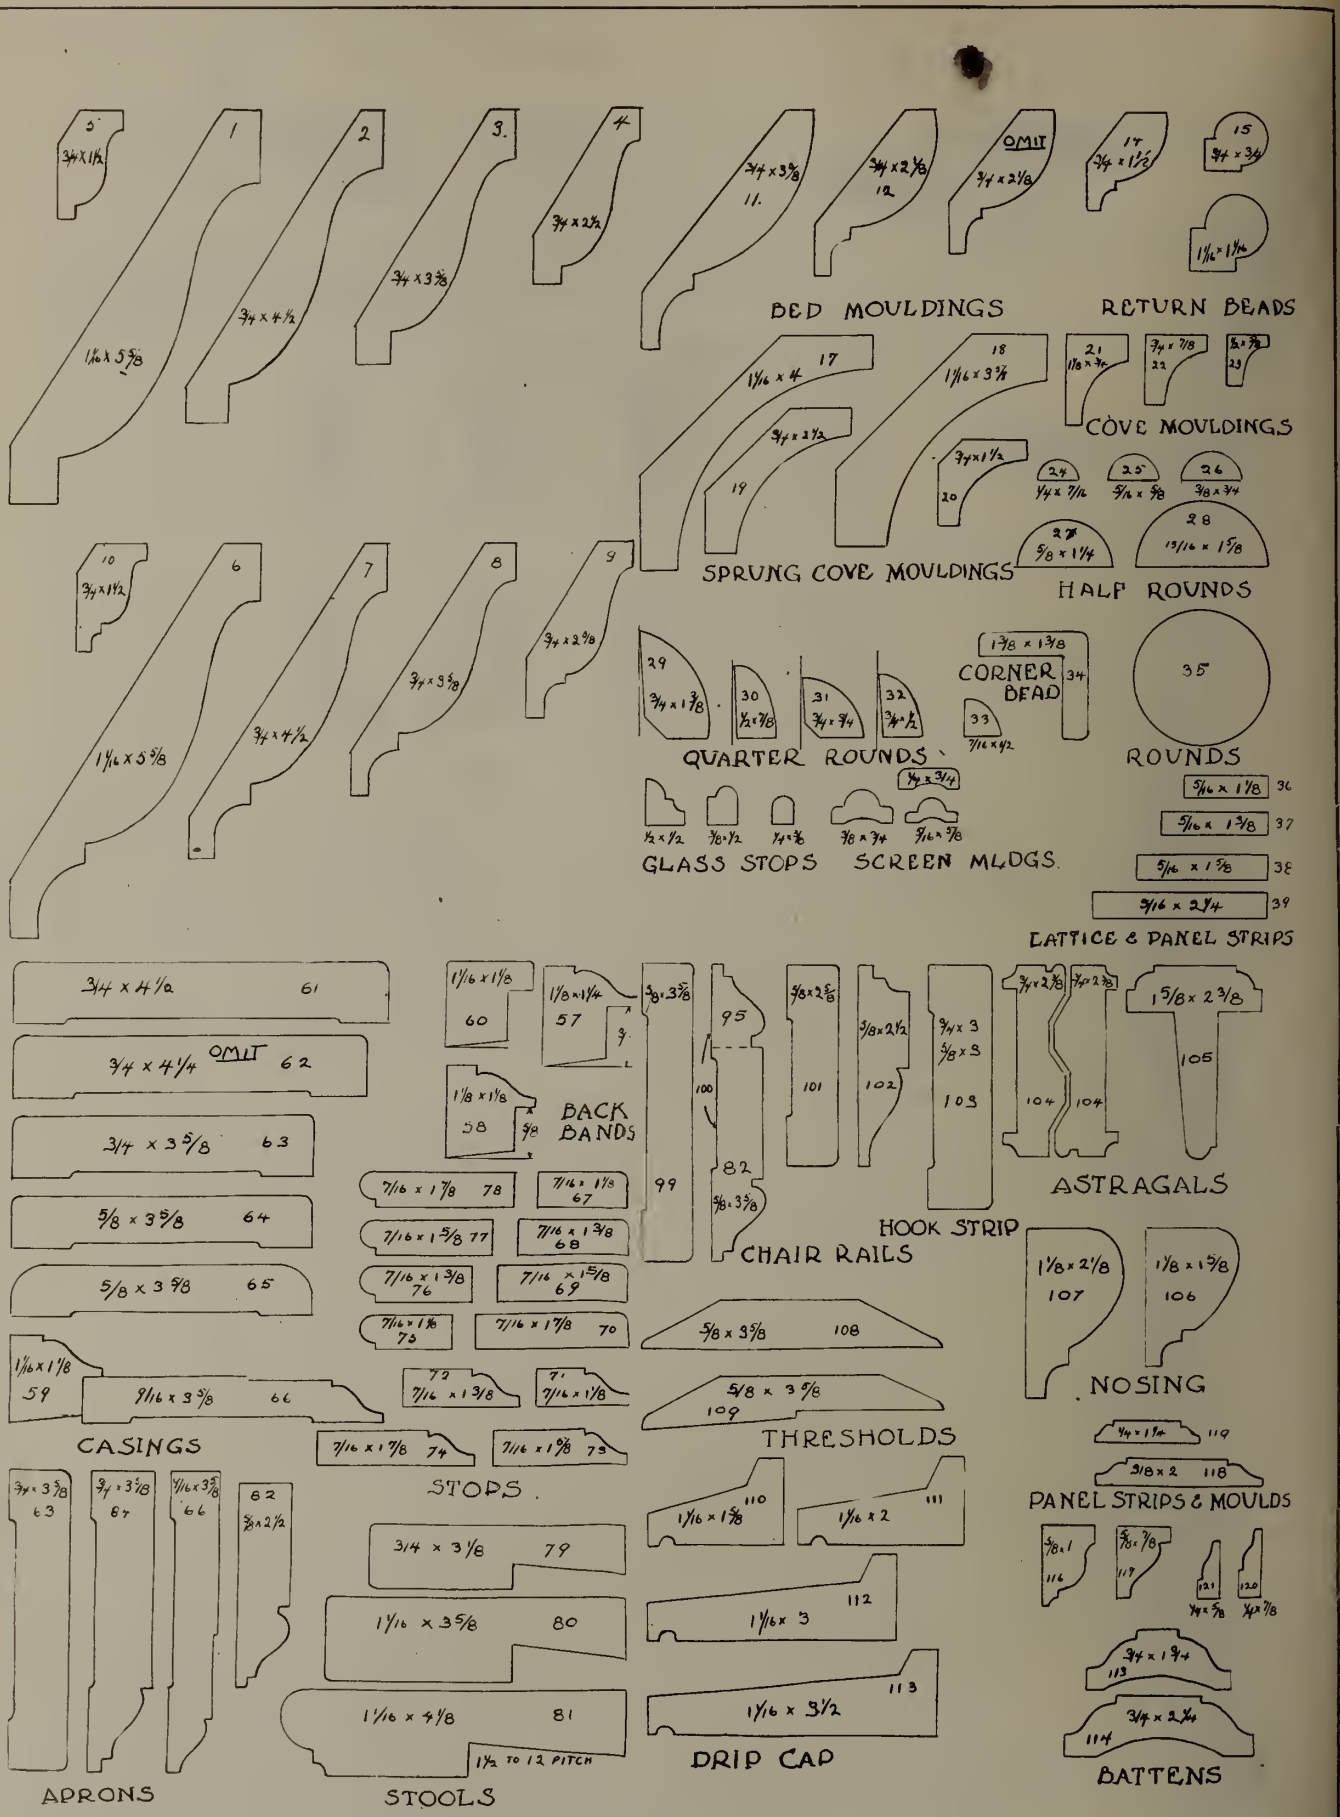
Use section B to find out whether the stock is uniformly dry from centre to outside. In order to do this the section must be cut apart and the moisture content of the inside and outside found separately. If the stock is 1½ inches or more in thickness, cut the section parallel to its edges to get an outer shell of material ¼ inch thick. Trim the remaining block equally on all four sides to leave a core ½ inch thick. If the stock is less than 1½ inches thick, cut section B so as to get an outer shell and inner core each 1/5 the total thickness of the section. Find the moisture content of each piece by the method used for finding the moisture of section A.

The moisture content of the inside and outside of the stock should be equalized, by steaming if necessary, to within 2 per cent. before the lumber leaves the kiln.

The third and fourth sections, C and D, are for casehardening and moisture distribution tests. Saw section C parallel to the wide faces of the original board to form tongues or prongs, leaving about ½ inch of solid wood at one end of the section. If the stock is less than 2 inches thick, make 5 saw cuts. From sections having 6 prongs break out the second prong from each side, leaving two outer and two central prongs. From sections having only 3 prongs remove the centre prong. In section D saw one central saw kerf to form two prongs. Stand the sections on end in some convenient place in the shop to dry.

Observe carefully the action of the prongs from the moment of sawing. Do they bow in or out or remain straight on the saw? Do they change shape after room drying? If the prongs remain straight both on the saw and after room drying, the lumber is perfectly seasoned, being free from stresses and uniformly dry throughout. If the prongs remain straight on the saw but turn in after room drying, the moisture distribution is uneven, the surface being drier than the inside. A short steaming treatment to balance the moisture content should relieve all stresses.

If the prongs turn in on the saw and do not turn out after room drying, the lumber is "casehardened" and is drier outside than inside. Use a steaming or high humidity treatment to moisten and soften the surface. The shrinkage of the outside in redrying should relieve the interior tension, and cause the stresses to disappear.



Sizes and designs as suggested by committee on standardization.

Standardization of Moulding Designs

Representative Committee Select Series of Designs—What is Purpose of Moulding —Elements of Good Design—A Very Important Question

By J. R. Wier

The question of uniform sizes and designs for mouldings and interior trim, which have been engaging the attention of thoughtful woodworkers, seems to be in a fair way of being solved. A committee, consisting of woodworkers, builders, retailers and architects, representing various associations, met recently in Chicago, under the auspices of the National Lumber Manufacturers' Association, and tackled this problem from all angles. While this was merely an advisory committee, without authority to officially adopt any designs or sizes on which they might decide, it is probable that there recommendation will be accepted and carried out by the different associations and firms represented.

In adopting standard designs it was essential that the theory and purpose of mouldings be thoroughly understood so that an intelligent choice or selection might be made. Mouldings are designed primarily to obtain or give lines, shadows and graduations of shadows. Fillets, like the conjunctions "and" and "but," are used to separate certain sections of a pattern. In no case should a fillet be large nor should the underside, the soffite, exceed the vertical face, furthermore no curved moulding is complete without a fillet.

What Constitutes Good Design

The difference between commonplace mouldings and fine mouldings is just the difference between the Roman and the Greek mouldings. The Roman mouldings have sections which are parts of circles; the Greek parts of eclipses, parabolas and hyperbolas (Parabolas are curves produced by planes cutting a cone parallel to its sides; hyperbolas are curves produced by planes cutting the cone parallel to its vertical axis). Parts of circles are of use for large beads and tori. Stock mouldings are as a rule composed of commonplace sections of circles.

In a moulding made up of a compound curve, such as the ogee, one or the other of the curves should dominate, either the concave or convex factor. Bevels are not to be considered as mouldings but should be used as chamfers only. All combinations of mouldings are based upon alterations of concave and convex sections, one or the other of which should be dominant in the combination. These curved sections may be separated from each other by one or all of the following factors, vertical flat surfaces or facias, small beads and fillets, or small fillets.

Finished Sizes Carefully Considered

In working out a set of what might be termed standard designs, every consideration was given to the contour and details of the mouldings, in many instances the curves being redesigned to conform to the best practice. The size was not overlooked for it we recognized that standard patterns should be of such a size that they may be manufactured economically from stock or standard material. Thus the sizes finally decided on were those that would work to best advantage, with a minimum of waste from standard material. In working out a design for a moulding, it must be worked out with every consideration to height and thickness. The thickness should be restricted for it must be possible to carry out the curves in proper proportion, not forgetting to omit the use of the compass unless rounds and half rounds are being made.

In deciding on the number and shape of the mouldings recommended, various catalogues and moulding books were checked. In the majority of books now in force there are some 275 to 325 patterns shown. These have been reduced to 160 and it is thought that this reduced assortment will fill all requirements of the building and contracting field.

Groove in Drip Cap Essential

During the discussion on the various mouldings it was suggested that the half round groove in the underside of the drip cap be eliminated. E. S. Hall, an architect, objected, stating that his profession considers the groove to be essential as it keeps the water from running back on the wall and prevents the face of a building from being defaced by such drip. In addition, the dirt is liable to collect and if there is no groove, the water will run back and wash the dirt down the face of the building, making those unsightly stains so often seen on some buildings. With this groove, the water drops and does not run back.

The standardization of moulding designs and sizes, together with the elimination of obsolete and little-called-for designs and odd-sized mouldings, is very desirable from the standpoint of the woodworker and sash and door manufacturer. If such a move were coupled with the adoption of uniform door and window openings, it would still be better for the industry. Special mouldings, special frames, sash and doors of odd sizes, are expensive to make and all add to the cost of building.

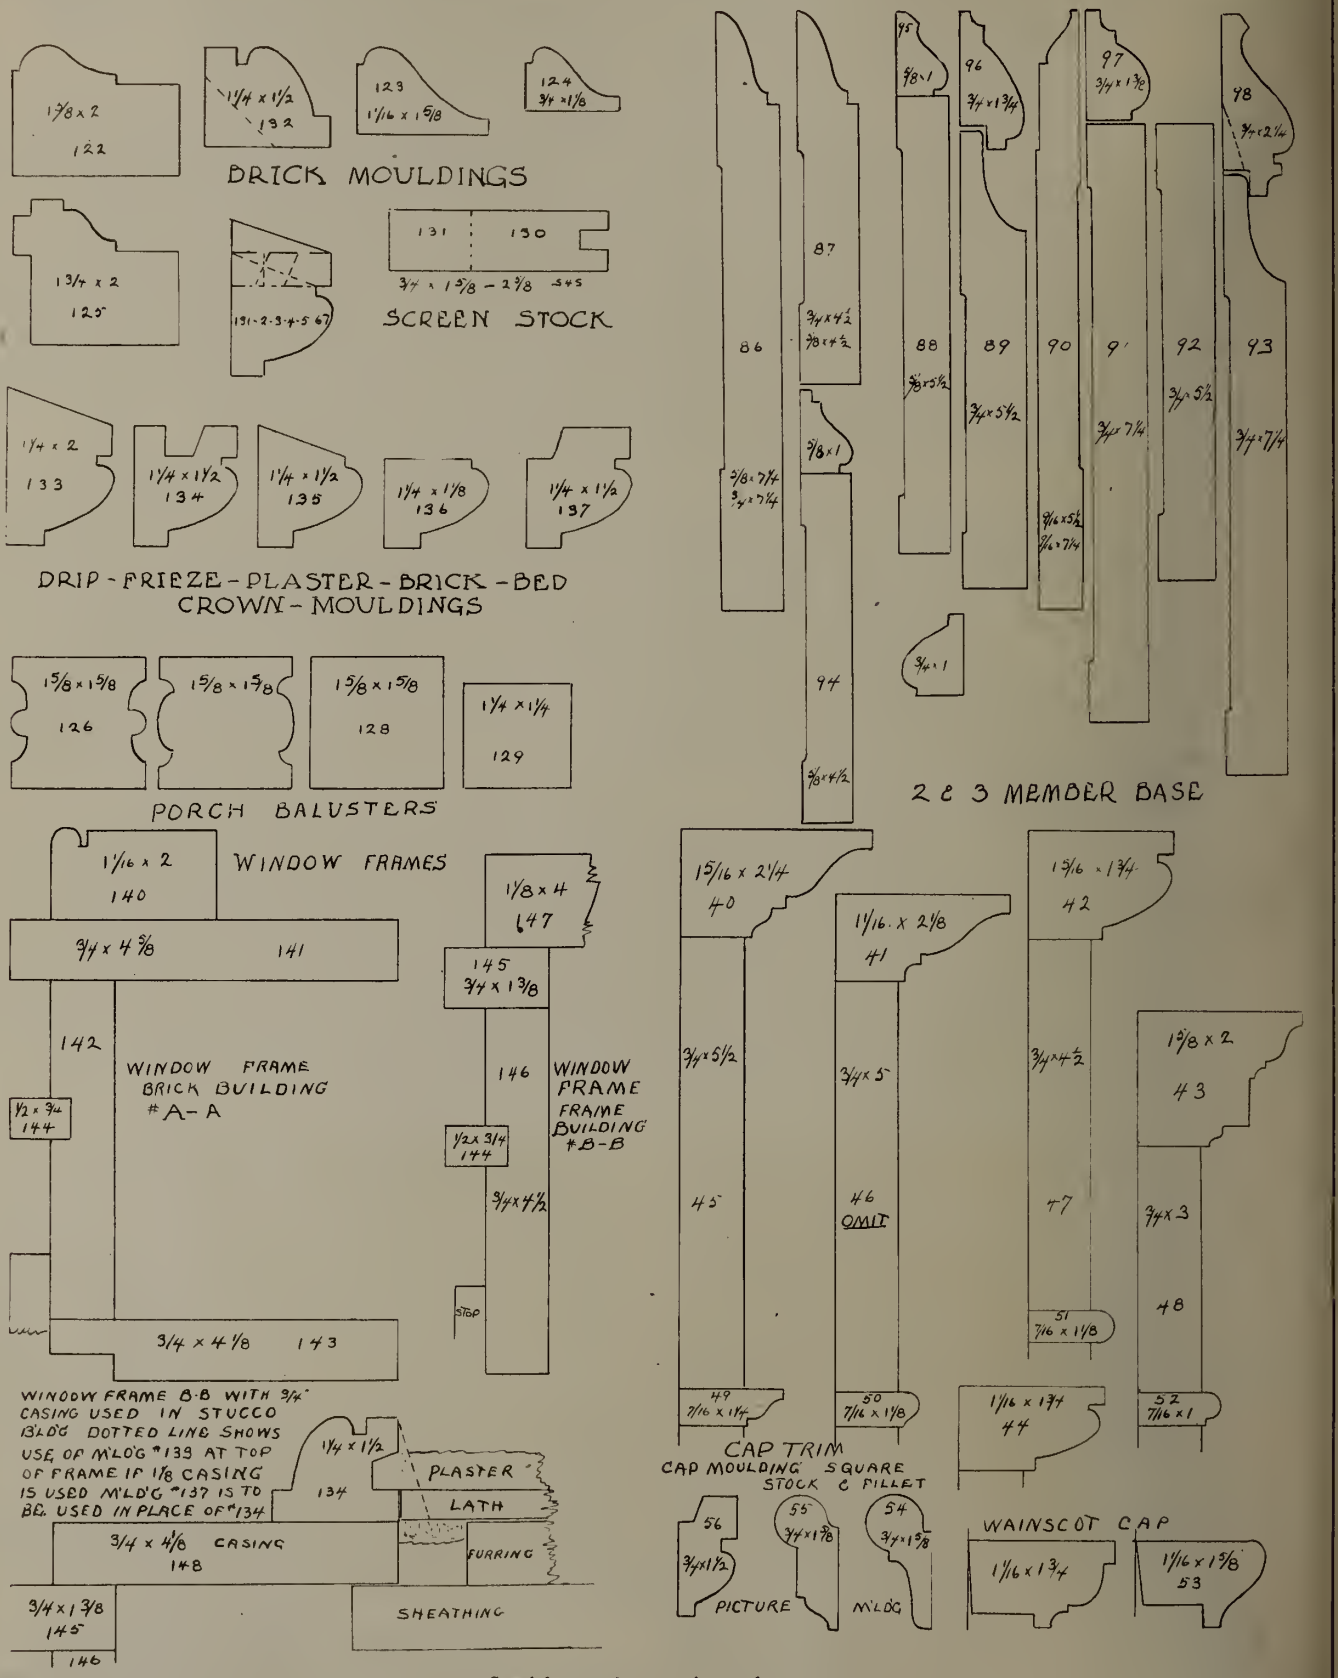
Real Benefit to Industry

A reduction in building costs, one that would assist in stimulating construction and thus help re-establish the woodworking industry on a stable, active basis, could be brought about by adopting a uniform set of moulding designs, uniform door and window openings, and the cutting and assembling of frames, interior trim, etc., at the factories. If this were done, a builder would be able to call for trim for so many windows and doors of a standard size. It could be cut in the factory, and the heads, etc., assembled, with a minimum of waste, and put in place in the building with a small expenditure of time and money.

The accompanying illustrations show some of the standard mouldings as recommended by the advisory committee. This will be followed by another series in the March "Canadian Woodworker."

This Island a Paint Factory

Mullet Island, a tiny volcanic formation protruding from the Salton Sea, has been discovered to be a natural paint factory. An apparently endless supply of material which is used as paint is taken from a small crater.



Special attention to size and contour.

How Long-Bell Manufacture Sash and Doors

Grades of Stock Based on Cutting Values—Sized Dimension Material Stored in Warehouse and Issued on Requisition—Careful Inspection to Insure Perfect Product

By H. J. Barrington

In the manufacture of doors, produced from California White Pine only, we use the grades suitable from a standpoint of cutting values as well as for softness and beautiful white appearance and figure. The lowest grade worked is No. 3 Shop. This grade produces only a limited amount of door cuttings and is used largely in the production of sash, for which it is specially selected. The cuts which are not suitable for door or sash cuttings are usually put into box shooks for the California fruit trade, and the shorter cuts put into base and plinch blocks, or core blocks for the hardwood veneer doors produced in our eastern plant.

Our next grade worked is No. 2 Shop, which usually produces 33½ per cent to 40 per cent in door cuttings of a combined grade of No. 1 and No. 2. In working this stock our main cuts are doors and the balance of the plank is put into sash or box cuttings, as in the case of No. 3 Shop. No. 1 Shop is usually the highest grade put into sash and doors and while we have occasionally used higher grades such as No. 3 Clear, or No. 1 and 2 Clear, from a standpoint of cost we cannot afford to do so on account of the market value of the plank.

The No. 1 Shop produces 50 per cent to 70 per cent of door cuttings combined grades of No. 1 and No. 2. The balance of plank is put into sash cuttings, box cuttings, base and plinth blocks, factory lath, moulding or core blocks.

The grading of shop lumber requires years of experience and that is our first consideration in the sash and door operation. The shop lumber of a type suitable for a sash and door operation is only produced from the larger logs as our small logs usually run strongly to the commons. The sawyer must use the best judgment in turning his log so as to produce the shop grades in suitable thickness and widths. Narrow widths of shop lumber are not at all times suitable owing to large amount of waste in ripping and care must be taken to produce the widths that are most suitable. This applies not only to the sawyer but to the edgerman as well—as a good piece of shop lumber 16 inches wide ripped to two pieces 8 inches wide may mean considerable loss in cutting values. For this reason we give considerable attention to shop lumber as well as all other grades from the time the log reaches the sawyer until the finished product is put into cars.

All lumber produced in the sawmill is carried out onto a sorting table and shops are here graded according to cutting values and loaded on trucks to the dry kilns.

The lumber used in door manufacture must all be kiln dried. It must also be dried properly to prevent warped and twisted stock, which is not suitable for doors and naturally means a loss to the operation. Shop lumber is kiln dried in from seven days to two weks, depending on thickness. The lumber is run out on tracks from the kilns on kiln trucks to the unloader where it is again graded and sorted ready for the sash and door operation. Thicknesses are confined to 1-inch, 1¼-inch, 1½-inch and 2-inch.

In our cutting department we use two surfacers for the planing of shop lumber for sash and door pur-

Unloads a kiln car in 12 minutes. Equipment used in Long-Bell plant.

poses. To produce the best door from a standpoint of manufacture the surfacing of shop lumber requires constant attention, as rough milling or tearing of grain means a loss in grade and values. For this work we use one 30-inch Berlin surfacer, and one 30-inch Woods surfacer. Each machine has one operator and an off-bearer and lumber is loaded on factory trucks for the next operation, ripping.

Shop lumber, strictly speaking, is a factory lumber intended for cutting up purposes and unlike most other grades it is graded according to percentages of door cuttings it will produce and not according to defects. The kind, size, or number of knots in a plank does not affect the grade so long as they are so placed as to leave certain percentages of door cuttings of given widths and lengths. For this reason it is very important that the men employed in ripping and cutting shop lumber be capable graders as well as expert cutters.

Getting the Most From Stock

Our machines for the ripping of this stock are Berlin band ripsaws, and the five machines have an expert ripper for each. The ripsaws have a specially constructed saw guide whereby it is possible to rip to any standard door width or sash width without making any adjustment for each width. The ripsawyer turns each board in its turn, and rips them to one or more pieces of widths which in his opinion will give the best return in door cuttings and values. Stile rips are naturally given first consideration as they carry the highest values, being the longest cuts. The rest, in their turn as to cutting values are long panels, cross panels, bottom rails, lock rails, top rails, long munts, short panels, and short munts. Rippings that are too narrow for doors are used for sash or mouldings, depending on grade and width.

Each ripsaw has an off-bearer and the rippings are placed at the various cutting tables located behind the machines. Lumber is distributed among the cut-off tables according to widths, as from the standpoint of economical handling as well as proficiency in cutting, the best results are secured where a cutter handles only one width.

Money Saved or Lost

For the cutting of shop lumber we use twelve specially constructed cut-off tables, each of which has a lever patent stop. These stops are so arranged that it is possible for the cutter to cut any length from the shortest box cutting to the longest stile cut used in the operation. The cutter of shop lumber must use quick judgment as time is an important factor in the cutting operation, but nevertheless, it is highly important that full values be produced from each plank as well as to keep the waste down to the minimum. A poor cutter may cut up a plank with very little waste and at the same time lose dollars in cutting values.

The cuts as produced are distributed by the off-bearers on factory trucks according to lengths, widths and grades of sash and door cuttings or box cuttings and as rapidly as trucks are filled up the door cuttings are taken to the cut stock warehouse.

To reduce the cost of manufacture, sash rips are very often produced in double widths and the cuts are taken to rip saws for re-ripping to proper stock sizes.

For the re-working of box parts we have two single Mershon resaws, one twin Mershon resaw and two California cleat machines, and all box parts are ripped, resawn and bundled in standard sizes before going to the shook warehouse.

Panel stock is resawn and taken to pony planers for surfacing. This is also true of any rough milled stock that develops in a day's cutting. For the purpose we use one Berlin and one Whitney pony planer.

Large Quantity of Material

The average daily capacity of the cutting department is about 75,000 feet and there are about 125 men employed. The final grade on all sash and door cutting is made in the cut stock warehouse. A close inspection is made there of all stocks coming from the cutting department and after being passed on, the stock is distributed to the piles according to size and grade. Any stock which does not pass inspection is returned to cutting department for reworking.

Door stock is taken from the cut-stock warehouse in quantities, sizes and grades to meet the daily requirements. An individual order covers each operation, whether it be for stock doors or a special order for a customer and an exact number of pieces of stiles, rails and panels are taken to the door department to meet the requirements. These are in their turn taken to the stile borers, rail borers, tenoners, stickers, jointers, shapers, dowel and glue machines, before being finally assembled at the put-up benches. For the work we have two double end tenoners, one single end tenoner, three large stickers, two small stickers, two stile borers, two rail borers, four sanders, one jointer, one shaper, and three glue machines.

After each operation the stock is passed on for any defective work that may develop.

Assembling and Final Inspection

Panels are sanded and then taken to the panel raisers. The final grade is made here before they are taken to the put-up benches. We have four put-up benches, each of which is handled by two men, and the parts after being properly assembled are driven together with a rubber mallet. Doors are passed to the clamp operator, who in turn clamps the door so that all parts fit snugly in their proper place. This operation is completed by sponging the glue off the face of the door, after which the door is allowed to set for twenty-four hours to give the glue sufficient time to harden.

The final operation is completed next day when the doors are sanded. This being the last inspection before warehousing, each door is carefully passed on as it comes through the sander for any defective manufacture or poor grading. Defective doors are taken to the bench-room for repairs. Sash doors, requiring stops, specially cut-in lights, or stool and water table are also taken there for the final work, after which they are taken to the door warehouse.

Should there be any doors passed on during the door operation either as to grade and manufacture, or any defective doors develop in warehouse either through rough handling or opening of joints and warped panels, they must again pass inspection at the cars at time of loading. Each door is handled separately and passed by two men before going into the stacks in the car.

Different Proceedure on Sash

The sash department is different from the door department, due to the fact that we do not carry any stock windows. Each order is handled separately according to the sticking and opening sizes. Demand

for windows varies in different parts of the country in sizes of stiles, and rails, and in our operation we make California sizes, Western sizes, New York sizes, Philadelphia sizes, Ohio sizes, Baltimore and Richmond sizes, and othes too numerous to mention. To reduce costs we bunch the runs of any particular opening and sticking but each order is handled separately for stiles, top rails, check rails and bottom rails. Stock is taken from the cutstock warehouse in quantity to fit each order and in its turn goes to the tenoners, stickers, mortisers, stabbers, relishers, and sanders, before being completed. Each operation in its turn requires care in machining and close inspection so that the various parts will go together properly.

The final operation is at the clamps where the window is put together and pinned with a metal dowel after which it is sanded and packed for warehousing and shipment.

In our sash operation we use two double end tenoners, one single end tenoner, five sash stickers, three chain mortisers, two stabbers, two relishers, one cleat machine, four clamps and three sanders.

The average production is about two hundred windows per hour, or an average yearly production of 500,000. During the twelve years' operation of this department they have produced some six million windows, which in actual lumber, not including waste, would amount to forty-five million feet.

The door department's average production is two hundred and fifty per hour or an average yearly production of 550,000 doors. During the thirteen years of the door operation this department had produced more than six and a half million doors, which required about one hundred and fifty million feet of cut stock.

Strict Attention to Shipping

Last but not least in the door and sash operation is the warehousing and loading. Considerable study has been given to this branch of the business as it is very important that doors arrive at final destination in first class condition. After giving every attention to manufacturing, careless loading may cause heavy losses after goods leave the plant.

Every car loaded is carefully inspected as to suitability for sash and door loading. Cars are swept clean and properly sawdusted.

To guard against nails and dirt, the doors are piled on two pieces of 2x4 the full length of the car. Each stack of doors has an end brace of 2x4s and the sides of the cars carry two pieces of the same material as protection against nails working out while car is in transit and thus damaging doors. All top doors on each stack are covered with red or grey resin paper as protection against dirt or cinders. The center or doorway of each car is braced sufficiently to stand the handling across the continent. Paper is nailed over the car doors on sides or ends of car to prevent dirt and cinders working through. With this done a car is ready for the market.

To Handle Hardwood Lumber Line

A. K. Johnson, of the wholesale lumber firm of J. P. Johnson & Sons, Toronto, who is well-known to the lumber and wood-working trade from several years' experience both in the yards and on the road, has been appointed Ontario representative of the Mowbray & Robinson Co., Inc., of Cincinnati, Ohio, manufacturers of hardwood lumber and flooring. The company specialize in oak, poplar, mahogany, beech, etc.

Mr. Johnson spent several days recently at the mills of the company familiarizing himself with their operations, and will call upon the lumber trade and wood-working industries of Ontario in their interests. He succeeds M. E. Cummings of Buffalo, as Canadian representative. J. J. Linehan of Cincinnati, sales manager of the company, was in Toronto recently, and

A. K. Johnson, Toronto, Canadian representative of Mowbray & Robinson Co., Inc., Cincinnati, Ohio.

met a number of members of the trade. Chas. Johnson, who is an uncle of A. K. Johnson and brother of J. P. Johnson, is manager of the company's interests in Rochester and surrounding territory. The appointment of A. K. Johnson should prove a popular and successful one for the Mowbray & Robinson Co., as he has many friends in the wood-using industry.

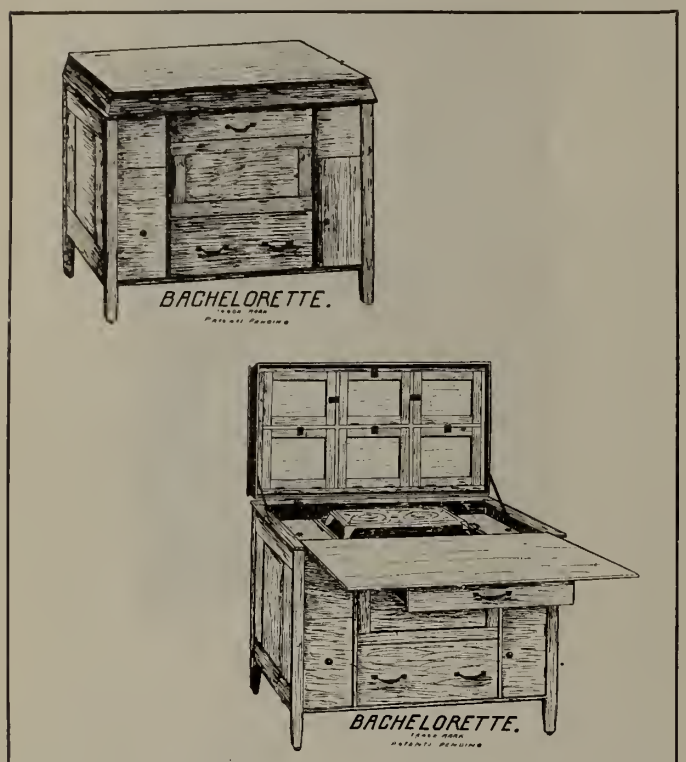
Mahogany Flooring Now on the Market

Mahogany flooring is a new commodity in this country. Undoubtedly the public will have to be educated to its use. It is now being marketed in the New York Metropolitan district by The Indiana Quartered Oak Company of Long Island City, large producers and importers of Philippine mahogany. Already several carloads of flooring cut from plain and quartered-sawed mahogany have been reported sold. This flooring is being worked from one-inch boards, thirty inches wide, being turned out in stock 13/16 x 2½ inches. It has been bringing $260 per thousand feet wholesale, a price which for some time was cheaper than quartered oak flooring, but the latter has dropped. The mahogany flooring is very attractive in appearance, and there are possibilities of its becoming a staple commodity in this market, particularly if other hardwoods hold up in price to any way near where they now are.

Combines Utility and Attractiveness

A new piece of furniture that attracted considerable attention and received much favorable comment at the Furniture Exhibition held in Toronto recently was the Bachelorette, as manufactured and exhibited by A. E. Guidal, Limited, Toronto.

The Bachelorette, which is covered by patents, is a combination china cabinet, kitchen cabinet, dining table and gas or electric stove. It is designed as an attractive piece of furniture, and when closed gives no hint of its great utility. Mr. Guidal, the inventor, who, needless to say, is a bachelor who batches, became tired of seeing his room strewn with pots, pans, dishes,



Guidal "Bachelorette" opened and closed

etc., and set himself to devise a camouflaged kitchen and china cabinet, which would take care of all cooking and eating paraphenalia, and which would not be an eyesore but would fit in with the furnishings of any room. The "Bachelorette" is the result.

A good idea of this article may be gained from the accompanying illustrations. When closed it might pass for a phonograph, sewing machine or some similar article. It is when opened that its utility is seen. The cover, which is fairly deep, is fitted up as a china cabinet, and provides space for the dishes required by six persons. It is fitted with ingenious holders and racks so that every square inch is utilized and the dishes are held securely, preventing breakage.

When the cover or lid proper is pulled out, which makes a table sufficiently large to seat four people, the gas plate or electric stove rises into position. At either end of the stove are two compartments with hinged lids, one of which is a bread or cake box, while the other is used for storing tea and coffee pots, saucepans, etc. The large drawer under the table top takes care of the silver, table linen, etc. At either end of the cabinet are two narrow deep drawers. One is fitted up to hold bottles of all kinds, salt, pepper, pickles, etc. The other small drawer is used for storing pots and pans. The large deep drawer in the centre of the cabinet takes care of the cereals, sugar, groceries, etc. Thus it would seem that nothing has been overlooked.

A clever attachment has been provided to close the gas as the table is pushed back in place. Thus if one were in a hurry and closed the cabinet, without turning out the flame, it would be done automatically.

There should be a strong demand for this handy piece of furniture. The appeal should not be confined to bachelors and girls who rent rooms or small apartments and prepare their own meals. With high rents and housing conditions as they are, it should appeal to families living in a few small rooms.

1921 to be Good Year

"A year ago I was considerably worried about the future, but I have no apprehensions at present," states W. Maxwell, Vice-president, Canadian Edison Phonographs, Limited, St. Thomas, Ont. "It seems to be very plain that 1921 is going to be a good year for every legitimate enterprise."

"It is natural for businessmen, who have gone through previous periods of business depression, to base their opinions on past experiences, and therefore many look for a gradual rather than a rapid recovery. In this situation past experience is not an altogether infallible guide, as we have a new kind of financial system, which, in view of the acute deflation of credit that has occurred, may contribute considerable resilience to the recovery of business. There is at present every indication that there will be a shortage of many kinds of merchandise, and there may very soon be quite a scramble among buyers and a different attitude on the part of the buying public. In certain lines of industry, it seems to me that the situation has been handled just about as badly as possible, and all branches of industry must, in some measure, pay the penalty. On the other hand, we shall all be benefitted when the deadlock is broken."

Newer Uses for Sawdust

Until quite recent times sawdust was regarded in wood mills as a waste product. Now it serves many purposes and has a commercial value of something like ten shillings a hundredweight, says Pearson's Weekly.

Sawdust is particularly useful in the manufacture of various building materials. Mixed with clay it makes splendid tiles and bricks, while combined with concrete an economical and good-wearing flooring material is obtained.

To French chemists belongs the discovery of sawdust dyes. They found that a combination of various chemicals acting upon sawdust produced a substance which is said to be quite as effective as the best aniline dyes for coloring purposes.

In Germany during the war a huge amount of sawdust was used for making bread. It was first treated with chemical agents to extract certain harmful ingredients, after which it was mixed with flour and baked in the usual manner.

Probably the most remarkable discovery of all is that a gas, excellent both for lighting and heating purposes, can be made from sawdust. From experiments that have been conducted in America it is believed that, particularly in the neighborhood of sawmills, the gas could be produced so cheaply as to be supplied for a few pence per thousand feet.

Gold Medal Celebrate 30th Birthday

The Gold Medal Furniture Manufacturing Co., Limited, Toronto, Uxbridge, Montreal and Winnipeg, recently celebrated its 30th birthday. This organization has enjoyed a steady and what to those interested, must be a very gratifying development. Starting in 1890 as the Gold Medal Spring Bed Co., a partnership

W. J. McMurty, president and general manager, Gold Medal Furniture Co., Limited, Toronto.

formed to manufacture spring beds, it was only a few years until both mattresses and upholstered furniture were added to the line. In 1899 the company was incorporated under the present name, The Gold Medal Furniture Mfg. Co., Limited, with a capital of $100,000, and W. J. McMurtry as president and general manager. Three years later, in 1903, the capital was increased to $250,000, and the present large factory erected in Toronto. In 1900 the Montreal branch was opened. Here the output was confined to springs and mattresses. The next development was the opening of a branch in Winnipeg, Man., in 1905. Like the Montreal factory springs and mattresses made up the line manufactured. The Uxbridge plant was acquired from the town of Uxbridge in 1912. This is an up-to-date woodworking factory and takes care of the woodworking requirements of the other branches. In addition to producing spring, chair, davenport and parlor suite frames for the various factories, a line of phonographs is being made and marketted at the Uxbridge plant.

The Montreal branch was reorganized in 1920 and incorporated as The Gold Medal Bedding Co., Limited. Paid-up capital $199,000. W. J. McMurtry is president and general manager of this company with W. R. Johnston, manager and vice-president.

The activities of the company are divided as follows: The Toronto plant is devoted to making upholstered furniture, springs and mattresses and also conducts a wholesale business in upholstering coverings and materials. The Uxbridge factory takes care of all the woodworking requirements of the other branches and turns out a complete line of phonographs. The Montreal and Winnipeg plants make a line of bedding, which includes springs, mattresses and steel frame couches. When conditions are normal, employment is provided, at the four factories, for about 350 men.

Managers and superintendents from Toronto, Montreal, Winnipeg and Uxbridge factories and over 15 of the firm's representatives from coast to coast assembled recently to inspect the Toronto and Uxbridge plants, and to discuss and map out a policy for 1921, in which service and honest workmanship was the keynote. All the members of the firm are justly proud of the enviable record which has been built up over a period of more than 30 years of aggressive manufacturing. The Gold Medal Furniture Co. has stood for all that is best in the industrial world and its success in the past will serve to inspire all to greater efforts in the future. Mr. McMurtry imbued all present with his dauntless Canadian spirit of cheerfulness and aggressiveness, and it is confidently expected that 1921 will mark another year of success for this progressive organization.

In the past two years three new officials have been added, W. R. Johnston of Montreal, formerly travelling representative for the firm; C. A. McMurtry and Bruce McMurtry. The personnel of the company is as follows: W. J. McMurtry, president and general manager; H. B. Shortt, secretary-treasurer, and George Hughes, W. R. Dalby and Claude A. McMurtry, directors.

With the progressive policy outlined at the conference and the perfecting of the organization through the addition of new members, it is fully expected that the business will be doubled in the next few years.

Edison on Eight Hour Day

On the occasion of his seventy-third birthday, Thomas A. Edison "consented" to take a half-day off from his work to permit his friends to celebrate the anniversary. On the subject of work and the eight-hour day, he said:

"I am not against the eight-hour day, or any other thing that protects labor from exploitation at the hands of ruthless employers, but it makes me sad to see young Americans shackle their ability by blindly conforming with rules which force the industrious man to keep in step with the shirker. I have always felt that one of the principal reasons for American progress in the past has been that every man had a chance to become whatever he wanted to be. It used to be fashionable to be ambitious. The employee planned to become an employer; the unskilled man sought to become skilfull. A young man was not well thought of if he were not striving for a higher place in life.

"Today, I am wondering what would have happened to me by now if fifty years ago some fluent talker had converted me to the theory of the eight-hour day and convinced me that it was not fair to my fellow-workers to put forth my best efforts in my work. I am glad that the eight-hour day had not been invented when I was a young man. If my life had been made up of eight-hour days I do not believe I could have accomplished a great deal. This country would not amount to as much as it does if the young men of fifty years ago had been afraid that they might earn more than they were paid. There ought to be some labor leader strong enough and wise enough to make trade unions a means of fitting their members for better jobs and greater responsibilities.'

Box Manufacturers Advertize Product

National Association of Box Manufacturers to Launch Extensive Publicity Campaign—Educate Consumer to Value of Wood Container—Offensive and Defensive Measures

By H. P. Howard*

Looking ahead from the height of prosperity in the spring of 1920 to the reaction which must sooner or later follow, the National Association of Box Manufacturers decided to undertake a co-operative trade extension programme to strengthen the wood box industry.

Preparations for this campaign were promptly begun, and we promptly encountered practical problems that had to be solved, and practical difficulties that had to be overcome. It was found that the usual method of employing an agency to handle the work was not practicable. The wood box is not so simple an affair as it looks, nor does it respond to ordinary advertising treatment. Unless the advertising writer is personally familiar with the many ins-and-outs of the wood-box industry, his copy is sure to be filled with technical and ethical errors which, while slight in the eyes of the average person, become absurdities to a box maker or a box user.

Scope of Publicity Campaign

In working out the general scheme of our advertising campaign, the general purpose develops three subdivisions: (1) Defensive measures, to modernize selling methods, offset activities of competing containers, show the superiority of the wood box and justify its cost, and develop containers using less wood. (2) Offensive measures, to develop cheaper packing methods, urge the use of wood boxes in lieu of other containers, and urge use of boxes for commodities now shipped in bulk. (3) Constructive measures, to standardize styles of boxes, create a demand for better boxes, co-operate with carriers to develop satisfactory shipping containers, co-operate with box users to meet their special needs.

In working out the programme, we have developed two lines of advertising. First, we help the individual manufacturer by designing and supplying advertising matter to be used by himself. The matter used is in the form of blotters, leaflets and enclosures, each conveying a single good selling idea, expressed in a few clear words, printed in readable type, and simply illustrated. A touch of good humor is added, and the whole is presented in compact and attractive form. The matter is furnished by the association to its members, who send it out by mail direct to those whom it is desired to reach. This method is both effective and economical. There is no waste circulation. Each message gets to the right man, and is likely to be read by him.

To Aid Members in Every Way

As was to be expected in a co-operative campaign, in which each member must help himself, there arose practical problems to be solved. Many members had never advertised by mail before, and they had to compile their mailing lists before they could determine to whom they wanted to send advertising matter and what quantity was needed.

To aid in this work, the association prepared and issued a pamphlet on "How to Compile Your Mailing List." Suggestions to aid the individual member in using the advertising matter were given in another concise pamphlet called "Create Good Will and Increase Your Sales." These have proven valuable aids, and the use of direct-by-mail advertising is now a settled policy among many members of the association.

The small amount of time and labor expended in this work by the individual member is a good investment, since it has given him a new hold on his own business and on his customers. More than that, it has reminded him of many former cutsomers, whom he had forgotten or neglected. Still more, it has stirred him to look around for possible new customers, especially among those who have been using other kinds of containers.

Work Getting Under Way

The secretary and his assistants helped the individual members to get under way, and this campaign was fairly launched in November, with matter which was sent out by individual members for December. After two months the progress made and the interest taken by members has been excellent. Results cannot be fairly estimated until the campaign has had a long test by steady, continued and concerted use.

Following the campaign to help the individual manufacturer, the National association is now about to launch a general advertising campaign on behalf of the industry as a whole, thereby also helping the individual manufacturer. This is true co-operation in its best sense.

General Publicity Work

The general advertising campaign will reach the most important lines of industry which use, or which should use, the wooden box as a container. Boots and shoes, canned goods, textiles, fruits, confectionery, and almost all the products of mill, factory, shop and dairy can be shipped to advantage in wood boxes. This is being suggested and urged through readable articles on the subject of boxes, their manufacture and uses all over the world. Some paid illustrated advertisements are being placed in the most widely circulated trade journals in the largest box-using industries. These advertisements and their illustrations are of striking quality, and will attract much attention. This part of the campaign is now under way, and promises to be a success.

Copies of illustrated advertisements will be furnished to members, to be distributed by them in their individual advertising campaign, thus linking the general advertising to the individual advertising, and making each support the other.

The development of our advertising campaign has taken much more time and labor than was anticipated at the beginning, which seems to be the common experience of those who have undertaken an advertising campaign. After going through the necessary period of organization and development, we believe that we have at last succeeded in producing a quality of advertising that will be a decided help to the wood box industry.

*Ass't. Secy. National Association of Box Manufacturers.

How Do You Figure Feetage in Box?

Uniform Methods of Calculating Lumber in Box Tends for Greater Accuracy and Eliminates Guesswork—Method Adopted by Many Box Manufacturers

By L. J. Conway*

No doubt many box users wonder at the wide variation in quotations received when a number of box makers figure on their requirements. This is due, partly at least, to different methods of figuring and apportioning costs. Primarily it is essential that the number of feet of material be accurately figured out, making due allowance for all waste, overlapping, extensions, etc. It is here where many box manufacturers fall down. They do not use any uniform method of calculating the feetage in a box and fail to make sufficient allowance for extensions.

In our estimating we have adopted Leaver's Estimator as standard, and work on the following rules:

1. A scale of additions to cover the extension or overlapping of different parts of a box, includin the cleats. This scale should be used uniformly all through the process of figuring.
2. The following schedule to cover the additions for every extension, these additions depending on the lumber used;

For two extensions over any	¼ in.	thickness add	½ in.
For two extensions over any	5/16 in.	thickness add	¾ in.
For two extensions over any	⅜ in.	thickness add	¾ in.
For two extensions over any	7/16 in.	thickness add	1 in.
For two extensions over any	½ in	thickness add	1 in.
For two extensions over any	9/16 in.	thickness add	1¼ in.
For two extensions over any	⅝ in.	thickness add	1¼ in.
For two extensions over any	11/16 in.	thickness add	1½ in.
For two extensions over any	13/16 in.	thickness add	1¾ in.
For two extensions over any	⅞ in.	thickness add	1¾ in.

3. Lay out your boxes into so many definite parts. The use of a diagram, as shown in the accompanying illustration with which to make your layout, is suggested.
4. Figure all Boxes net and on the Actual inside measure.—Example: A box 11½ wide inside measure with sides of ⅜ thickness figure the top 12¼ wide.
5. Figure only on the ¼ fractions. Example a box 5⅝ deep, figure the sides as 5¾ in. wide; in other words, change dimensions ending in 1/16 or ⅛ to the next ¼ fraction.
6. In making out your lay-out, remember the following: (1) add to the width of the top and bottom for the extension over sides Example: box inside measure 11/12 in. wide, sides ⅜ in. Figure top 12¼ in. wide.

   (2) Add to length of sides, top and bottom, for the extension in length over ends, as in style No. 1. Example: a box inside length 19⅝ in. with ends 13/16 in. thick, Add 1¾ for ends. Figure length of top or bottom as 21½ in. long (not 21⅜).

   (3) Add to the length of sides for extensions over ends and cleats as in style No. 4. Example: Inside length 19⅝ in., ends 13/16 in., cleats ⅜ in., add 1¾ for ends: add ¼ in. for cleats.

   This gives you 22⅛. Figure length of sides 22¼ in. Top and bottom, 21½ in., length over cleats and ends as in styles No. 2, 2½ and 3. Example: inside length 24⅝ in., ends ½ full; cleats ⅝in.; Add 1 in. for ends, and ¼ in. for

These are commercial or merchantable thickness with a reasonable variation permitted.

8. If full thickness without variation is required, then use next greater thickness for your basis of figuring.

B. If shook stock is to be dressed two sides and full thickness also, use next thickness of lumber except where specified in above list.

C. Veneers and Rotary cut lumber to be figured surface measure. A box constructed of a combination of lumber and veneer, each product should be figured as referred to above.

9. Crates and crating.
(1) Figure only on the ¼ fractions.
(2) For crating required full width, add ¼ in. to the actual width (figuring on ¼ in. only). Example: (a) Crating strips, 1¾ in. full figure 2 in. wide; (b) crating strips full ⅞ in. or 15/16 in. figure as 2¼ wide.
(3) Crating in fractional lengths figure length on the next ¼ in. as in shooks.

10. Lock corner and dovetailed boxes.
(a) Use the next thickness of lumber shown in above table for your bas's if stock is D2S.
(b) Add ¼ in. to length of ends and sides on account of extra projections of the tenons for lock corner or dovetailed boxes sold in the shook. Bottle boxes and standard boxes.

Courses in Boxing and Crating

Special courses on boxing and crating are to be given at the Forests Products Laboratory, Madison, Wis., as follows: January 10 to 15, 1921; March 7 to 12, 1921; May 2 to 7, 1921.

The object of this course is to demonstrate for manufacturers and packers the principles that underlie proper box and crate constitution and to develop economical containers that will deliver the contents in a satisfactory condition at a minimum cost.

There is a daily loss to shippers and manufacturers, conservatively estimated at $500,000, due to poor packing and to expensive and improperly designed containers for all classes of domestic and foreign shipments. During the year 1919, Class 1 railroads alone expended $103,078,862 for lost and damaged freight, and in July of the same year the western inspection bureau in 12 cities refused or repaired 43,738 packages.

The Laboratory has co-operated with associations and companies in improving the packing of widely varying types of commidities, such as electric lamps, cream separators, automobile parts, small tractors, talking machines, boiler castings, furniture, paints and oils, piano benches, fruit baskets and crates, and shoes. These tests and studies, in many cases, resulted in the redesign of the container. The new design gave increased strength and often decreased the amount of material used in its manufacture; gave security against pilfering; decreased the cubic contents; reduced labor and cost of manufacture; made possible more rapid production of packages; decreased cost of ocean freight; and permitted improved method of handling freight. This work is of value to all manufacturers, shippers, and dealers, and to the public at large, which is vitally concerned in receiving its necessary commodities in satisfactory and economical containers.

The course lasts 5½ working days. Reference material and condensed notes are given out, and it is necessary for those attending to devote a portion of each evening to study.

Only twelve men are accepted in a class. This makes possible the exchange of ideas and experiences with men from different organizations and the research men of the Laboratory. A series of supper discussions lasting about an hour, give further opportunity for friendly exchange of ideas. One subject is studied each day, and the day's work is completed with an oral or written review.

Monday.—Registration. "What did you come to get?" Tour of Forests Products Laboratory.

Drop tests to demonstrate characteristic failures of different types of boxes. Informal supper at 6.30 p.m.

Tuesday.—Drum tests to demonstrate the necessity of adequate nailing. Demonstration to show effect of varying number of pieces on sides and ends.

Wednesday.—Relative holding power of different kinds of nails. Effect of using green lumber for boxes. Tension tests.

Informal supper at 6.30 p.m.

Thursday.—Strapping, methods of application and efficiency. Influence of grade of lumber and location of defects on boxes and crates. Crate construction and tests. Drum tests.

Friday.—Solid and corrugated fiber board and wire-bound boxes. Identification of box woods.

Informal supper 6.30 p.m.

Saturday.—Source of supply and characteristics of box woods. Final questionnaire—"Did you get what you came for?" Final conferences.

A co-operative fee of $100, payable to the Forest Products Laboratory, is charged partially to cover the cost of conducting the course. This fee does not include travelling and living expenses.

Machinery & Equipment

Efficient Motor Driven Band Saw

One of the types of band saws manufactured by the West Side Iron Works, Chicago, Ill., is shown in the accompanying illustration. This is made either for belt or motor drive. If motor driven, the motor is mounted within the frame, on the shaft of the lower wheel. The bearings are long and large. The lower bearing rests on the main frame and has a bearing, 14" long, also a 5½" outboard bearing outside the pulleys. The top bearing is 14" long. The main frame is designed to support this bearing providing a planed surface 6½" wide. The wheel rims are of forged steel, turned and ground accurately and then assembled on a balanced hub by means of steel spokes. The wheels are trued up three times before the rubber bands are vulcanized on, after which another grinding and truing operation takes place. The table, which is 30" x 38", is supported within double circle castings. It will tilt 45° to the right and 5° to the left. All adjustments are made from the operator's side of the table. A speed of 500 R.P.M. is recommended for the plain bearings, while the motor driven type is run at 600. Circulars and full information may be had from the manufacturers.

Motor driven, ball-bearing saw

"Imperial" Thicknessing and Moulding Machine

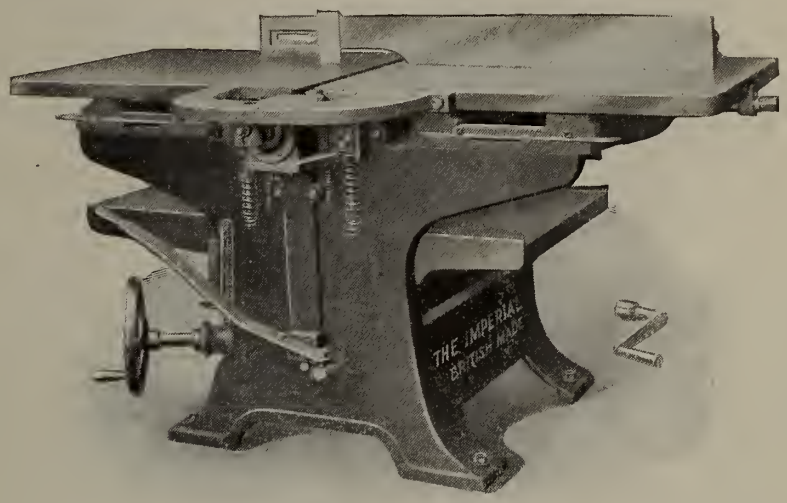
Information has been received from England relating to an interesting development in the manufacture of woodworking machinery.

The Hollis Wood Trimmer Company, of Wylde Green, Birmingham, England have undertaken the manufacture, on quantity production lines, of a number of machines heavily in demand in the British market. The principle which has been adopted is to manufacture as far as possible one machine in each works. The machines which are already under manufacture include spindle moulders, combined planers and thicknessers, circular saw benches, scroll saws, pattern makers lathes and smaller machines.

One of the machines produced under these conditions is depicted in the accompanying illustration. This is a Hand and Power Feed Planing, Thicknessing and Moulding Machine. It will perform surfacing taper and straight and to any width or thickness, jointing, chamfering, bevelling, cornering rebating, thicknessing — boards and panels, squaring up, planing to any angles to the side, tongueing and grooving.

The gear and driving pulleys are arranged at the back of the machine and since the operator stands at the front when working he is clear of all danger and able to obtain the maximum output. In addition, the gears are carefully covered with a cast iron guard, so that the safety of the operator is attended to in the fullest degree.

The machine is of the ball bearing type and indicative of the refinements which are included, is the index, which indicates the depth of timber being thicknessed, many woodworkers are now called upon to carry work out in the metric system. It is made in two sizes, the smaller size planing 15" wide and thicknessing up to 6", the length of the table top being 4' 8". The larger size planes 20" wide by 8" thick and has a length of table top 6'.



Combination planer and jointer.

Motor Driven Variety Saw

The illustration shows the "Lightning" 500 Direct Motor Driven Variety Saw for use in furniture factories, woodworking plants, box factories and variety shops or wherever a medium weight, wide range saw is required. This is one of the newer development in the saw line for variety cutting, grooving, gaining, etc. and the construction is such that all the adjustments can be made very quickly.

Saw blade runs in a cast iron chute with removable cover and is equipped with an aluminum guard above—no chance whatever for an accident. The

chute also removes the saw dust either to an exhaust or to a box if there is no exhaust.

Table is 36 x 42" and is a heavy, ribbed casting mounted on machine segments. It angles up to 45 degrees by hand-wheel and screw. A brass index plate shows the exact angle and the table has a vertical adjustment of 5". Both adjustments are self-locking in any position. There is no back-breaking

"Lightning", No. 500

strain required to raise table—the ball bearings on raising screw making it very easy.

With the 14" blade this saw will rip stock up to 3" thick, 17½" to right and 16" to left or will cut-off stock up to 1" thick and 18" wide. This saw is also equipped with a hollow chisel mortising and boring attachment and the mortiser can be used while the saw is in use without any interference. It mortises rapidly and accurately without pounding or jarring, making a perfect mortise with square corners and sharp edges. Uses mortise chisels from ¼" to ¾", any length of mortise and up to 3" deep.

Full particulars may be secured from the manufacturers, Messrs. J. A. Fay & Egan Co., Cincinnati, O.

Wood Brick From Mill Waste

After five years of surmounting obstacles, J. Wade Tucker, one of the most prominent lumber operators in the South, has completed his wood-tex brick, a brick in which he utilizes the waste material, such as sawdust, at his big cypress mills at Loughman and elsewhere. The brick is 2½ x 5 x 12 inches, which is larger than the vitrified brick used for paving, and it weighs six pounds less than other paving brick. It is considered indestructible, which eliminates loss from chipping. The extra size and lightness will, it is figured, reduce cost of laying. The plant at Kissimmee, Fla., opened last week and has a capacity now of 10,000 brick daily.

End Veneering Clamps

The end clamping device for clamp carriers, shown in the accompanying illustration, was originally designed at the request of piano manufacturers. The first design was one in which the clamps were stationary and after putting this in use it was found it would be more desirable if an arrangement could be made whereby the end clamps would be adjustable to any position desired on the carrier clamps. It was also found desirable to have these carrier clamps take up as little space as possible so as to provide for stock at least 2¼" thick. The device shown is the outcome. It has been used by a number of leading manufacturers during the past 6 months and they report it very satisfactory. It could also be used for framing doors, panels and various kinds of other work in addition to end veneering, and as a most valuable adjunct to the clamp carrier. The end clamps are always in place ready for use, yet they are not in the way when doing plain joint gluing.

The other illustration depicts a clamp on which stock up to 6½" thick can be glued. These can be furnished on all Taylor clamp carriers and revolving clamps. It is the same general design as regular carrier clamp but has jaws over 6½" high and provides a draw bar screw on top of the work. For further information write the James L. Taylor Manufacturing Co., Poughkeepsie, N.Y., or the A. R. Williams Machinery Co., Toronto.

Woven Fibre in Furniture of To-day

New Product Finding Its Way Into Many Furniture Factories—Comes in Rolls of Various Widths Ready for Applying

By Paul R. Hawn

For years, the imports of reed have increased with the constantly growing demand for more and greater production of all kinds of furniture. While the supply was not always hard to get, shipping conditions were such that the genuine imported reed could only be bought at a premium. A few of the more farseeing manufacturers had anticipated some such situation, and had carried on extensive experiments with a fibre produced in this country. While the business was yet in its infancy, comparatively speaking, the war broke out, and what was formerly only an aggravating condition, to be borne in the best humor possible, became a vital threat, to be met and overcome.

Then it was that woven fibre first began to appear. At first, it was looked upon in doubt, and was declared by many to be another impractical experiment which would not "take" with the general buying public. One manufacturer, with both faith and confidence in his own judgment, put out a line of "fibre furniture." The results were watched with intense interest by the trade in general, and particularly by other manufacturers in the same predicament, but who had lacked the necessary essentials to put across something new. Its reception was such a victory for the product, and a vindication of good judgment, that its use sprung into favor with manufacturers from coast to coast.

Because of its great demand, and the many shapes and sizes in which it was prepared, to suit the individual ideas of various manufacturers, the fibre was, for a long time, supplied in the raw form, being woven by hand by the manufacturer himself. To do this, another serious problem had to be met and overcome. The reed worker had been using the genuine imported reed for so long that he had become wedded to the idea that nothing else could take its place. When the added pliability or flexibility of hard fibre as compared with genuine reed, was proved by actual test; when its freedom from cracking and splintering was clearly demonstrated; when the increased amount of finished work per day was clearly shown, because of the features mentioned above, to say nothing whatever of the advantage to the worker, personally (who no longer went home at the end of a day's work with his hands blood raw from the constant stripping and handling of the material), it was firmly established with the manufacturer. Particularly so when it was shown that the per pound price, taking into consideration the question of yardage, was fully 25% less.

It was inevitable that sooner or later many further developments should be made, and that the round fibre should finally be woven by machines. The loom manufacturers contended that it could not be done with a shuttle loom, but as is oftentimes the case, the old adage, "Where there's a Will, there's a way", proved true in actual practice. Today this is being successfully accomplished, to the benefit of the general manufacturing trade, and to the ultimate benefit of the consumer.

The material is woven in rolls of various widths, given the selvage on both edges. Production costs have been cut to a minimum by using the machine woven material. Usually it is installed in a single piece for the back and sides of a chair with another sheet for the seat. The un-woven hard fibre is used for winding on the legs and in such parts of the frame as are left visible. The fact that the size of both the un-woven and consequently the woven material can be varied from about .1/16" to 5/32" in diameter, also makes for an added attraction in that a greater choice is afforded the manufacturer for his line, and the consumer, according to his or her tastes.

To say that the full scope in the use of woven hard fibre has been reached, or to say that the limit has been reached in the manufacture of woven hard fibre itself, would be as foolhardy as for one to declare that electricity has reached its limit. As in the beginning necessity was the "mother" of the invention, so may the need arise later for further developments, or other changes in the form of the material. Just what the next step will be, no one can clearly foretell, but that resourcefulness accepts no limit is a truth not to be doubted in view of past proofs to the contrary.

Montreal Upholsterers Form Association

One of the newer association to be formed in Canada is the Montreal Upholstered Manufacturers' Association. This association was organized during the latter part of December. Up to its formation the upholstered furniture industry in Montreal was in a more or less demoralized state. A number of small men were enabled to start manufacturing upholstered lines, through the assistance of certain retailers, and in consequence prices were cut and the confidence of the furniture trade undermined. The new association embraces practically all upholsterers, both large and small, and it is felt that through the co-operation made possible by such an organization and through the mutual confidence, which will be established, the industry in Montreal will be placed on a much more stable basis. The effect of this complete understanding will be felt not only in Montreal and vicinity, but throughout the whole furniture industry.

A large furniture factory in the States has a moving stairway to carry furniture from one floor to the other.

A foreman who studies the trade papers is a more useful man to have about a plant than one who could give you a tip about a possible loser.

How We Can Secure Industrial Stability

The Seven Instincts of Man—More Attention to Industrial Stability—Self Expression a Prime Factor

By D. D. Fennell*

(Continued from December issue)

It must be admitted that organized labor with its limited vision, its restrictions, limitations and rules, never was and never will be as efficient as unorganized labor. To-day I am an advocate of the open shop, not because of what it accomplishes by way of better production for the employer alone, but because of the opportunity it affords the employee for progress and advancement. Organized labor as at present organized and led will never be a contributing factor to the attainment of a more stable condition in industry.

What part has so-called industrial democracy played in stabilizing industry? We must first determine what we mean by industrial democracy. John Leitch has a plan which has been marked by both success and failure in its installation. This is committee representation through a house of representatives and a senate of employees. W. L. Stoddard developed for the War Labor Board a shop committee plan, which has been intermittently successful and represents a conservative and efficient type of industrial democracy plan. But the term "industrial democracy" is a very inclusive one. It comprehends necessarily every phase of the movement in industry which is in opposition to autocracy and paternalism., The co-operative societies of England have a part in this movement.. In England to-day there are 1,500 co-operative societies organized and controlled by workers. They have $350,000,000 of share capital. They do a billion dollars worth of business annually; own 12,000 acres of farm land. They own great steamships going to Denmark, Holland and various other places, and they own great tea plantations in Ceylon, cotton plantations in India and many factories manufacturing clothing essentials. Here is a movement in England representing 500,000 men with a capital of 350,000,000 doing a billion dollars worth of business a year, and their plan is a serious threat to the plan of manufacturing and merchandising as generally established. This organization has been in existence since 1844, starting with a membership made up of 26 weavers, but has made its most rapid growth in recent years.

The threat of this movement and its possible misdirection lies in its recent alliance with the labor union movement of England. This plan of manufacturing and merchandising will never be constructive of industrial stability, because of its alliances and the world-old failures of communistic and co-operative experiments. It has certain inherent drawbacks which will limit the scope of its operations.

According to Prof. Irving Fisher, there are seven major instincts in man: Self-preservation, self-expression or workmanship, self-respect, loyalty, love of home-making, worship and play. For purposes of analysis this outline is reasonably comprehensive.

Now stability for present purposes in industry can only be accomplished when we recognize that anything which affects any man employer or employee, in any department of human life, affects all. The interdependence and inter-relationship of mankind are such that there is hardly a plan put to work in a division of industry which does not directly or indirectly influence the lives of every man, woman and child in the world.

Production in industry depends on the will of the worker. The scientific psychologists tell us it is impossible to isolate the "will." There is no such thing as a "will" apart from character. Any legitimate psychologist will protest, with a great deal of feeling, against the schools that are to-day giving courses of instruction in "will development." Will is human character in action. Will is the expression of a man's life, revealed to the world in his personality.

Men are ruled more by their beliefs than by laws. While we are treating of production as a means of engaging man's thought and man's physical ability, gentlemen, we should appreciate the fact that men are influenced more by their beliefs than by law, more by their concept of the law than by the law itself.

Several years ago I was engaged as a consultant in a big power plant. We were endeavoring to cut down the cost of operation. I took over the buying, which had not been well done after I determined such items as packing, piping, steam specialties and coal were all purchased at too high prices. We found that by changing our source of supply on the one item of packing we could cut down the cost considerably. When the new packing came and was handed to the engineers and the firemen to put into the pumps and engines, they refused to use it. We asked that the new brand be used for a little while to determine its quality. They put it in and reported that the brand was of poor quality, so the chief engineer tried a little experiment. He put the new packing in some boxes with the labels of the kind of packing the men liked and gave it to them. The engineers at once told us how much better that packing was than the poor stuff they had been using. Men are influenced by their beliefs—what men believe to be right, what they believe to be their duty and what they believe to be their productive ability We must direct belief and will so there is a "will" to accomplish in our employees rather than a "won't" or wish not to accomplish.

Instinct of Self-preservation.

Self-preservation is a major instinct. Why do men work at all? You know the fear of hunger is very close to the heart of every man. It matters not how big a man's job, unless he has set aside through thrift and careful savings a certain amount to protect himself, there is always the thought that the wolf is at the door. It is as inherent in man as the desire to eat and drink.

I recall seeing the other day a most interesting thing as I was coming north from Indianapolis on the train. It was a hot day and the sun was shining down mercilessly on the fields. Under a small tree there were, perhaps, twenty-five horses forming a circle with their noses together and their heels out. Ten of the twenty-five were under the tree and fifteen were outside in the sun. There was room enough for all the horses in the shade, but moved by the instinct to protect themselves they stood with their heels out and their noses together ready to repel any attack which

*Director Industrial Relations National Association of Upholstered Furniture Manufacturers

was more important to them than getting under cover of the tree. These peculiar tendencies and instincts of past modes of living come back to men also. Always there is that fear in man that he or his family may go hungry, and that is why men work.

It is with constituted leadership in industry in co-operation with the employee that the building up of progressive constructive beliefs must lie. Only as the employer develops unshaken confidence on the part of the employee in his integrity and spirit of fair play can anything like stable conditions be established.

Self-expression of Workman

Self-expression or workmanship is a major instinct in man. If any of you gentlemen heard or read the address which I delivered in West Baden, you will recall that I stressed on that occasion, and I have always done so, the fact that the passion for self-expression is a basic one with men.

Away back in the geological age, before there was any organic life to be found, there was a spirit in the rocks which called for the existence of organic life that was so dominating and strong that there appeared on the earth lower vegetable forms, as well as protoplasmic animal forms, a jelly-fish sort of life that was the initial form of organic life. In that formless organism was the insistent desire for vertebra and brain which found its answer in a higher form of life. This tremendous urge pushing life higher and higher bore a wonderful fruit when man was born. This urge or instinct of self-expression crowned its determinative effort with the dawning of the human mind when man became a mental animal, which he is primarily. When one considers what this instinct for self-expression has accomplished—the inventions, explorations, researches in all the various fields; the rise to leadership of a Lincoln or an Edison, he is led to question if the instinct of self-expression is not more insistent than the instinct of self-preservation.

A totally ambitionless employee is an anomaly.

The young man in industry has ambition, and is a mental animal who will not be denied his privilege of exercising it. You cannot dam up the water of a man's purpose to a progress. If you do, it means destruction. Any false movement on the part of employers that will restrict the progress of employees will bring about disaster and incalculable waste

(To be concluded)

An Upholstered Phonograph

Heretofore the manufacture of phonographs has been confined largely to case-goods manufacturers, cabinetmakers and general woodworkers, but now we find an aggressive upholsterer placing what he calls the "Davenola" on the market. This consists of a large comfortable chesterfield of the usual style, with the exception of the arms, which are low, wide and flat, in one arm is placed a phonograph with horn underneath, operated by an electric motor. The horn opening is hidden by a small covered door, which is not noticeable when closed. To operate the phonograph the top of the arm, which is hinged, is raised, exposing the turn-table, controls, etc., and the drop-door, covering the horn is swung open. The other arm is constructed with hinged top or cover and is fitted up as a record case. The chesterfield itself is of the usual stuff-over type, deep upholstered, and may be had in the usual run of coverings.

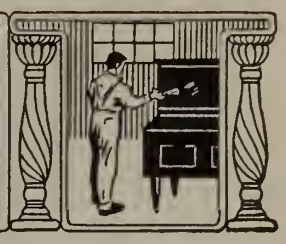
THE FINISHING ROOM



The Rapid Drying of Varnish

C. A. Cutler Presents Some Interesting Information Pertaining to the Drying of Varnish — How Varnish Hardens — Outlines Controlling Factors

By C. A. Cutler*

The complete chemical action which takes place as varnish hardens is not known, but the principal actions are known and probably would be interesting to varnish users. Varnish is made of vegetable gums, drying oils and evaporating thinners. There are, of course, many kinds of gums used and also many kinds of oils and thinners. The various combinations of these different materials and in varying relative quantities, go to make up the many different kinds of varnishes which naturally have somewhat different drying characteristics, but the hardening process is always the same,—first, evaporation of the thinners and then oxidation of the oils.

The thinners such as turpentine and naphtha are put into varnish principally because that mixture of gum and oil which would make a suitable varnish would be too thick and viscous to flow out evenly. There is also a claim that turpentine has some beneficial effect on the hardening or oxidation of the oil. Of any varnish, approximately 55% is evaporating thinners. These thinners must be a material that will volatilize quickly and at low temperatures. They should evaporate and leave no residue.

After the evaporation of the thinners has become nearly complete and the fumes have been carried away or at least well mixed with fresh air, then the oxidization process begins. There is left in the varnish just the oils and the gums. The harder grades of gums would harden at any temperature below 200 degress Fahr. but are held in liquid condition by the oils, so that the only problem after the thinners are removed is to harden the oil.

How Oils are Eliminated

The oils used are called drying oils in distinction from other oils, like olive oil for instance, which does not dry. The drying of an oil is a chemical process in which the oil gradually changes into what are called glycerides and fatty acids. There is an absorption of oxygen from the air by the oil and a further evaporation of the fatty acids. The oil will actually increase in weight by reason of the oxygen absorbed. The speed of this process depends upon the condition of the air surrounding the varnish and the driers which are put into the oils before it is put into the varnish.

Certain chemicals have the property of increasing the speed of oxygen absorption and are called catalysers. A very small percentage of one of these driers is introduced into the oil under conditions which are largely the secrets of the varnish making business.

*President Cutler Desk Co., Buffalo Manufacturers Cutter Dry Kilns.

In general, the lasting quality of a varnish is dependent upon the kind of gum used and upon the relative quantity and grade of oil used in the making of the varnish. It is also generally true that the drying time increases with each additional amount of oil. The value of a quick drying and at the same time a long life varnish are so obvious that we need not discuss that point except to say that this is what all varnish makers are striving to make.

Controlling Factor in Drying

Having a given varnish, the time required to harden is dependent upon the air conditions surrounding the varnish and into which it must throw the turpentine or naphtha fumes and from which it must receive the supply of oxygen to oxidize the oil to the degree of hardness required.

Evaporation of the thinners will be much faster in warm air than in cold air. Therefore, it follows that at least for the evaporation process much time could be saved if the coat of varnish was heated to the highest temperature that the varnish, or the material upon which the varnish was spread, would stand without injury. In making varnish the gums are heated to as high as 700 degrees Fahr. and the oil to somewhere around 300 degrees so that in most cases the determining factor as to the degree of heat that could be used, would be the material upon which the varnish was spread. In other words, a temperature of 250 degrees might not be harmful to the varnish, but it certainly would be to a piece of wooden furniture, and so the varnish itself is seldom the determining factor. The effect of heat on varnish has been discussed so far as evaporation is concerned but how does heat effect the process of oxidization?

Heat Assists in Work

The breakdown of the oils into glycerides and fatty acids is greatly accelerated by heat. The transformation of the fatty acids into fumes is also speeded up by heat. Therefore, heat will shorten the time required to get the oil into condition where it begins to absorb oxygen, which is the principal hardening process. Although varnishes are sometimes described as drying from the bottom upwards this is nevertheless distinctly untrue. It hardens by the absorption of oxygen from the air and obviously the air can be in contact only with the outside surface of the coat, so it must dry from the face inward. If the drying conditions are such that the top and bottom of the coat are in exactly the same condition as to temperature and evaporation, then the hardening will proceed evenly. But let us suppose that a freshly varnished piece was put directly into a temperature of 140 degrees Fahr. and let us suppose that the piece was a wooden table top 1½" thick. If the coating is heavy the varnish next to the wood will remain the temperature of the wood much longer than the surface of the coat which is in contact with the heated air. The surface would be in a hardening condition before the bottom of the coat had started and the

result would be what is called "skin-dried" or "case-hardened." The surface, in drying becomes more dense and delays the fumes of thinners and fatty acids from underneath and also the oxygen from getting into the underpart of the coat. Of course, there are some kinds of varnishes that are so long in oil or so slow drying that the temperature and condition of the bottom and top of the coat would be alike long before the surface had hardened enough to make any difference, but varnishes of this type are seldom used. If the varnish had been spread upon thin metal instead of thick wood, the bottom of the coat would have been heated nearly as quick as the surface and therefore, the danger of skin drying is very much less than would have been the case with a non-conductor of heat, like wood.

Thickness of Coat a Factor

The difficulty of uneven drying of varnish increases with the thickness of the coat. What is generally called a "standing coat" is less subject to skin drying because the varnish must necessarily be put on in a thin coat to prevent "sagging" when the piece is in a vertical position. Tops and horizontal surfaces require a better finish than other parts because they are most conspicuous and because they are seen with a more or less side light which exaggerates any slight defect in the surface of the varnish. These parts are given a "setting coat" and are dried in a horizontal position. There being no chance for sagging and a necessity for as nearly as possible a perfect surface, a very heavy coat of varnish is applied and the danger of skin drying increased with the thickness of the coating. Saddle seats of chairs for instance, require a very nearly perfect surface and therefore a heavy coat will flow slightly and the low spots will have an excess of coating. These spots will "sweat" after rubbing when all the rest of the seat is quite dry.

Skin-dried varnish will "sweat" after it has been rubbed because the hardened dense surface has been removed and the unhardened oils underneath are still in a flowing condition. One of the characteristics of oil is that it will, by capillary attraction spread out over a great area and varnishes being porous, the oil comes to the surface and spreads out in blotches. When this happens the varnish must be given more time to harden before these spots can be rubbed out.

Speeding Up Drying Process

It has been shown that the thickness of the coating effects the speed of drying and that heat speeds up the drying process but that subjecting a coat to too rapid a drying condition will, because of skin drying, delay the complete hardening of the coating. In other words, the greatest speed of drying in heated air that a given varnish will stand without skin drying to a degree that is detrimental, is determined by the thickness of the coating and the material upon which it is applied.

Inasmuch as it is by absorption of oxygen from the air that varnish hardens, it is natural that the heating of varnish coats be done with heated air. In other words, we would naturally put the coated piece in a heated room or kiln. In order to dry evenly the heat must be even. The tendency of heated air to rise would make the upper part of the kiln warmer than the bottom unless some provision was made to prevent this from being the case. The usual and simple method of procuring even temperature in all parts of a kiln is to create a rapid circulation of the air. In the thinner evaporating stage, the circulation of the air also carries away from the surface of the varinsh, the fumes which if allowed to remain would keep the oxygen from getting to the varnish and thus delay the hardening. In a large room with only a small amount of thinner fumes would not greatly delay the oxidization, but it is necessary that the air be kept fresh and nearly free of fumes. Some very efficient system of ventilation should always be provided to care for this point when the kiln is to be loaded reasonably full. The total amount of oxygen that is contained in a cubic foot of air is not great and only a small part of it available for the oxidization of oils. All other things being equal, a well ventilated kiln will harden varnish much faster than one that is not so well ventilated.

Best Drying Temperature

Experience has shown that when ventilation and circulation have been properly provided, that a temperature of about 116 to 120 degrees Fahr. is best for the average varnish used on wooden furniture and for varnish on metal such as automobile bodies, a somewhat higher temperature can be used.

In addition to the time saved there are other advantages in drying varnish in greater than work room temperatures. In a properly constructed kiln that is being operated correctly, the varnish is dust-proof, quicker and therefore cleaner. It dries with less porosity because the thinners are evaporated out of the varnish before it has stopped flowing and minute pores caused by the escaping fumes close up again. Being less porous it will last longer and not mar so easily.

In conclusion varnishes dry better and faster when heated in a kiln in which an even temperature is maintained and in which proper and adequate provision has been made for circulation and ventilation.

Overcoming Bleeding in Re-Finishing

Trouble is often experienced when enamelling or painting over surfaces that have been stained mahogany or painted red. The trouble takes the form of the bright original color working or blending through the newer finish.

Before refinishing any red surface it should be tested as a precautionary measure to see if it will bleed. Brush on a little white lead and oil paint and observe the action. Sometimes the old red is quickly dissolved by the oil, and again it takes a few days' time.

These reds are usually soluble in alcohol, oil or water, and so the first step before refinishing the surface is to remove as much of the red as possible by washing with the material which dissolves it most rapidly. The use of liquid varnish remover is usually the quickest way to take a red off interior surfaces. It would probably be too expensive to use on large outside walls. Sandpaper and steel-wool will help.

To remove a bleeding red paint from large exterior surfaces, the paint burner, steel scrapers and wire brushes are most economical. If that labor expense is too great, the next best procedure is to choose a color which will not show the effect of a bleeding red greatly—a terra-cotta, slate or buff, perhaps. That is not certain to overcome the trouble, but probably will. Reds often bleed through as many as four and five coats of white. Bleeding reds are not as commonly met with on exterior surfaces as on interior.

How to Finish Inside of Case Goods

Inside of Work Should Receive More Attention — Formulas for Inside Surfacers—Dull Finish Advisable

By Dixy Wells

More and more attention is being given to the finishing of the inside of drawers, etc., of the better quality of case goods. Manufacturers are coming to know that good work all the way through, is what counts with the best type of consumer. That portion of the public which is discriminating in its taste is influenced in its choice by the way the inside of the pieces are finished. This class of buyers is greater than is generally supposed.

Popular tastes are daily improving, and we have seen many otherwise acceptable articles rejected when the inside was poorly finished, and also when the color scheme both outside and in was not sufficiently appealing to influence the final sale. Popular taste is pretty good after all, and you can generally rely on the average. There is an old adage which runs, "Be the labor great or small, do it well or not at all," and when you consider that the cost of doing things well is very, very little more than to slip through, it certainly pays in the end, and the idea recommends itself to the most careful finisher.

Value of Careful Work

To do work indifferently is to cut down the average of good sales. Work poorly done makes a half-hearted appeal, places a greater responsibility and effort on the store salesmen, and cannot help in the long run but cut down the profits of the manufacturer. There is great advantage in having work of this character correctly done. The inside of drawers and other receptacles as a rule should be stained several shades lighter than the outside of the bureau for instance; especially if the color of the latter has been artificially deepened to any great extent.

We find that a great many goods are dipped these days, and where this is the case, it is more or less difficult to keep the inside lighter than the outside, but dipping in stain is a practice which we believe does not commend itself to the best finishers. Of course, there is economy and perhaps other advantages in dipping small parts where they can be finished off at once with a brush. We do not, however, recommend the practice of dipping everything. The inside of goods should be stained before the outside, and great care exercised to avoid dropping the darker stain on the work which is finished in a lighter shade. If the outside is stained first and then some of the darker stain will drop on the light work, you can readily imagine the blotch it would leave, and if the workman through carelessness or bad luck makes such a blotch of any considerable size on the inside, the damage can be remedied by working it out with some lighter stain, provided, of course, the remedy is applied before the blotch has become thoroughly dry.

Dull Finish for Interior

We believe it is most practical to finish the inside dull no matter whether the outside is polished or not. Many varnish manufacturers now, however, are making regular dull drawer varnish. For goods finished in egg shell gloss or dull rubbed, the inside should be done in a real flat finish, the very dull drawer varnish being used on polished stock. You will not find this always practical, but it has advantages where it is so used.

Be sure that the inside of the drawers are made smooth and soft to the touch. This matter should receive attention when selecting the varnish with which to do the work. In order to produce a smooth, soft finish, no matter what kind of varnish is used, it is necessary to have the finish properly prepared. For this we believe there is nothing better than shellac, but the high cost of this material at the present time makes it advisable to look for a less expensive article.

Some finishers have very satisfactory results in applying a glue size or some of the cheaper line of goods, but inasmuch as it is difficult to sand smooth we do not recommend it for the better grade of case goods. We would suggest as the most satisfactory way to do this work that you first stain with an oil stain, as this will not raise the grain like a water stain, and requires less sanding in order to make it perfectly smooth; or the staining may be entirely eliminated, and a colored varnish surfaces used in its stead.

Making Mahogany Surfacer

If you desire it mahogany color, the ordinary varnish surfacer that is on the market may be colored with any of the mahogany colors that are soluble in oil or turpentine. Dissolve the color matter in the proper solvent, and add to the surfacer in sufficient quantity to produce a color of the desired depth.

One may make a good surfacer for this purpose by using the following simple formula: Mix together equal parts of varnish and to each quart of this mixture add one pound of finely ground and sifted silex. Get the pure silex, as there is a substance known as silica that is sometimes called by that name, but does not produce as transparent a surfacer as the former. Let the silex and varnish mixture stand for twenty-four hours and then reduce this to a free working consistency by the addition of turpentine or other suitable reducer. A mixture of turpentine and benzine will answer the purpose and considerably reduce the cost.

You should always apply a colored surfacer with great care in order to avoid streaks and laps in the finished work. Sand the surfacer to a smooth finish when dry with a fine sandpaper. You cannot exercise too much care to have the work well dusted and cleaned off before applying the final coat. Unless the necessity for the exercise of care is impressed upon the mind of the average workman he is apt to consider this part of the work of no great importance, and accordingly slights it, but the inside corners of drawers, etc., always hold dust until the varnish brush takes it up and spreads it over the surface, unless great care is taken to remove these particles by thorough dusting.

It is always well to finish up the work on the inside before the outside varnishing is started, especially, when this can be done without holding up the work. However, when you do this you must be careful and not allow any of the flat finish to get on and remain

on the outside surface of the work. If you should be so unfortunate, wipe it off carefully at once, using a rag you have moistened with turnpentine, which it is well to always keep close at hand for this purpose.

It is possible to finish the inside of walnut goods just the same as recommended above for mahogany, coloring the surface with asphaltum varnish instead of coloring matter of mahogany shade.

Gums Used in Varnish Making

Five principal gums or resins are used in the manufacture of varnish. They are Juniper or sandarac, dammar, amber, copal and Elemi. Each is different from the other in composition and each has its particular uses in the making of varnishes.

From distant Algeria and northern Africa comes the commercial supply of sandarac, which is not great in volume. Originally it is found in long yellowish dusty tears and has an agreeable balsamic smell and is bitter to the taste. It exudes from the bark of the sandarac tree from whence it is gathered. It is used carefully in varnish for its excess renders varnish hard and brittle. Commercial sandarac is often a mixture of African resin with dammar or hard Indian copal.

Dammar is gathered from conifers of New Zealand, Queensland and India, the trees sometimes growing to enormous altitudes and attaining basic diameters, of nine feet. The resin flows spontaneously and in such quantities that it hangs like icicles varying in length from the breadth of a hand to more than 12 in. When first exuded the resin is very soft and possesses a peculiar odor, but upon drying this smell is lost. Large chunks of the resin are obtained after cutting the tree. In Asia dammar is used domestically, but in this country chiefly in the making of varnishes which dry quickly with a bright luster which is not permanent. It therefore cannot be substituted for copal or amber.

Copal is a name used more or less indiscriminately of various gums. East Indian or African is known as tender copal, while the Mexican variety is known as hard copal. Other sources are Zanzibar, Mozambique, New Caledonia, New Zealand, East India and Brazil. In New Zealand the resin is chewed by the natives much the same as our stenographers Fletcherize gum. It comes in round smooth masses, generally colorless, translucent, and is a mineral substance of vegetable origin.

The production of amber yearly is less. To-day its last big stronghold, as it has been for centuries, is the coast of the Baltic Sea. A little is found on the shores of the Adriatic and near Sicily. It is a fossil resin. Often insects, perfectly embalmed and of now extinct species, are enclosed in the amber. Some pieces have been found which weighed 13 pounds. Great amounts are used in Mohammedian worship. Its melting point is the highest of all resins, 550 degrees Fahrenheit.

Elemi is a fragrant resinous substance formerly brought from Egypt, but now obtained in America. It softens by the heat of the hand. Elemi is still used extensively as incense in Eastern countries.

Try these:—A kind thought, a kind word, a kind deed.

There was never so much need for the best as today.

Better make occasional mistakes than never try a better way.

Preparing Mahogany Veneer for Staining

To finish mahogany veneer care must be exercised to see that it is as smooth as glass before it is fitted, otherwise it is liable to be clouded. Some mahogany is so woolly that it is extremely difficult to get it quite smooth, and in order to do this some have it glue-sized before giving it the final sanding. This is a mistake, for if an oil stain is to be used it will not take properly over the glue; and if a water stain is used, the glue will soften and mix with the stain, destroying much of its transparency, and imparting to the article a murky appearance. In order to make mahogany veneer thoroughly smooth, it should be sponged with clear water before it receives its final sandpapering. This will not only raise the fuzz so that it may be cut off during the last sandpapering, but will raise any bruises that may have been made in this very soft and sensitive wood.

Sponging is an important point, and one of which there are differences of opinion. But to insure a clear brilliant, transparent finish on most mahogany it is necessary to do one or two things: to sponge it with clear water or stain it twice, sandpapering after sponging or between the coats of stain. Any difference between the two is in favor of sponging with clear water. The fuzz raises much more prominently on some mahogany than on others, which renders it necessary to sandpaper some more than others. Now, if the mahogany is stained to raise the fuzz, and some of it requires to be sanded down to the white before it becomes smooth, all the rest must be sanded equally, or it will be darker after receiving the second coat of stain, unless several different shades of stain are used This trouble is not experienced where sponging with clear water is employed, except in such rare instances where the wood is so fuzzy that none of the processes will meet its requirements.

The finishing should be done with very fine paper It is difficult to give the grade of paper to use, as different makes of paper are not graded alike, but any paper that is fine enough to glasspaper varnish without scratching should be about right for finishing after sponging. All that is required is to cut off the fuzz. If more than this is done, more fuzz is loosened and rises when the stain is applied. The paper, though fine, should be sharp, because if it is pretty well worn out it will press the fuzz down instead of cutting it off.

Appreciation from Sunny South

Rivero & Sinclair
Manufacturers' Agents
503 Brady Building,
San Antonio, Texas, Dec. 31, 1920.

Canadian Woodworker & Furniture Manufacturer,
345 Adelaide Street,
Toronto.

Sorry to trouble you so much, but wish you would change our address to Apartado 34, Monterrey, Mexico.

We look forward to receiving your paper each month, as it contains such good articles and information and its form is pleasing to look at. The clearness and arrangement of the printing and cuts are worthy of the highest praise.

Yours very truly,

Cia Manufacturera de Artefactos de Madera.

Your Product
Finished by

The Aeron Operator

The Aeron operator can become as proficient and as big a factor in cutting costs and improving results in your finishing room, as he has proved himself to be in thousands of other finishing rooms now using the

Aeron Finishing System
(Surpasses Brushing)

Spray-finishing Equipment

The Aeron operator does his work with greater ease and advantage than a hand-brusher, regardless of size or style of article finished. While the equipment provides for cleaner, more healthful working conditions.

At the same time that his speed of finishing averages 4 or 5 times that of the hand-brush method, the coatings he applies are uniform and of highest consistent quality.

Write and let us show you further the advantage and economy of having your product finished by the Aeron operator.

The DeVilbiss Mfg. Co., 3718 Detroit Ave., *Toledo, O., U.S.A.*

Clean, white factory walls stimulate efficiency and production.
The Aeron System Portable Painting Equipment will cut factory wall painting costs and do a better job.

High Grade Stains and Fillers

In our Stains you will find the highest possible color values—they are positive—they are permanent. Manufactured in quantities from the best quality raw materials.

Wood Fillers also that have been tested under the most difficult of varying circumstances and found satisfactory.

Eliminate trouble in your finishing department by using these tested materials.

All Cats Look Grey in the Dark—

And all makes of abrasive papers *look* pretty much alike. But when they're tried out, up jumps the "difference".

For instance—

In Detroit, one day last summer, P. Landen, foreman of the finishing department of the Sewell Cushion Wheel Company, ran tests on several brands of abrasive papers.

Speed-grits sanded an average of 124 wooden wheels before it wore out, to its nearest competitor's 30. Today, you'll find Manning Speed-grits doing 100% of the sanding work in this plant.

Then comes this report from the Manning Philadelphia salesman:

"Called on Mr. Paul Weaver, of Weaver's Art Shop. He said, "Kafka, I don't know when I can give you another order—your goods last so long. The one on the machine has been in use for six weeks and it's still good." (Note:—The disc actually lasted 8 weeks, sanding approximately 6400 pieces—soft and hard wood and composition which is harder than wood.)

Now skipping across country to Rockford, Illinois, we meet Ed. Pettit, foreman of the sash department of the Rockford Builders' Supply Company. He uses Speed-grits—No. 1½ Garnet Paper, 6 inch—on his big sander. When asked about performance he said, briefly but clearly, "It's the best d - - n paper I ever seen."

But why go on. There is a difference between Manning Speed-grits and "just" sandpaper and—"*Good Workmen Know the Difference.*"

The Nichols' Varnish and Paint Dryer

A complete unit of fan, motor, heaters, air compressor, with automatic humidity and temperature controls.

A new rotary humidifying air washer, which eliminates all dust and dirt, does away with all spray heads, pump and connecting piping.

Manufactured in sizes suitable for all requirements.

DO YOU KNOW:

That the finest pianos, talking machine cabinets, furniture, and automobiles are finished by this method?

That the finish can be dried cleaner, faster and better in this way than by any other method? That the work is more durable and stands up better?

That all varnish shrinkage takes place in the DRYING ROOM, coat by coat, during the drying period, and not days or months later in show room or home?

That on cold mornings the finishing room can be quickly warmed, increasing comfort of men, coating efficiency, and condition of varnish?

That the finishing room can be properly ventilated and the health, working conditions and comfort of the workmen much improved?

That these results are obtained the year round, in Summer and Winter(irrespective of outside weather conditions?

That the investment pays for itself in one year or less?

These are FACTS and guaranteed by the A. S. Nichols Company, Sole Agents for all territory East of the Ohio, Mississippi and Detroit Rivers, in the United States and Canada. We are prepared to answer questions and quote prices on any drying problem. Communications covering varnish drying propositions west of the above mentioned territory, should be addressed to the Drying Systems, Incorporated, Chicago, Ill.

We also continue to manufacture the Nichols' lumber and veneer dryers that we have been making for over thirty years.

A. S. NICHOLS COMPANY

Aeolian Hall, 33 West 42nd St.. NEW YORK, N. Y.

Buy and Build for the Future

The woodworking industry to-day is hungry for quality service. The manufacturer possessed of vision, builds for the future, and ensures his business by a consistent supply of high grade veneers.

There is beauty and permanence in our

Rotary Cut Veneers, Birds Eye Maple, Plain Birch and Maple Veneers

The present prices—the quality of our product—the prompt efficient service, these are good reasons why you should buy now.

BeVeCo VENEERS

Veneers and Panels

Is Thick or Thin Veneer Best?

Less Strain on Glue Joint With Lighter Face Stock—What Are Advantages of Heavy Veneer?—Suggestions for Manufacturers of Veneered Doors

By R. H. Mellatt

The relative advantages or disadvantages of thick and thin veneers are not everywhere given the attention they deserve. One may present strong arguments in favor of using either heavy or light stock, but in the main it would appear as if the thinner veneer should be given the preference. In the furniture, piano, phonograph and similar industries the veneer used is comparatively thin, from 1/16 in. to 1/32 in. in thickness, while in certain phases of interior woodwork and in the manufacture of veneered doors it seems customary to use stock ¼ in., 5/16 in. and ⅜ in. for face work. If the thinner lines are more satisfactory for casework, why should they not prove just as desirable for other forms of interior work, or on the other hand, if thick veneers give better results on interior and door work are the case goods people making a mistake when they use thin material?

Judging from the viewpoint of conservation and economy, it would appear that within reasonable limits, the thinner the veneer the better. Cutting the fancy wood in thinner sheets would tend to make the available supply of fine cabinet woods go farther, last longer, and should result in keeping the price within more reasonable limits. On the other hand, the losses due to handling would be greater and more care would have to be exercised in gluing and laying.

In Favor of Heavy Veneer

Those who pin their faith to heavy veneers usually advance two arguments; first, that the thicker stock withstands harder usage and gives better service; second, that with the thick material the glue joint is afforded better protection, for with the heavy face stock the glue line is not effected by every slight change in atmospheric conditions.

The first contention has a lot of truth in it. A blow from some sharp object which might fracture or even make a hole through a layer of thin veneer, would only make a nasty dint were the face stock heavier. Many of the examples of fine old furniture, which have been handed down from antiquity and which seems to have been fairly successful in withstanding the wear and tear of years of service, are veneered with good solid veneer ⅛ in. or more in thickness. It is doubtful if 1/32 in. stock had been used that they would be in such good shape to-day. However, there is this to be said, that furniture or any form of woodwork which may be built up with this material will stand up for many years and outlive both the manufacturer and the purchaser.

The glue joint may be given greater protection, for comparatively short periods, by a thick face veneer, but at the same time it is subjected to considerable more strain. It takes moisture longer to be transfused through ¼ in. wood to the glue line than were 1/16 in. stock is used, but if the high humidity or changed conditions hold long enough the joint will ultimately be affected. Wood, no matter how thick, will reach a constant or equalized condition if exposed to certain conditions for a sufficiently long period. That means, that storing a veneered door in a damp place or leaving it where it will be exposed to dampness or the weather, will not affect it, if such exposure if of short duration, but no matter how thick or how thin the face veneer, if left under such conditions long enough, the moisture will reach the glue joint.

Finish Does Not Keep Out Moisture

Someone may say that were the article, whether door, panel work or piece of furniture, to be painted or finished, the moisture or dampness could not penetrate to the wood, let alone the glue line. This is an erroneous impression. It has been clearly demonstrated, by the Forest Products Laboratory, that all our modern wood finishes, whether paint, enamel or varnish, are only water resistant, not water proof. That means that wood well protected by paint will slowly pick up moisture or dry out as the case may be, from the surrounding atmosphere and reach a state of equilibrium with it. Then, whether thick or thin veneer is used, whether painted or unfinished, the glue joint in any piece of veneer work will ultimately be affected by the average humidity of the climate or conditions to which it may be exposed.

This brings up the question of glue line strain. In swelling or shrinking which would exert the most force on a glue joint, thick or thin veneer? Naturally the thicker stock would and this would be in ratio to the cube of their sections. Thus a piece of face stock ¼ in. thick would exert just 84 times as great a strain on the glue joint as would a piece 1/16 in. thick, under similar conditions.

Result of Experiments

The Forests Products Laboratory at Madison, Wis., have made many experiments covering this point and have expressed themselves as follows: "It is true that thick layers of wood when glued to each other with the grain of adjacent plies at right angles, as in plywood, do develop greater stresses upon glue joints than thin veneers with a given change in moisture content. This has been shown very clearly in connection with the manufacture and testing of water resistant plywood for aircraft purposes. With an increase in the thickness of the veneer it becomes more difficult to manufacture plywood that will withstand severe water resistant tests. With good gluing methods 1/16 in. veneer and less can be made to pass very severe tests, while with 1/12 in. material a large percentage of failures usually occur, and with still thicker stock it is even more difficult to obtain highly water-resistant panels. With the thick veneer the stresses become so great that the glue joint is often ruptured. These

statements pertain to plywood made from veneer of low moisture content and with water-resistant glues.

"The thickness of the veneer along with other factors determine the rate of change in moisture content which is largely responsible for the permanency of the glue joint. The total percentage of change in the moisture content is, of course, also important. The thicker veneer, such as ¼ inch, is claimed by some manufacturers to keep out the moisture from the glue joint. While this tendency doubtless exists to some extent, it applies only within certain limits. The moisture content of a veneer ¼ inch thick does not change as quickly as one ⅛ inch and less; however, if exposed for long enough time to a constant set of conditions, the ¼ inch will eventually come to the same moisture content as the thinner veneer and will then exert a very much greater force on the glue joint. For short periods of exposure to changed conditions there may be some foundation for the statement that the thicker veneer is less affected.

"There are, of course, a number of angles from which this question may be discussed. We believe, however, that the door industry might well consider the adoption of thinner veneers for faces than they are now using. This opinion is based both upon the experiments that have been conducted here and upon the general practice of veneering in other lines of wood work."

It would appear then, that from the point of resistance to wear, tear and hard usage, the thicker sizes are to be preferred, but for ordinary service and more especially where climatic conditions are a factor, the thin material is by far the most advantageous to use.

What Constitutes Correct Pressure?

Many Faults Laid at Door of Too Heavy Application of Pressure—What is Best Pressure to Use?—Fixture of Wood and Kind of Glue Important Factors

By John Welmers

There has been a lot written about pressures with reference to veneering and possibly more said, and still there is always a bone of contention remaining to be picked. The same is true with practically all lines of work, for men are constantly on the outlook, endeavoring to find new and better ways for doing things. It is well, too, that such should be the case, for the world advances only as the ideas of men advance.

All veneered work and built-up stock owe their longevity in a certain degree to the pressures that were used in their making. I say, "in a certain degree," because if the pressures used are right and everything else wrong, it would have been just as well if no attention had been paid to the pressure.

Special Attention to Glue

Generally speaking, the glues used for veneering are not of the best, that is, in adhesive strength, and the very best glues are hardly advisable, for if conditions are proper it does not require a great deal of strength to prevent thin veneers from coming loose. But that is where the hitch is, the little word "if." We cannot expect a cheap veneer glue to hold a core, with an unequal distribution of moisture, from swelling or shrinking, but we may expect it to hold and prevent slight changes due to climatic conditions, over which we have no control. So, seeing that we use cheap glues for veneering, the thing we want to do is to get the maximum results from the glue, that it is possible to obtain.

This can be done by mixing the glues according to the manufacturers' recommendations. It is to their advantage to experiment and test in order to find the best methods of mixing their glues, so they will give most value, both in adhesion and spread, for the money spent. In the case of animal glue, a careful control of heat is essential.

No Hard and Fast Rule.

With the glues properly mixed, of the right consistency and temperature, and everything else O. K., the question of pressure naturally is of prime importance. You ask, "What is the proper pressure to use?" and, to be frank, I will say "I don't know." Carrying the thought a little further, I believe I would be safe in saying that there has yet to be laid down a hard and fast rule governing pressure, that will apply equally as well to all sorts of veneering. There are so many and varied uses of glue, and so many kinds of wood and glue, and so many densities to the same species of wood, that it would be almost impossible to expect a certain pressure to be correct in all cases.

A pressure of 100 pounds to the square inch is the favorite rule in many veneer rooms, and is found quite satisfactory. However, that is arbitrary. Different concerns use different woods and where one would find 80 pounds suitable for his purpose, another might be using 110 pounds to the square inch. One might be using a soft or pourous wood into which the glue would penetrate very easily, while the other might be using a hard non-porous wood requiring a heavier pressure to give a little penetration. In order to be sure you are getting the pressure you want on a hydraulic press, be sure to test or have tested the gauge which registers the pressure exerted.

Density of Wood Important

Porous or open face veneers act about the same as a sieve in some cases, for they fairly strain the glue, carrying it from the glued surface on the paper or caul, thus causing a starved joint, especially if the pressure used was the same that was used for a non-porous veneer. This merely furnishes an illustration which is but one of a number that require a little forethought with regard to pressure and density of glue.

The control of pressures is important, but no more so than a lot of other things. If you want perfect work, or nearly so, give equal thought to all the things that go to make a perfect panel.

The best safety device known is a careful man.

Careless habits show a poor workman.

Iron does not grind so freely as steel on emery wheels usually supplied for grinding cutters.

A special guide is needed to sharpen twist bits if you want them to cut at a very fast speed.

The installation of an exhaust shavings system is an improvement which tends to lessen the fire risk.

Drying Veneer in Specially Constructed Kiln

Material Hung on Edge From Wires Attached to Ceiling—Hot Blast Principle Employed—Gives Satisfactory Drying Conditions

A new type of veneer drying kiln, which on the whole is revolutionary in its design and method of handling the product, and yet incorporating several proven factors, which have been in more or less general use, has been successfully built and operated by the Forest Products Co. at its Linnton, Ore., plant.

As the particular drying problem confronting the company's operation not being easily overcome by the use of other methods except at prohibitive expense, R. L. Rankin, plant manager for the company, created a plan of operation in which the hanging of the veneers was the controlling feature. The material is hung, on edge, in the kilns after the manner employed in hanging hardwood face veneers in slow-drying seasoning chambers or as clothes are hung on a line on wash day.

Special Clip is Developed

In order to accomplish this, it was first necessary to perfect a double-ended spring clip strong enough to hold several sheets of veneer suspended, one upon the other, from the wires stretched lengthwise the roof of the kiln. This resulted in the perfecting of a clip similar to those used by photographers in hanging prints, except the former would sustain a pulling strength of 50 pounds.

Two kiln chambers were built by the company with a capacity of 15,000 feet of veneer each; wires are run lengthwise the room, 1½ inches apart and stapled to the ceiling joists. From these wires the sheets are hung, on one other, from the ceiling to within a foot or so of the floor.

After the chamber has been filled to capacity, a large blower fan delivering sufficient air to create a strong circulation is started up. The air, previously heated by passing over a heating element of pipe coils, is forced into the chamber at the top, where it is distributed through openings in the ceiling and down through the veneer, where the moisture-laden air is taken out through return ducts at the bottom of the walls along the floor line. The air is then returned through the heater, thence into the fan, and back into the kiln again, picking up moisture from the veneer while in transit. Should the air become too heavily laden with moisture, or, correctly expressed, the humidity become too high, part of the moisture is condensed between leaving the kiln and before it returns to the heater, thus allowing the controlling of the humidity, to the end that the most economical point is maintained to promote perfect drying conditions.

Capacity 70,000 Feet in Eight Hours

While one chamber of veneer is passing through the drying period, the other is discharged and charged, thus enabling the drying of 70,000 surface feet of veneer during two eight hour periods out of each 24 hours, while the third eight-hour period is occupied in discharging one kiln while the other is being charged. This schedule makes possible the drying of 140,000 surface feet in each 24 hours.

Means have been provided whereby the temperature of the air entering the chamber may be regulated with a thermostatic controller, which opens up the steam valve on the heater coils or shuts it as the temperature reaches minimum or maximum. Condensation from the heater coils is trapped and returned to the boiler, where it is used again. Waste from the cutting plant more than provides fuel for the boiler.

Three-sixteenths and one fourth inch veneer sheets are dried to a satisfactory percentage of moisture content, in eight hours with ease. Where the material is fir it has been dried in six hours, leaving the material in excellent condition.

Owing to the fact that there are no sticks used in separating the veneers, the air circulation and the shrinkage, is not retarded, which allows for a most uniform condition of drying and prevents the usual buckling and checking to be found where conditions are not uniform. With this method of hanging the veneers, the same may be closely inspected at any time as the drying operation proceeds, and the conditions may be easily changed if not satisfactory. Actual results show that the larger sheets of veneers can be hung with half the labor that it takes to pile it on sticks, and can be taken down with nearly one-third the effort.

A platform four feet high on castors is used in hanging the top sheets, and the lower sheets are hung by standing on the floor. The cut-downs and small percentage of narrow stock accruing from the operation are placed on sticks in one end of the kiln.

He Didn't Notice

For 20 years two chess players met daily at Brown's chophouse, took their places silently, silently played their game, and silently departed. For 20 years a third party sat by and looked on.

Then one of the players failed to show up—for the first time in 20 years. After waiting a few minutes, his partner said to the onlooker, "I guess he isn't coming to-day. Will you play his men?" "Sorry," was the answer, "but I don't know the game."

He had followed every move for 20 years, but he didn't know the game. He had watched the drama of king and castle for two decades without sensing a single undercurrent of strategy, speculating on a single motive or anticipating a single coup.

He had displayed infinite patience in looking at the game, but he couldn't be bothered looking into it. He showed every symptom of life except its first symptom—curiosity.

He belonged to that listless army of passive observers who clutter up the sidelines of business—men who look without seeing, listen without hearing, do without understanding.

Placed in an office—at a bench—he would remain 20 years ignorant of his neighbor's job, his superior's problems, his own significance. When the opportunity for advancement came he would have to say, "Sorry, but I don't know the game."

The petrol engine will play a big part in the future in cutting logs to sizes in the woods.

The ball bearing seems to be in a fair way of ousting the ordinary self-lubricating one.

Treatise on Vegetable and Casein Glue

Development and Application of These Two Adhesives—Improved Conditions in Glue Room—Invaluable for Export Trade

By Fred M. Knappen*

For some time prior to the outbreak of the world war, manufacturers of glued work had been experimenting with substitutes for hide glue, which for years had been the standard adhesive of the trade. These experiments tended toward the adaptation of certain starches processed and treated in such a manner as to form an adhesive paste suitable for use in the manufacture of plywood.

The starch obtained from the root of the cassava seemed to meet with the greatest success and to most nearly approximate hide glue. This plant grows in Java and often is erroneously called tapioca, this error arising from the fact that commercial or edible tapioca is a product of the same root, but manufactured in a different manner. This prepared cassava starch had come into quite general use by the time the United States entered the war in 1917, owing partly to its merits as an adhesive and partly to the scarcity of hide glue.

Hide Glue in Tire Manufacture

Not only was hide glue hard to obtain, but its cost has increased to an unreasonable point due to the shutting off of foreign sources of supply which previously had furnished a large proportion of the raw stock entering into the glue manufactured in this country. About this time the automobile tire industry began to assume large proportions and to absorb nearly all of the animal glue produced in this country. It is due to this ever increasing demand that, even after the war, the scarcity and high price of this production continued to the practical exclusion of other industries which formerly had been large consumers.

Unfortunately, for the manufacturers and users of cassava glue, the conditions which prevented the importation of raw stock for hide glue also restricted the importation of cassava flour by commandeering a large part of the bottoms which had previously been engaged in oriental trade, and employing them in the transportation of war materials and supplies.

To this restriction was added the ruling of the government which classified cassava flour as a foodstuff and prohibited its importation for commercial purposes. This culminated in the use, by the various demands for this flour, the result of which was the manufacture of a number of most ungodly preparations, which made the lives of the users thereof far from one sweet song. With the cessation of hostilities and the resumption of normal trade, these glues naturally resolved back into their original forms, until they now are giving as good results as those obtained before their down fall.

Casein Glue Developed

During this same pre-war period, the manufacturers of casein, whose product for years had been used as a sizing in the manufacture of straw goods and as a coating for certain papers, had been seeking further use for their product, which in combination with certain chemicals formed an adhesive possessing waterproof qualities. Up to the time of the outbreak of the war very little was used in the woodworking industry except in the manufacture of the cheaper kinds of plywood, especially shooks for packing cases.

The war, with its necessity for waterproof plywood, created an insistent demand for a satisfactory adhesive. To meet this, the manufacture of casein products bent every energy to the production of a successful glue which would meet the exacting requirements of government specifications. At the start this adhesive was rather cumbersome and required an expert to properly mix its components, which was done in an agitator; but constant laboratory work on the part of the producers soon resulted in a powder product in which the ingredients were properly combined and required only the addition of water at the mixer.

The principal difficulty encountered in the use of this glue was its extreme hardness, with its attendant effect upon tools. This difficulty has now been overcome to a large extent, by decreasing the proportion of one of its ingredients. This change in formula has, to some extent, sacrificed the waterproof qualities of the glue, but has resulted in a product better suited to the requirements of a commercial work where absolute waterproofing is not a prime requisite.

Same Equipment Suitable

A double beater mixer is used in the preparation of both cassava and casein glues, and is equippel with a steam jacket for cooking cassava flour, but which is not necessary when mixing casein. A corrugated roll spreader, having tanks for both upper and lower rolls, is used in applying both of these glues. This uniformity of equipment makes it possible for manufacturers using these glues to use either one at will as the demands of their output may require.

It is now rather doubtful if many users of either starch or casein adhesives would consider resuming the use of animal glues, even though the price were to be restored to a competitive basis. The practically compulsory use of these substitutes has taught their superiorities in various ways; the outstanding advantages in their use being the comparative ease of preparation, the improved glue room conditions due to their use when cold, and the sustained uniformity in consistency after mixing.

Tensile Strength and Holding Power

Casein glues have a tensile strength equal to, if not exceeding, that possessed by the best hide joint-glues; while that of starch glues, though adequate for nearly all ordinary veneering purposes, is lower on a comparative scale. This higher adhering quality makes possible a much thinner spread for the same relative holding power. The thinner spread decreases the amount of moisture to be absorbed by the wood during gluing, thus decreasing the length and time necessary for drying out panels and minimizing the danger of warping.

In preparing stock for the glue room, when casein glue is to be used, it is unnecessary to reduce the moisture content of the veneers to the point required when vegetable or animal glues are used. In fact experiments conducted by the Forest Products Labor-

Treatise on Vegetable and Casein Glue

(Continued from page 114)

atory show that with casein the best results were obtained when the moisture content of veneers was considerably greater than the allowable maximum when used with other glues.

It is the practice of a large number of wood finishers to employ dipping tanks for the application of water stains. Assembled cabinets are emersed in the stain and then hung up to drip. This is bad enough; but some, to hasten drying, put the wet cabinets in a room with an excessively high temperature. This almost surely results in disentegration of the panels built with a starch or even an animal glue, but has no effect upon panels made up with a casein glue.

During the past few years, owing to the inability of plywood manufacturers to produce the vast amount of built up stock required by the woodworking industry, a great many large consumers were obliged to install complete gluing departments in order to insure their supply. With the coming of normal conditions, these installations will not be adandoned. In order to keep their large plants in full production, it will be necessary for plywood manufacturers to enter the export field more extensively than heretofore. This necessitates the use of a water resistant glue which will not be affected by storage in damp warehouses and hulls of vessels, or by the stresses occasioned by the heat and humidity of the southern lattitudes. The requirements of this trade are met by casein—only partially by other glues.

Lack of Standard in Glues

There is no drawback which has a direct bearing upon the satisfactory use of either of the glues described above. I refer to the lack of standards. As many of you gentlemen know, the Plywood Manufacturers' Association has taken official cognizance of this condition and has made arrangements with an industrial chemical laboratory to develop a set of standards covering these glues. In the near future it may be possible to purchase glue on specification and be assured of a uniform product suitable for the purpose for which it is intended. The successful completion of this work undertaken by the association, while of great benefit to its members, cannot fail to have an effect upon the entire glue-using industry, and for this reason should receive the support of all those interested in the use of these glues.

Shrinkage of Veneer from Boiled and Steamed Logs

According to present practice, logs which are to be cut into veneer are either steamed or soaked in hot or boiling water for several hours to soften the wood. The claim is sometimes made that the veneer from boiled logs is likely to shrink and swell less with changing moisture content than the veneer from steamed logs. This point was made the subject of investigation by the Forest Products Laboratory at a plant using both methods of preparing the logs.

Thirty sheets of 1/12 inch rotary-cut birch veneer, 60 inches square, were selected from about six logs prepared in each way. The sheets were carefully measured, passed through a textile drier, and measured again.

The average moisture content of the boiled veneer and that of the steamed before drying was practically the same, being 64.8 and 65.5 per cent., respectively. The average moisture content for both kinds after passing through the drier was 10 per cent., and the moisture contents of all dried sheets were between 7 and 13 per cent.

The shrinkage caused by drying was found to be the same for both kinds of veneer. When the dried sheets were resoaked, they expanded to their original dimensions, and when subjected to a second drying shrank as uniformly as before.

Although these tests were very crude, they indicate that the shrinkage of veneer from boiled and steamed logs is practically the same. The variation is no greater than is found between pieces from different logs which have undergone the same treatment.

Moisture Content of Wood Independent of Density

Even after long exposure to the same atmospheric conditions, different pieces of wood do not have exactly the same moisture content. Variations of 2 per cent. were recently found in red oak blocks stored under carefully fixed humidity conditions at the Forest Products Laboratory.

These moisture differences, unlike variations in strength, are apparently independent of the density of the pieces. In the laboratory experiments, the variation proved to be as great in blocks of the same density as it was throughout the lot of specimens. Moreover, the range in moisture content was the same in wood of low density as in wood of medium density or high density.

Data on a few representative specimens are given in the accompanying table:

Density of specimen	Average moisture content in percentage of weight oven dry Relative humidity at 80° F.		
	38%	61%	88%
Low			
.519	7.6	11.2	19.4
.527	6.0	10.0	17.4

High Grade ROTARY CUT VENEERS
Specializing BIRCH DOOR STOCK,
MAPLE PIANO PIN BLOCK STOCK

Years of Experience Behind Our Products

The Munising Woodenware Co.
MUNISING, MICH.

OUR PRODUCT IS FOUND AMONG DISCRIMINATING BUYERS

BECAUSE we have perfected every detail of our organization. Each department was planned with painstaking care with the definite end in view of a product of unsurpassed quality. This involves a rigid selection of logs by expert log buyers surveying a wide territory, perfect mechanical equipment and its undeviatingly correct use. Our four band mills and three veneer mills manufacture the best obtainable in quartered and plain white oak lumber, sawed quartered oak veneers, walnut lumber and sliced and rotary cut walnut veneers, rotary cut yellow poplar crossbanding and a general line of high grade hardwoods.

WOOD-MOSAIC COMPANY

LOUISVILLE, KENTUCKY

THE EQUIPMENT IN OUR THREE VENEER MILLS IS ALL MODERN AND IN EACH CASE DEVOTED TO CUTTING ONLY THAT CLASS OF MATERIAL FOR WHICH IT WAS PLANNED

Hardwood as a Heavy Duty Flooring

Writer Says Profitable Field Being Overlooked—Oak Floor Gives Fifty Years Service in Foundry—Has Many Strong Features

By R. J. Stone

Sometimes a manufacturer of oak flooring experiences difficulty in disposing of some of the lower grades of flooring which are culled out from his product. A market for this material that is often overlooked, or, at least, is not receiving the attention it should, is to be found in industrial buildings, including factories and warehouses. Here is a field, which, if worked consistently and aggressively, is capable of absorbing a large quantity of such material.

This is a business that requires a little working up. The choice of material for flooring in factories, warehouses, mills and similar buildings, where there is heavy traffic, is not always given the careful consideration it should receive. In such structures the material for flooring is all-important. The floor in a warehouse, for instance, is often renewed a number of times before any extensive repairs are necessary on the overhead construction.

Require Special Consideration.

The floor is not like the walls, on which there is no wear and tear. It is in daily use as a part of the working equipment. Different conditions require different degrees of endurance in the floor. One that stands the strain in one factory may not do at all in another. It depends upon the nature of the work done, whether there is trucking, etc.

On every hand are examples of building designed with great care as to appearance, but having inferior floors which are a constant source of trouble, delay and expense. In looking over the situation before deciding upon the flooring, the careful business man should ask many questions about any type of flooring suggested.

No. 2 common oak flooring, formerly known by the trade name of "factory oak flooring," is the most suitable flooring for factory and warehouse purposes. It is strong and heavy, tough and resilient. It is not subject to premature decay, like some other hardwood flooring. It is less susceptible to the degeneration known as "dry rot." Its cell walls are thicker, offering much more resistance to the boring operations carried on by the spores of the low order of parasite which causes "dry rot."

Economical and Efficient.

Where there is trucking to be considered, tightly fitted, blind-nailed oak flooring in this grade presents the ideal trucking floor. It means greater ease and speed, which mean greater efficiency. How often workmen are seen slamming and banging a heavily-loaded truck over an uneven floor, damaging alike the truck, the merchandise, the floor and their own tempers? In large buildings where the annual cleaning bill runs into thousands of dollars, the facility with which such flooring can be swept and cleaned means a big reduction in maintenance cost. The light flooring oils, made expressly for this purpose by many paint and varnish houses, make an economical finish for the factory or warehouse floors, where a high-class finish is not desired. It helps to preserve the floor and keeps dust from rising.

The modern business man realizes that the health and general well-being of his workers are only other ways of increasing efficiency. Anything which affects the health or spirits of employees is always reflected in production. The clean, bright appearance of a good floor in office, storeroom, or workshop, goes a long way towards creating contentment. Concrete or stone floors are cold, hard, and "dead." They are tiring to the feet and very detrimental to the health. It is a common sight in factories, where concrete floors are used, to see a workman standing on a plank before his machine, thus offering the highest testimony to the fact that he does not like such a floor. Concrete floors are also destructive to tools and fragile articles which may be dropped on them.

Give Long Service

Instances may be cited which show the long life and service given by oak floors in industrial buildings. Perhaps one of the most striking examples is that of a large manufacturer of gasoline engines who laid an oak floor in his foundry fifty years ago and it is still in service. What other type of flooring would give such service? Besides, it is warm under foot, easily kept clean and has many other advantages not possessed by other flooring materials. What has been said about oak, applies more or less to all kinds of hardwood flooring.

If oak flooring is so suitable and serviceable for heavy duty floors, what steps are being taken to impress such facts upon architects, contractors and owners of large industrial buildings. Many figure that anything of oak is too expensive for ordinary use or ordinary purposes. Such is not the case. Factory or No. 2 common oak flooring could be sold at a price that should compare favorably with any other similar product on the market and in view of the service rendered it should be especially desirable. The standard sizes for such heavy duty flooring are 13/16 in. x 1¾ in., 2 in. or 2¼ in.

Course on Kiln Drying

How to assist the lumber dealer to prevent loss in the kiln drying of lumber is the basis of the Short Course in Dry Kiln Engineering to be given at the New York State College of Forestry at Syracuse from March 7 to March 25.

Extensive experiments have been carried out by the Utilization Department under the direction of Prof. H. L. Henderson and several interesting features have developed which will form the subject of discussion in the Short Course. It is the aim of Professor Henderson who has charge of this work, to demonstrate by laboratory exercises and lectures the economic use of kilns of various types and to give the men a thorough drill in kiln operation. Many prominent experts have been scheduled for talks and demonstrations in kiln work which will be invaluable aid to the men taking the course.

A circular saw properly sharpened makes less noise than one with the teeth all shapes and sizes.

VENEER OF QUALITY

We carry in stock, for immediate shipment, 3 and 5 ply Panels in Birch, Oak, and Mahogany — sizes 24" and 30" wide, 48", 60" and 72" long.

A complete range of American Walnut, Mahogany, Quartered Oak (in all thicknesses) Figured Gum Veneers and Rotary Cut Veneers is stocked at our plant awaiting your selection.

Our best advertisement is a **trial order**—because more orders come pouring in with requests to "repeat the same quality."

This is not a difficult request for us to fill because we handle nothing else but **quality veneers.** Let us convince **you.**

Shall Wages Be Reduced or Maintained?

(Continued from page 69)

up, as we are short of houses, therefore people take advantage and put up rents. Re cost of living, we cannot see that it has come down but very little; we think wages here are a little lower than in Montreal.

"Our rates are from 50 to 60c an hour and we think others round here are paying about the same."

What Ontario Manufacturers Have to Say

Sees signs of increased efficiency. "There has been no change in our factory up to the present time, although we have had considerable unemployment in one or two departments. We also note that we have been getting better service from our employees, especially the casual kind, not our regular men, but those who during the last year or two have been drifting and very independent as to whether they worked or not.

"We think that in the course of the general readjustment of prices which has taken place, that wages will be somewhat reduced, but not until living conditions are more favorable. The journeymen carpenters have made a demand for a higher wage rate for the coming season, but we think that this is largely to offset any move which might be made by their employers in the way of a reduction. Nothing can be definitely said, however, until a month or two later, when we will know pretty well how the spring work will open up."

* * *

Asking employees for increased productiveness. "Insofar as our company is concerned, we do not anticipate making any reduction in wages. We believe that the wages we are paying, which are about as follows, are none too high:

55c to 60c for machine men.
65c to 75c for department foremen.
40c for ordinary labor.

"We are putting it up to our employees, however, to increase their efficiency by greater production. We may say that we have interviewed others in the woodworking industry, that are operating along lines similar to our own and they expressed their desire to maintain the wages they are paying at the present rate."

Sharp Decline Not Desirable

Ontario woodworker advices caution and co-operation. "It would seem to us that lower wages will prevail. Commodity costs are gradually coming down and the cost of production will also have to come down if the industry is to remain solvent. Wages in the woodworking industry will necessarily have to adjust themselves to the general level. A cut in wages would not cause increased demand for wood products, but like every other commodity, wood products cannot be sold for any protracted period at prices less than production costs.

"As to whether mechanics or laborers are receiving too high scales of wages is something that it is hard to say. All values are necessarily relative. For example: If it were possible to establish a standard of wages one hundred per cent. higher than the present levels, the same standard of efficiency being maintained, the production costs would respond and things generally would remain just about as at the present. Now deal with the question from a purely national standpoint. The scale of wages that must prevail will always have to bear a very direct relation to the world value of the product being produced. It is our opinion that employers of labor should do everything possible to prevent a sharp decline in wages. It is not in the interest of Canada, in our opinion, that wages be reduced beyond a point actually necessary to make possible the production of Canadian commodities on a cost basis that would keep Canadian industry alive and permit us to compete with the rest of the world.

"It should be the aim of all to maintain Canadian standards at the highest possible level and to do this to that end we would welcome anything in the nature of a concerted effort on the part of the manufacturer and employer of labor generally."

More Employers Favor Present Rates

Average scale should be maintained. "In our case a reduction is hardly justifiable for the reason that we feel we have not paid the maximum rate. If we had we would certainly introduce a lower scale without hesitation. To be frank, our policy has been to give a man steady work. Therefore, he is satisfied with a lower wage, which is more to him in the long run.

"We are paying as follows:

Head sash and frame maker	75c
Next man	65c
Sticker hand	50c
Machine hands	45c
Yard men	40c

"This is a fair wage, as we work 10 hours per day, with the exception of about three months in the winter. If there are many firms that are forced to pay the maximum they should get it down to do it quick."

* * *

No change for the present. "We do not believe there can be any reduction in the wages paid to skilled employees at the present time, though a slight reduction in the wages paid to unskilled labor might be made in some factories.

"Our rates of pay at present are as follows:

Foremen	60c an hour
Machine operators	50-55c an hour
Bench hands	50-55c an hour
Yard and general help	35-40c an hour

"We do not believe a reduction should be made. The wages paid in other industries in this district average about the same. The cost of living has not been reduced enough to be a very great help to the average working man and we believe that the wages paid at present should prevail for a time.

"There is no doubt in our minds that a reduction in wages would increase sales."

* * *

Increased production the solution. "The question as to the wisdom of endeavoring to reduce wages at the present time, when the country is in a more or less unsettled condition, as regarding labor, is a very ticklish one. It is our opinion, that if wages can be maintained and production increased, the country will be in a stronger position, and more money will be in circulation, as the working man, when in possession of money, is a free spender. The essential point is that production must be increased and the man receiving 60c per hour must produce 60c worth per hour. If the working man realizes this, and gives an honest day's work in return for an honest wage, the cost of building and building materials will be reduced considerably."

When reconstructing the mill along modern lines, don't forget the transport of material. Tracks, transveyors, conveyors, lifts, etc., will make up for the shortage of labor.

The Lumber Market

Domestic Woods

The situation with regard to domestic woods, such as pine, spruce, basswood, birch, maple, shows signs of improving. That is, enquiries have been more numerous during the past few weeks and more lumber has been sold. The feeling is rife in local circles that the tide has definitely turned and that from now on there will be a steady improvement. Prices ,which are off anywhere from 30 to 45 per cent. from those which prevailed a year ago, are expected to show a slight upward tendency, though it is not anticipated that the high levels of 1920 will be reached.

While the peak prices of last year are not expected to be touched, local woods are likely to advance in price. Apart from the fact that stocks are below normal and production away off, production costs have not dropped to any appreciable extent. It is figured that the production costs on lumber for the early part of 1921 will be within 10 or at the most 15 per cent. of those which prevailed last year. What has been gained because of lower wages in the woods, increased efficiency and the general decline in prices, has been offset to a large extent by the unfavorable logging conditions which existed, and the fact that smaller quantities of logs are being brought out. The following figures give an idea of the price of birch on the Toronto market. These quotations are for strictly grade material and must not be confused with grades from which certain stocks have been removed:

4/4 Birch F.A.S.	$130 (unselected for color)
4/4 Birch No. 1 C. & Sel.	80
4/4 Birch No. 2 C	55
5/4 & 6/4 Birch F.A.S.	138
5/4 & 6/4 Birch No. 1 C	95
5/4 & 6/4 Birch No. 2 C	70
8/4 Birch F.A.S.	140
8/4 Birch No. 1 C.	97
8/4 Birch No. 2 C.	70
10/4 & 12/4 Birch F.A.S.	150
11/4 & 12/4 Birch No. 1 C. — Sel.	105
10/4 & 12/4 Birch No. 2 C.	75
16/4 Birch F.A.S.	160
16/4 Birch No. 1 C.	115
16/4 Birch No. 2 C.	85

Maple prices would average from $5.00 to $10.00 lower than the above.

In certain lines, stocks are well up to average, while other items are scarce. On the whole, the stocks of local woods are below the average for this season of the year. In the production end the figures for the winter of 1921 show a startling discrepancy. It is estimated by some, who are in close touch with the woods operations, that the production of softwoods has fallen off from 15 to 25 per cent. and hardwoods from 40 to 50 per cent. There are two reasons for this drop in output. One is that faced with an uncertain demand, in the face of a falling market, the operators did not deem it the part of wisdom to attempt to bring out large stocks on which they might lose money. The other is that the open mild winter, with little or no snow, which we have experienced, has greatly retarded logging operations. In this connection it is likely that many of the small operators, who formerly cut anywhere from 250 M to 750 M, will not produce their usual quota, and those wood users, who have been depending on the smaller sawmills, will have to look elsewhere for part, at least, of their requirements. This is one feature of the lumber situation that many are overlooking.

Imported Woods

The lumber situation might be summed up by stating that there is a feeling in the air that we are just on the verge of better things. The hardwood manufacturers point to the fact that many furniture factories, both in the United States and Canada, which were closed down, have resumed manufacturing on a limited scale, with the probability that production will be gradually increased and that other plans will resume operations. The same holds true in the automobile industry. About 25,000 men were taken on by the various automobile plants in Detroit last week. While this number is only a small proportion of those who were laid off, it tends to indicate the trend of events. The last few weeks have seen an increase in the number of inquiries being sent in and while the buying is extremely light, it is fully expected that the next few weeks will witness a marked improvement and that in another month or two lumber will be moving freely.

This attitude or feeling is reflected to a certain extent in prices, and while it would not be correct to say that prices have stiffened, yet it is felt that they are firmer and that they have been more or less stabilized. In this connection the prediction is made that during the next sixty or ninety days the market will show such an improvement that lumber values will advance on an average of about $5.00 per thousand.

In the producing end there has not been much change. A very small percentage of the mills are running full time, while a few more are operating at part capacity, but the great majority have closed down their plants and taken their men out of the woods. Their attitude is that they do not intend to start manufacturing until the demand improves to such an extent that they will be able to dispose of their output at a price above the cost of production. That time has not arrived as yet. In the meantime the assortment in the different yards and centres is being broken up and stocks are gradually being worn down by attrition or slow buying. It is estimated that an increase in demand amounting to even 40 per cent. of normal would clear out available stocks in short order.

The users of hardwod lumber are in a rather peculiar position for they do not know what the immediate future has in store for them and are therefore not able to estimate their requirements and enter the market. The suggestion might well be made that if a manufacturer figures he will be able to secure business to the extent of $100,000 during the next six months, he should make certain that he has a sufficient stock of lumber on hand to handle such a volume of business. As near as one can judge hardwood lumber will be a very scarce article in the near future. It would appear to be the part of wisdom to cover, at present values, for the possible requirements of spring and summer.

The emery wheel should suit the work to be done. Many wheels caseharden the gullets or burn the teeth. The grade and quality of the wheel is most important.

Small gullets mean slow feeds for the smaller the gullet the greater the resistance of the sawdust.

Information and Inquiries

You are cordially invited to make use of this department

Users of Dimension Stock

Winchester Sta., N.S., Feb. 4th, 1921.

Editor, "Canadian Woodworker"

Will you kindly give us the addresses of some companies using hardwood square stock, from ½ to 3" square, for the manufacture of spools, bobbins and similar turnings.

Your truly,

J. R. Perry.

Would suggest that you get in touch with such firms as: Canada Spool & Bobbin Co., Walkerton, Ont., Industrial Specialty Mfg. Co., Magog, P.Q., Thompson & Co., Sherbrooke, P.Q., Canada Wood Specialty Co., Orillia, Ont., Lachute Shuttle Co., Lachute Mills, P. Q., and the Otterville Mfg. Co., Otterville, Ont.

Upholstery Filling

Brandon, Man., Jan. 26, 1921.

Editor, "Canadian Woodworker"

Will you kindly tell me where I can purchase tow and moss for upholstering.

Sincerely yours,

Wm. Norris.

The Griffin Curled Hair Co., Toronto, handle tow and moss. Have you ever considered the "Comfy" cushions as manufactured by the "Comfy" Cushion Co., Toronto. Cushions of this type are being used by many of the largest manufacturers of upholstered furniture. They are made in different sizes and shapes as required.

Brass Furniture Trim

Vancouver, B.C., Jan. 27, 1921.

Editor, "Canadian Woodworker"

Where can I buy brass fittings in the old designs suitable for antique furniture? Can you tell me where I could get wood carving tools and machinery.

Yours truly,

The Art Furniture Co.

Foster, Merriam & Co., Meriden, Conn., make a line of brass furniture hardware for the different styles of period furniture. No doubt you can secure your requirements from them. Would suggest that you try either Wood, Vallance & Leggat or McLennan & McFuley, both of Vancouver, for the carving tools. Almost any of the machinery firms advertising in this publication can take care of your machinery requirements.

Polishing Wax for Handles

In regard to the enquiry which appeared in the January "Canadian Woodworker" the National Association of Wood Turners, South Bend, Ind., has sent in the following information:

"We are advised that practically the best wax made for fast polishing and drying on hickory and similar wood, is manufactured by the Fasdura Company, 4725 Ridge Ave., Philadelphia, Pa. Also Strahl and Picsch, 141 Front St., New York City are very large manufacturers of waxes."

Fir and Pine Door Panels

Ottawa, Ont., Feb. 5, 1921.

Editor, "Canadian Woodworker"

Will you tell me where I can secure ⅜" panels for doors, in fir and pine. Thanking you in anticipation, I am,

Sincerely yours,

James Hill.

You can probably secure the stock you want from Hay & Co., Woodstock, Ont., Panels Limited, 1100 Queen St. W., Toronto, The Canadian Western Lumber Co., Fraser Mills, B.C., or the Algoma Panel Co., Algoma, Wis.

Table Catches Wanted

St. John, N.B., Feb. 7, 1921.

Editor, "Canadian Woodworker"

Will you kindly tell me where I can purchase table catches, in brass, for small, round, antique mahogany tables. The catch, which is attached underneath, permits the top to be raised.

Yours truly,

W. A. Kain.

The catches you require are out of the ordinary run of furniture hardware and as such are not made by many of the furniture hardware manufacturers. Would suggest that you try the Hahn Brass Co., Limited, New Hamburg, Ont., Andred Thomson, 246-48 Hope St., Glasgow, Scotland, Grand Rapids Brass Co., Grand Rapids Mich., and Birbieker & Rowland Mfg. Co., Waterville, Conn.

Office Furniture Wanted

A London, England concern is desirous of getting in touch with Canadian manufacturers of office furniture who are desirous of extending their business overseas. Name furnished on request. Inquiry No. 2681.

In Market for Office Furniture

A London company with branches at Paris, Brussels, Buenos Aires, Valparaiso and Santaigo are open to purchase office furniture, more particularly roll-top desks, office chairs and filing cabinets. Anyone desirous of going after this business can secure the name of the firm by writing the "Canadian Woodworker," Toronto, Ont. Inquiry No. 2709.

Desire Piano Agency

A firm in London, England, desire to take up an agency for Canadian pianos. If interested write the "Canadian Woodworker" for the name of the company. Inquiry No. 2683.

Useful Piece of Furniture

A model coffin was the most useful piece of furniture exhibited at a fair at Shreveport, La. A negro boy of sixteen, who works in an undertaker's establishment attends a high school, where he made a number of model coffins in the manual training department. He exhibited one at the fair and won three dollars for the most useful article of furniture shown.

A Complete Stock Is the Best Guarantee of Quick Shipment

ADMITTEDLY under present conditions the full assortment of our hardwood yards is not entirely a question of consideration for customers. At the same time our mills have proceeded according to a well conceived plan in the preparation of mill stocks on hand. The thought has impressed itself upon us during the past few months that the urgency of buyers' requirements warranted giving every possible assistance to meet emergency calls.

The only way this could be accomplished was to know that our stock was not only full, but well assorted. This effort has resulted in our being able to offer at present our usual immediate service on shipments of any kind, grade, quantity or thickness of high-grade quartered oak, gum, cottonwood and other standard southern hardwoods.

Our Four Mills Produce 200,000 Feet Daily

News of the Trade

The Beaver Pattern Works, were recently registered in Toronto.

G. M. Cerini, Montreal, P.Q., have been registered as cabinet makers.

The Sterling Woodworker Co., St. Lambert, P.Q., are erecting a new boiler house.

The Maple Leaf Reed & Rattan Co., 80 West Lodge Ave., Toronto, were recently registered.

The plant of G. H. Thomas & Son, London, Ont., carriage makers, was damaged by fire recently.

The partnership known as the Imperial Upholstering Co., Montreal, has been dissolved and M. Fogul registered as the proprietor.

The mattress factory, operated in Hull, P.Q., by J. B. Larose, was totally destroyed by fire. The loss is estimated at $25,000, with no insurance.

The Canadian Reed & Rattan Mfg. Co., Montreal, P.Q., have been reorganized, and R. P. Larocque is now the registered proprietor.

The Columbia Graphophone Mfg. Co. has been granted an extra provincial license permitting them to manufacture in the province of Ontario.

An attractive two-manual pipe organ was recently completed by Warren Bros. of Woodstock, Ont., for the Neepawa Methodist Church.

G. Guyot, Versailles & St. James St. West, Montreal, contemplates erecting a two-storey factory, 64 x 38, to be used as a carriage factory.

The Montreal Upholstered Manufacturers' Association was recently formed to embrace the upholstered furniture manufacturers of Montreal and vicinity.

St. Maurice Paper Co., Limited, Cap de la Madeleine, P.Q., are erecting a new factory 45x285, two-storey, to be used as a machine and pattern-making shop.

Wood-Turning Products, Limited, Fenelon Falls, Ont., have authorized by supplementary letters patent to increase their capital from $40,000 to the sum of $200,000.

Pembroke Shook Mills, Limited, Pembroke, Ont., have been authorized by supplementary letters patent to increase their capital from $100,000 to the sum of $500,000.

The Sydney branch of Rhodes-Curry, Limited, Amherst, N.S., has been taken over by the well-known woodworking firm of Chappell Bros. & Co., Limited, Sydney, N.S.

The Andrew Malcolm Furniture Company, Limited, Kincardine, Ont., have been authorized, by supplementary letters, patent, to increase their capital from $100,000 to the sum of $300,000.

The next meeting of the Canada Manufacturers' Association is scheduled to be held at Quebec City some time during June. It is anticipated that about 200 delegates will attend this year.

The factory of Armand Bastien at Loretteville, P.Q., was completely destroyed by fire. The loss is estimated at $60,000. The lines manufactured included canoes, snowshoes, skis and mocassins.

The Willis-Lee Motor Co., Marysville, Ont., will begin production in the near future. Some 1500 men will be employed. In this connection a model city has been built to house the employees of this firm.

The box factory operated by M. A. Bradshaw at 1483 Chateaubriand Ave., Montreal, was destroyed by fire recently. The loss is estimated at $75,000. About 100 employees are thrown out of work.

The Victoriaville Furniture Co., Limited, Victoriaville, P.Q., are opening a Toronto warehouse. All orders from Ontario and a large part of the western business will be handled from this point. Mr. Alf. Roberts is to be in charge.

The planing mill of Robert Nicholls, Blenheim, Ont., was recently destroyed by fire. The building and machinery is a complete loss. The owner has not decided whether or not he will rebuild. The loss amounts to $9,000.

The partnership known as the Maple Cabinet & Upholstering Works, Montreal, has been dissolved and the Maple Upholstering Works Reg., registered with George Hammerson as proprietor.

Fisher Body Company of Canada, Limited, Walkerville, Ont., have been granted supplementary letters patents authorizing them to increase their capital from $150,000 to the sum of $2,000,000.

The Rhodes Curry plant of the Canada Car & Foundry Co., Limited, situated at Amherst, N.S., is reported to have been disposed of. The name of the new purchaser is not available.

The Conklin Planing Mill Co., Kingsville, Ont., have secured a suitable building in Kingsville, and are fitting it up as a planing mill. They have also started work on a new office building 25 x 33 feet.

The Kaministiquia Lumber Co., Limited, Fort William, Ont., have commenced work on a planing mill and woodworking factory. It is anticipated that part of this plant will be in operation in about four weeks.

The Godue Casket Manufacturing Co., Limited, Sutton, Quebec, have been incorporated to manufacture and deal in caskets, carts, furniture and wood products. Capital $100,000. G. A. Godue and R. Lariviere, both of Sutton, Que., are among the incorporators.

Ottawa Axe & Tool Company, Limited, Hull, P.Q., have been granted incorporation to manufacture and deal in air and water craft, tools and wood products. Capital $100,000. N. D. Lennen, Ottawa, and J. H. Colton, Montreal, are two of the incorporators.

A. E. Wade, Limited, Sault Ste Marie, Ont., were recently granted a provincial charter to manufacture and deal in flying machines, automobiles and vehicles of all kinds. Capital $150,000. G. Shanks and A. E. Wade, both of Sault Ste. Marie, are two of the incorporators.

Reliance Airless Wheel Company of Canada, Limited, Montreal, P.Q., were recently granted a federal charter to manufacture and deal in automobile wheels, trucks and other vehicles. Capital $100,000. Two of the incorporators are F. Ditchfield and D. J. Perrault, both of Montreal.

London Motors, London, Ont., were recently incorporated to manufacture and deal in automobiles, tractors, flying machines and other conveyances. Capital $1,000,000. W. R. Stansell, manufacturer, and T. A. Conley, both of London are two of the incorporators.

The Wallace Shipyards of North Vancouver, have been awarded a contract to finish the two vessels on the ways of the Prince Rupert Shipbuilding & Drydock Co., Prince Rupert, B.C. Work on these two hulls was stopped when tht latter company went into liquidation some time ago.

C. H. Wills & Co., who have opened a factory at Marysville, a suburb of Port Huron, Mich., to manufacture a new automobile, to be known as the "Wills-Sainte Claire," have acquired a site on the Canadian side of the Detroit River near Sarnia, and contemplate establishing a Canadian factory.

The Government of British Columbia is investigating the possibilities of the new turpentine and resin industry with a view to co-operating with the Douglas Fir Turpentine Co. and providing work for a large number of the unemployed.

Rice Lake Canoe Company, Limited, Cobourg, Ont., have been incorporated to manufacture and deal in canoes, sail boats and other water craft. Capital $100,000. H. R. Lansgslow and J. W. Spragge, both of Cobourg, Ont., are two of the incorporators.

A blaze in the factory of the Knechtel Furniture Co., Limited, Hanover, Ont., recently, threatened the complete destruction of this large plant. Prompt action by the factory fire department confined the damage to one section and kept the financial loss down to about $10,000.

Phonograph Sales Company, Limited, Montreal, have been granted incorporation to manufacture and deal in pianos, phonographs and other musical instruments. Capital $49,900. A. Robert and J. O. Craig, both of Montreal, are two of the incorporators.

The Canadian Libby-Owens Sheet Glass Co., Limited, Toronto, are adding some box manufacturing equipment and are in the market for two cut-off saws, two rip saws, one boxboard printing machine, one No. 12-30 and one No. 16-36 nailing machine.

An associated company of the C. G. Anderson Lumber Co., Limited, Toronto, known as the Anderson Miller Lumber Co., Limited, is being formed to take over the hardwood end of the C. G. Anderson Lumber Co., Limited. This new company will deal altogether in hardwoods.

Automotive Products Co., Limited, Toronto, was recently incorporated to manufacture and deal in automo-

Getting Back to "Normalcy" on the Time Basis

These are serious times—serious for the manufacturer who is content to "sit tight" and wait for "something to break." When that something does break, it is then too liable to be the thing that was not expected. And then what?

But these are also serious times for the manufacturer who is not satisfied with waiting—the man who believes in going after things, who knows that normal times are ahead and is doing everything he can to prepare for them. This is the man we want to talk to.

We are getting back to normalcy, and our progress can be helped. How? Production! Time conservation! When you purchase an hour of an employee's time, it is up to you to get it. You are entitled to it, and the employee is willing—even anxious—to give it. Have you done your part?

International Time Recorders, when properly located, check the wasted time between entrance and work-bench.

International Job Time Recorders give you an accurate time cost for each operation the workman performs.

The result—sixty minutes working time for every hour of every employee's time and greater production.

—And a quicker return to NORMALCY.

This is our Card Type Time Recorder —showing a fully Automatic Model. For some factories it is preferable, but in others possibly our Drum Type is better. Which is yours? Let's get together and figure it out.

International Business Machines Company, Limited

F. E. Mutton, Vice-Pres. and Gen. Mgr.

Head Office and Factory

300-350 Campbell Avenuue

TORONTO - ONTARIO

HALIFAX, 44 Granville St. ST. JOHN, 18 Germain St. QUEBEC, 501 Merger Bldg. MONTREAL, 1 and 3 Notre Dame St. OTTAWA, 190 Queen St. TORONTO, 409½ Yonge St. HAMILTON, 228 King St. E. LONDON, 489 Richmond St. WALKERVILLE, 44 Lincoln Rd. WINNIPEG, 227 McDermott Ave. VANCOUVER, 110 Water St.

Also manufacturers of International Dayton Scales and International Electric Tabulators

bile, boats, aeroplanes and ohter vehicles. Capital $100,000. W. E. Summerville and L. A. Richard, solicitors, both of Toronto, are among the incorporators.

The plant of the Woltz Moulding Co., Limited, Toronto, was recently damaged by fire. The blaze centered in the finishing room and is supposed to have been started by a defective wire. The loss is confined largely to the destruction of stock, as the equipment was practically uninjured.

The Kitchener-Waterloo Manufacturers' Association recently held their annual meeting. The Board of Directors for 1921 is as follows: F. S. Hodgins, G. H. C. Lang, G. Valentine, A. S. Capwell, N. M. Davison, E. J. Bauer, R. A. McGillivray, E. W. Clement, J. H. Kennedy, W. E. Woelfle and J. Baetz.

A large quantity of valuable furniture was destroyed in a fire which damaged the residence of Major D. N. Matheson, New Toronto, Ont. This furniture consisted of a number of family heirlooms which have been in the family for generations and which were valued at $40,000. These cannot be replaced.

The Sterling Woodworking & Construction Co., of St. Lambert, Que., whose premises were destroyed by fire on November 20th last, have nearly completed re-building and expect to be in operation by the end of February. This firm will be manufacturing sashes and doors, interior finish and general mill work.

T. B. Rivett, reeve of Niagara township, is endeavoring to organize a company to start a basket factory at Niagara-on-the-Lake. An effort is being made to interest the fruit-growers who were so seriously handicapped by the shortage of baskets last season. Nothing definite has been decided as yet.

Monsarrat Machinery & Foundries, Limited, Riviere du Loup, P.Q., have recently been incorporated to manufacture and deal in woodworking, pulp mill and other similar machinery. Capital $80,000. C. A. Monsarrat and M. H. Monsarrat, both of Riviere du Loup, are two of the incorporators.

The manufacture of furniture in Mexico has made vast strides during recent years. Period styles are being produced from Mexican woods, which compare favorably with the finest products of our best factories. At the present time a large part of the local trade is being supplied by the Mexican plants.

The Bridgeburg Shipyards of the Canadian Allis-Chalmers Co. have been closed down for an indefinite period. This will be a serious blow to Bridgeburg, as the annual payroll of this plant approached the half million mark. The present status of the shipbuilding industry is the reason given for stopping operations.

The factories of the Waterloo Furniture Co., Waterloo, Ont., and the National Furniture Co., Kitchener, Ont., which were recently taken over by E. O. Weber, Limited, Waterloo, Ont., have resumed operations. The Waterloo concern is now working on a piece-work basis, while the National Furniture Co. is working 10 hours a day at the rate paid for 9 hours.

An interesting little book entitled "Industrial Injuries and Their First Aid Treatment," is being distributed with the compliments of the Denver Chemical Co., Denver, Col. This treats with the different accidents which are liable to occur in any industrial plant, and outlines how they should be treated. A copy of this booklet may be had by applying to the Denver Chemical & Mfg. Co.

The new furniture factory of the Langslow's, Limited, H. Lovell & Sons, Limited, Coaticook, Que., have been granted a provincial charter to conduct a general lumber business and to manufacture chairs and other articles of furniture. The company will take over the real estate business of H. Lovell & Sons. Capital, $25,000. Fritz E. Lovell, lumber manufacturer, and A. J. Sparks, lumberman, both of Coaticook, are two of the incorporators.

Cobourg, Ont., is rapidly nearing completion. The equipment is all in hand and is being installed as rapidly as possible. Recently part of the plant was set in operation and about twelve given work. This number will be added to as rapidly as possible. Owing to the present depression the company are receiving many applications for work.

The Associated British Industries of Canada, Limited, recently adopted a new constitution. The Association has been operating branches both in Montreal and Toronto, but it has been decided to operate under one official head so as to secure closer co-operation between the two branches. G. A. Marshall, is president of this organization with Capt. John Harris vice-president, and W. E. Bunny, secretary.

An effort is being made to arrange a joint meeting of the Retail Merchants' Association, the Canadian Manufacturers' Association and the Wholesalers' Association. Should this be brought about, one important question, which would be discussed, is the best policy to adopt in order to assist in the campaign for furthering the sale of Made-in-Canada goods, and also the policy which should be adopted in order to swing the balance of trade back in favor of Canada.

Several of the Owen Sound furniture manufacturers have started their plants again. The Owen Sound Chair Co., Limited and the North American Furniture Co., Limited, are running with reduced staff, employing about one hundred men. The North American Bent Chair Co. recently took on about seventy-five hands. It is anticipated that the demand for furniture will gradually increase and that it will not be long before these plants are operating with full staffs.

Announcement was made in a recent issue of the "Canadian Woodworker" that the Canada Barrels & Kegs, Limited, Waterloo, Ont., had been incorporated with a capital of $500,000, to take over the cooperage business known as the "Chas. Mueller Co., Limited," Waterloo, Ont. The officers of the new company are: President, E. F. Seagram; 1st vice-president, T. W. Seagram; 2nd vice-president, Norman Seagram; general manager and secretary-treasurer, Leo Henhoeffer; assistant secretary-treasurer, J. B. Salm.

Certain of the large B.C. mills recently lost a good order for box shooks because they could not or would not meet the prices quoted by their American competitors. The order which was for 5000 tons of box shooks, was offered to Vancouver first, as the Australians preferred dealing with Canada if they could get as good a price as the United States mills offered, but the British Columbia mills refused to accept a loss on high-priced logs of last summer and fall markets, despite the fact that logs are now much cheaper.

M. S. Snyder, manager Waterloo Broom & Brush Co., recently stated that it is extremely unlikely that the price of brooms will go any lower. There is a shortage of corn which means that the price of this material will be maintained, while the advance in freight rates has hit the broom manufacturers both coming and going. The price of handles advanced about 75 per cent. during 1920, and has declined only about 10 per cent. It has been intimated that prices on all lines of broom handles will advance in the near future. Taking it all around, it is hard to see how broom values can be lowered to any extent.

The plant of the Beamsville Basket & Veneer Co., Beamsville, Ont., was recently destroyed by fire. The loss, which is a heavy one, amounts to $40,000, and was covered only to the extent of $11,000 by insurance. The orders on hand have been distributed among other Ontario basket factories so that the fruit growers in its district will not suffer any inconvenience because of a shortage in baskets. A. W. Reid, Jr., son of the owner, is responsible for the statement that building operations will be commenced at as early a date as possible, and it is hoped that the new plant will be in operation some time in July.

The woodworking plant recently completed at Upper Cross Creek, N.B., by Gordon C. Scott, was entirely destroyed by fire. The loss amounts to $25,000, with $6,000 insurance. This plant was formerly a sawmill, but had just been remodelled and equipped with box-making and shingle-manufacturing machinery. Operations were to have started the day of the blaze. The owner has decided to rebuild and it is expected the new plant will be completed and in operation by May 1st. In addition to a complete line of box-making equipment, Mr. Scott contemplates installing shingle-making machinery, together with four rossers.

Personals

S. F. Rutherford, managing director of the Dominion Box & Packing Company, Limited, Montreal, has been elected an alderman for the City of Westmount, P.Q.

R. A. Laidlaw of the R. Laidlaw Lumber Co. (Ltd.), Toronto, lumber dealers and general woodworkers, and Mrs. Laidlaw left recently on a visit to China. They expect to return about April 1.

A. K. Johnson, Toronto, Ont., has been appointed Canadian representative for Mowbray & Robinson Co., Inc., of Cincinnati, Ohio, manufacturers of hardwood lumber. Mr. Johnson recently returned from a trip to Cincinnati, where

One reason why our Gum is Straight and Flat

Do You Know

"That you can get Gum Lumber that is **free from stain and as bright as a dollar?**

"Always thought the sap part of Gum must be discolored, didn't you? Some boards black, some a lighter shade, a few bright—**all lacking uniformity?**

"Oh! of course, the inspection rules say "stained sap is no defect," **but what do you say Mr. Manufacturer,** you who have to **cut up, work and finish the lumber?**

"We have never believed that a manufacturer of furniture, trim, finish, etc., could satisfactorily use Gum lumber in the shape it is generally put out, and we, therefore, set out to **eliminate** the **objectionable features** we have mentioned.

"Have we succeeded? **Unqualifiedly yes.** Nothing left to chance, **no guess work.**

"Every board of our KRAETZER-CURED Sap or Quarter Sawn Unselected Gum **is bright,** with a slight pinkish tinge closely resembling cherry, and **uniform throughout.**

"And it's straight and flat too, **that's another thing we've done.**

"Get acquainted with our kind, **you'll never be satisfied with the other kind again.**

"Costs only a little more in the beginning and **the final cost is less, very much less** and oh! the **satisfaction, the freedom from trouble and worry.**

"Don't be deceived by misrepresentations. Insist on the genuine. Every board bears our trade mark.

he familiarized himself with the manufacture of the different woods.

C. O. Maus of the Hyde Lumber Co., South Bend, Ind., has written to a number of his friends in Toronto, stating that his company has decided to absorb the exchange on all new business in connection with Canadian trade.

George C. Heintzman, Toronto, of the well-known firm of Heintzman & Co., piano manufacturers, recently won the gold championship in the annual South Florida Golf title tournament, which was played on the Palm Beach Club green.

Frederick Arnold Farrar, who, for the past fourteen years, has directed the advertising of the Adams & Elting Co., Chicago, Ill., manufacturers of finishing materials, has been appointed advertising director for the Greater Glidden Co. He will continue in charge of the advertising of the Adams & Elting Co., as well as look after the publicity of the other divisions of the Glidden Company.

Obituary

Alex. Tisdale, a well-known boat builder of Belleville, Ont., recently passed away.

Napoleon Piche recently passed away at his home in Sandwich, Ont. Mr. Piche was a partner in the firm of Piche & Genet, carriage builders.

George Morrisette, Granby, P.Q., was recently killed in the plant of Wilfred Charron. His death was caused by the breaking of a shaft permitting a heavy pulley to fall, striking him on the head.

John Smithson, Collingwood, Ont., recently passed away. Mr. Smithson conducted a cooperage at Thornbury for a number of years and latterly moved to Collingwood where he took charge of the keg mill of the Imperial Steel & Wire Co., Limited.

Canadian Toy Industry Unequal to Demand

Although the toy and doll industry of Canada has made considerable advance compared with pre-war times, it would appear from official statistics that the domestic demand is by no means fully met by Canadian factories, for the Dominion's imports of toys and dolls during the fiscal year 1913 amounted to $939,678 and during 1920 to $1,534,728.

The kinds of toys manufactured in Canada include animals, autos, balls, billiard games, boats, building blocks, carriages, crockinole boards, croquet sets, dishes, dolls' furniture, games garden sets, lawn swings, pool tables, pucks, rocking horses, skipping ropes, sleighs, teeters, toy balloons, tricycles and wheelbarrows, which are made of celluloid, chamel, iron, steel, tin, rubber and wood. The growth of the Canadian industry is principally due to conditions arising out of the war, and at the present time some thirty-five toy factories are listed, although the census returns report the operation of only fifteen in 1918—the latest year for which figure are available. These fifteen factories represented a capital investment of $369,219 in 1918; they employed thirty-three salaried workers and 193 wage workers, to whom they paid, respectively, $44,190 and $131,817; they used materials costing at the works $115,329 and turned out products whose selling value at the works was $405,369.

As already stated the Dominion required in the lasts year an additional $1,500,000 worth of toys to supplement the output of Canadian factories. Before the war Germany was the chief source of supply, but the United States now occupies first place, and Japan, likewise, has made a notable advance in its shipments of toys.

When there is a blue haze and a smell of smoke around a saw bench it is a sure sign that the saw teeth want grinding fairly hard on the front.

Planing mill on the Canadian National Railways, between Levis and Mont Joli, doing a Milling in Transit business, with work ahead guaranteed for several months at profitable prices. Fully equipped with Planer, Sticker, Resaw and Ripper, handling several cars daily, with siding capacity of nine cars, right in the heart of lumber section of this Province, where more than ten times mill's capacity has been refused during the past year. Mill built of Cement with Cement Floor, Asbestos Roof, with additional buildings for Sash and Door factory or box factory, and sheds for piling dressed lumber, also with piling ground for about half a million feet of lumber. Price $30,000.00 on terms that will be satisfactory. A live man or group of men can easily clean up $2,000.00 per month net profit, and mill can be extended for increased business very easily. Principals only. If interested write to Box 106, Canadian Woodworker, Toronto, Ont. 1-3

Walnut Maufacturers to Continue Publicity

The annual meeting of the American Walnut Manufacturers Association was held at the Association offices in Chicago on Thursday, January 20. The point of principal importance is the decision to continue publicity in behalf of walnut. The decision was based on the very satisfactory record made by the campaign during the past years. Members were much gratified by the apparent public interest in walnut manifested directly through the increasing showing of walnut goods at the furniture market at Grand Rapids and Chicago. The efforts of the Association to increase interest in walnut have centered largely about the necessity for convincing the public that the walnut supply is adequate to meet present and future requirements. Already the growing call for walnut furniture has resulted in quite extensive installation of walnut interiors in pretentious public buildings of all kinds.

By-Laws
Noble Order of Gloom Chasers
Long-Bell Conclave

1. The purpose of this organization is the elimination of Old Gus Gloom.
2. The membership is limited to one hundred million, that being a conservative estimate of the population of this country at the time of writing.
3. Any man, woman or child, with eyes to see signs of prosperity and ears to catch a note of optimism, is eligible to membership, and becomes a duly accredited Gloom Chaser upon signing the regular membership blank and thereby promising actively to support the order and its intent.
4. Note the Word "active." From the moment of swearing "So help me Gloom Chasers," a member in good standing must chase gloom wherever he meets it—whether it be on the street, in office or workshop conversations or by grace of the stranger that is within thy gates. Further, he must promote the movement by giving to his official publication, or to local newspapers, any signs of prosperity he may see or hear.
5. Any member failing to carry out the above provisions is liable to the extreme penalty—to be swallowed by .gloom .and .plunged into eternal gloominess—or to be suspended for an indefinite period from fellowship with brother Gloom Chasers, or to be punished as his local conclave may direct.
6. Any member seen in company with Old Gus Gloom, upon whatever pretext, may be suspended for an indefinite period.
7. Any member acknowledging membership in or relations with or sympathies for any pessimists' club, gloom club, sob society or other movement with similar purpose hereinbefore or hereinafter organized may be taken before a firing squad armed with the poisonous gasses of pessimism at any beautiful, optimistic sunrise and summarily dealt with as hereinafter prescribed.
   (a) The fallen brother shall listen for half an hour to a reading from the Pessimists' Handbook, after which shall be played a funeral dirge. He shall be blindfolded so that by no chance will he see nature's optimistic face. So that he may contaminate no other person or thing he shall be caused to cry aloud, "I am the leper of pessimism," and the gibes of all true brothers of the Noble Order of Gloom Chasers shall greet his cries.
   (b) Only upon proper penitence and promises for the future shall this fallen brother be reinstated.
8. The dues for membership in daily activity as the conscience of the Gloom Chaser may dictate. There are no paid-up memberships. The dues are never paid. Look at each day and chase its gloom.

Keeping Water in Barrels from Freezing

While the use of water barrels and buckets may possibly not be the best and most efficient method for fire protection, nevertheless there are places where such equipment offers the only practical means of safeguarding a plant from fire. In getting the barrels ready for the winter they should be overhauled and put in good condition. In the first place it is best to use all-wood barrels with wood hoops,. as metal barrels, or wood barrels with metal hoops, give out very quickly under the corrosive action of the chemicals used to lower the freezing point of the water. It is an excellent precaution to paint the barrels well inside before they are used in the fall, and in fact this is necessary where calcium chloride is used to prevent freezing. In sections where temperature of only a few degrees below zero, Fahrenheit, is to be expected, sodium chloride, or ordinary salt, will give satisfactory results. Where very much colder weather is expected, calcium chloride can be used to good advantage and is not very expensive. Both sodium chloride and calcium chloride should be dissolved in the water before putting the solution into the barrels, as it takes considerable physical exertion to dissolve the salt, especially as the solution nears saturation. The following table gives the amount of calcium chloride and sodium chloride to use and the approximate temperature at which the solution may be expected to freeze:

Amount in pounds per gallon of water	Degrees below zero (F.) when calcium chloride is used	Degrees below zero (F.) when sodium chloride is used
½	20°	29°
1	27°	18°
1¼	25°	15°
1½	23°	12°
1¾	21°	9°
2	18°	6°
2¼	14°	3°
2½	3 to 4°	-1°
3	-8 to 4°	-3°
3½	-8 to 11°	*-8°
4	-17 to 19°	...
4½	-27 to 29°	...
5	-39 to 41°	...
5½	-50 to 54°	...

*At 3½ pounds to the gallon the sodium chloride solution becomes saturated and it is useless to add more sodium chloride.

Woods Used for Toys

Wood holds its high place in the toy industry, not because it is so much cheaper, but because articles of large size would be too heavy if made of metal, and if of sheet metal, there is danger that the rough edges would cut the hands of the children. Many articles such as sleds, are made of wood because it is the best material, irrespective of cost or weight.

An idea of the amount of wood used annually for toys in the United States is given in the following table:—

	Feet Used
Basswood	8,739,242
Maple	3,964,400
Beech	3,221,506
Birch	3,221,506
White Pine	2,367,131
Elm	2.042,055
Oak	1,444,057
Chestnut	966,268
Ash	895,300
Yellow Poplar	882,000
Red Gum	523,000
Cottonwood	257,000
Hemlock	241,000
Cypress	150,000
Sycamore	91,343
Butternut	10,000
Tupelo	5,000
Cherry	2,000
Spruce	1,300
Total	28,926.552

This comparatively large consignment of wood might be quite a drain on our forests if it were not for the fact that much of the wood used in toy-making would be scrapped if not employed for this purpose. Toy-making is a good means of utilizing waste products.

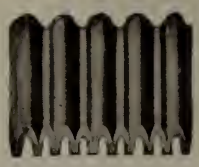
Cary's SUPERIOR QUALITY Corrugated Fasteners



SAW EDGE

PLAIN EDGE

According to final decision, after long litigation, we have been granted the SOLE RIGHT to manufacture a Saw Tooth Corrugated Fastener with a continuous cutting edge. Our fastener is beveled evenly on both sides, which enables fasteners to be driven in straight, and much easier than any other fastener made. Our Corrugated Fastener is made in various widths and corrugations, also in coils wound right and left. Try our products and you will use no other.

Samples and prices on request.

"Well, I *Guess* So"

The Productimeter

It depends on how well you guess. But you're apt to waste a lot of time and money if you guess when it's so easy to know.

Use the Productimeter on your moulders, matchers, stickers, self-feed rip saws, etc. It works automatically—measures every foot of lumber that passes—doesn't guess—can't skip—won't "lay down" on the job.

Send for catalog. Or tell us what machine you want to check up on and we'll send you the Productimeter on 30 days' trial.

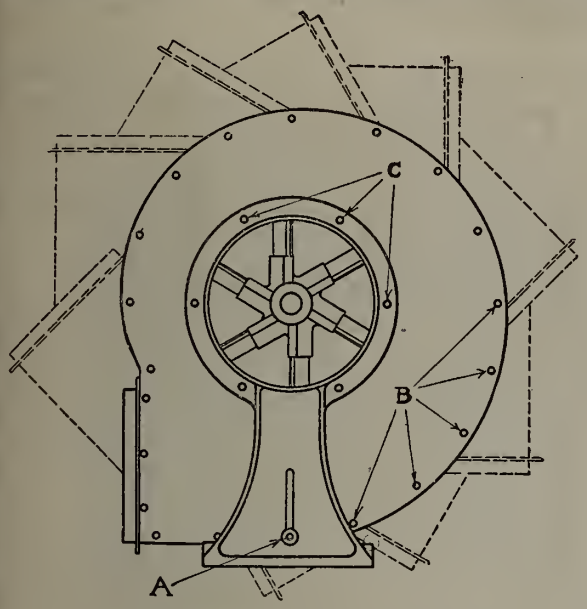
Reversible Housing



One of the features of the Canadian Planing Mill Exhauster is the reversible housing. It is easily adjustable to either hand and to any discharge.

By this arrangement one fan may be used to meet all requirements, thus eliminating crossed belts and sharp angles.

Let our engineering department help you plan your refuse exhauster system.

Write for catalogue 400-13.

Uniformity in Drying Conditions
is a Very Important Requisite in

DRY KILNS

Temperature of wet and dry bulbs should be maintained in substantially the same relation all over the kiln.
A variation of 5° will produce as much as 14% difference in humidity, when high humidities are being carried.

NATIONAL ENGINEERS HAVE SOLVED THIS AND OTHER DRYING PROBLEMS.

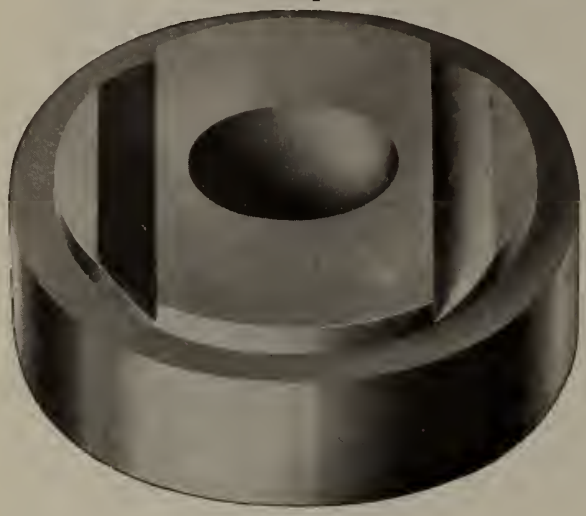
THE SHAPER MAN'S DREAM

THE KNOUREK PATENT

Ball Bearing Shaper Guide Collars

A Decided Improvement Over the Revolving Solid Collars Now in Use



Patent applied for

Ball-bearing Shaper Guide Collars are made with grooves as shown, for flat knives, and without grooves for solid steel cutters.

ORDER A SET ON 30 DAYS FREE TRIAL

The friction set up by stock or patterns bearing against solid revolving collars is entirely eliminated when ball-bearing shaper collars are used. Every shaperman knows the effect of this friction on stock being run, and so will appreciate the real value of these new shaper collars.

In the operation of the ball-bearing collar, the outer shell is free from the slotted collar proper and ceases to revolve with the spindles when pattern or stock comes in contact with it. It does not stop entirely but simply rolls along with the feed of the work. In this way there is no friction whatever between the collar and the work, therefore the edge surface can neither be burned nor worn down.

To save your patterns, stop spoilage of stock and in an easy manner, enable your operator to do more work, you should try out these new ball-bearing shaper collars —note the results by actual operation in your own plant.

62 & 64 Temperance Street

TORONTO - - ONTARIO

Carborundum Brand Garnet Products Make Good with the Men

"It's up to the men and they seem to want Carborundum Brand Garnet Products. If we give them something that doesn't do the best work we soon hear of it."

So says the general manager of a live, busy Western New York furniture plant.

His men think pretty well of Carborundum Brand Garnet Paper and Cloth.

For instance, G. D. Danielson, foreman, says of that flexible belt he is using for sanding gumwood table supports—

"Mighty good stuff. Will by far outlast and cut a whole lot more than any cloth I ever used."

You get the same story all through the plant. The men appreciate what it means to work with such uniformly clean, quick-cutting, long-lived paper and cloth. So will the men in your plant.

MORGAN
NAILING MACHINES

Are built strongly for heavy continuous service. Machines adapted to all kinds of special nailing.

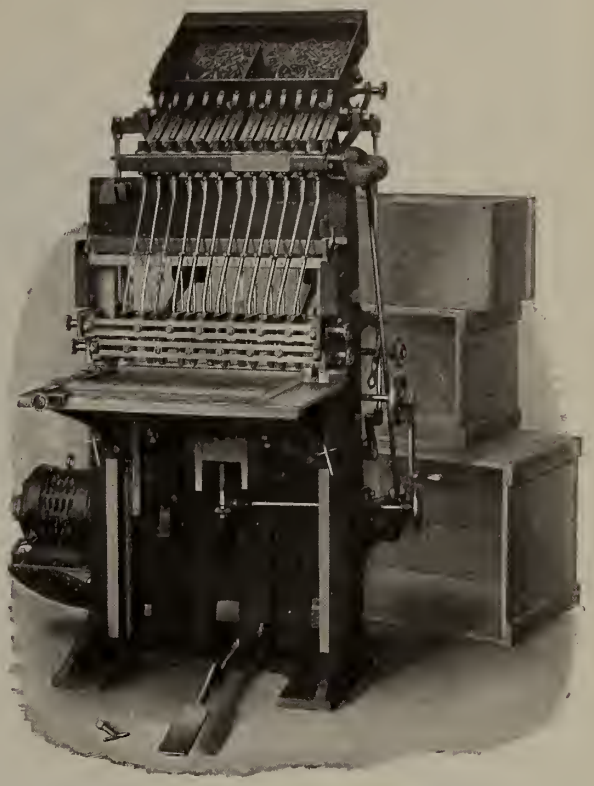
Regular machines for all sizes of boxes and crates.

Write us for descriptive literature.

Machines that save money

Morgan Machine Co.

DEPT. A ROCHESTER, N.Y.



Morgan No. 12-30 Open Back Nailing Machine, Fitted with motor.

You Can Use This to Advantage
The Olson Frame Extension

Increase the carrying capacity and therefore the usefullness of your Ford Truck by the addition of the Olson Frame Extension.

Particularly adaptable for the transportation of lumber and furniture for either short or long distances.

The perfect balance of the Olson makes smooth and easy running—a desirable feature when easily broken articles are being carried.

Our nearest branch will be pleased to send you fullest information.

One Man Does the Work of Two
with a Billstrom Glue Clamp Carrier

For every plant where much edge-gluing is done there is a real need for a Billstrom.
Here's why:—

The empty clamp is held at just the right height for the greatest convenience of the workman.
When the clamp is filled he pulls a cord, which carries the filled clamp away and deposits an empty one in its place.
One man can accomplish as much by using it as two men can do employing the old methods.
It holds the work off the floor until the glue has set, when the glued stock can be quickly removed and piled flat, thus greatly conserving space.
It reduces the labor and cost of edge gluing to the minimum.
There is a sizs to suit your particular requirements.

N. J. BILLSTROM
2002 NINTH ST. ROCKFORD, ILL.

44 Yates No. 275
36 and 66-in. Automatic
Knife Grinders,
Brand New, at
One-half Price

Machines arranged for Motor Application as per cut, or regular belt drive, if wanted.

We have in Cincinnati, available at once, three Whitney 30-in. single surfacers and two Whitney 30-in. double surfacers, all with sectional rolls; three double arbor revolving saw tables; three single arbor tilting table saw benches; F.&E. single-end tenoner with roller table, and a few other choice machines. All are in exceptionally fine condition—are doing precision work at the present time.

Matcher, American Northwest, 24x8-in., 3 sides.
Matcher, 24x6-in., 3 and 4 sides.
Molders, 4-side, 9, 10 and 12-in. American.
Molder, Fay & Egan, 12-in. outside, heavy.
Mortiser, chain saw, New Britain No. 7, new.
Mortisers, F. & E. vertical, hollow-chisel; also plunger type; Greenlee vertical, double hollow-chisel.
Nailers, two, Hayes, 8-track, 8d, closed back.
Nailing machines, 2 closed back, 4-track, 4d, 15-in. spread, Hayes' make.
Pony planers, 16, 20 and 24-in.
Rip saws, self-feed, Hoosier, F. & E. Greenlee.
Rip saw, gang, Luther, for box work.
Router for stair stringers.
Sand belt, closet seat and similar work.
Sander, H. B. Smith, spindle and disc, practically new.
Sanders, 30- 42 and 54-in. Columbia; 30, 42 and 48-in. Invincible; 30 and 36-in. F. & E. double.
Saw, 8-ft. double cut-off, roller table.
Saws, combination and variety, single and double arbor, also tilting arbor, stationary and tilting table, 24 and 30-in. circular resaw.
Saw, circular re-slab, 40-in. blade, power feed rolls.
Shapers, Fay single-spindle reversible, also Shimer single with overhead routing attachment.
Shaper, Whitney No. 7 and 8 double-spindle, practically new.
Surfacer, 30-in. double, cabinet, B. & M., practically new.
Surfacer, Whitney 30-in. double, sectional roll and sectional chipbreaker; American No. 4¼, 36-in. sectional and solid; Fay & Egan No. 140, 27 and 30-in. double divided rolls; also 18, 20, 24 and 30-in. single cylinder panel planers.
Tenoners, Fay & Egan double-end, also single-end.
Window frame machine for production work, new.
Window frame machines, Smith & Phillips combination.
Wood-worker, universal, Fay & Egan and Bentel & Margedant. One lot of glue room machinery.

We have just received two carloads of Band Saws and Jointers—all new—which are ready for immediate delivery.
Band Saws, 20, 26, 32, 36 and 38-in. Jointers, 8, 12, 16 and 24-in.

More *than* Economy *and* Speed

A Battery of "Automatics" at Stickley's, Grand Rapids

THE Mattison Automatic Shaping Lathe produces turnings much faster and cheaper than is possible with hand methods or with old style machine equipment.

BUT of even greater importance is its flexibility which gives your designer free play in creating his designs. It faithfully reproduces all the historic round, square and octagon turned work, which plays so important a part in the new, distinctive patterns of today.

MATTISON
Automatic
The Standard Shaping Lathe
OVER 3000 IN USE

If it is worth while to bring out new patterns, isn't it just as important to give equal consideration to the best and most economical method of producing those patterns?

Model 1-D Portable Drill

HANDY—ECONOMICAL—EFFICIENT

Specifications:

Length—10 inches.

Weight—4¾ pounds.

Capacity—Steel, 0 to 3/16". Wood and alloys, 0 to 1/4".

Motor—Universal, on either direct or alternating current.

Diameter of Motor—3⅜ inches.

Spindle—Offset from center 3/32".

Helical Gears.

Aluminum Handle.

Complete with 10-ft. cord, plug, switch and chuck.

Jacob's Chucks used as a regular equipment.

FOR speed in drilling and countersinking small holes, this tool is just what you need. It can be used on any kind of material—steel, iron, brass, aluminum or wood—and gives lasting service.

If your dealer cannot supply you with the Model 1-D, tell us about your requirements.

DUMORE GEARED ELECTRIC DRILLS

FIRST CLASS MECHANICS

used these tools in a plant operated by large departmental store for manufacturing high grade fixtures; these

Machines are in the Best of Condition

and are offered at prices which are sure to interest you now that business is showing such a pronounced improvement.

1—McGregor-Gourlay Double Arbor Universal Saw Table, same as C.M.C. No. 618, with 14″ saws, self-contained countershaft, full complement of gauges, saws, wrenches, etc.

1—Ditto as above.

1—Preston No. 127 Variety Saw Table, countershaft attached, one 14″ saw.

1—Ballantine 36″ Band Saw, with solid lower wheel, complete with saw blades, wrenches, etc.

1—Ballantine Two Spindle Shaper, Spindles 20½″ centres, diameter of spindles where collars go on 1⅛″, top 42″ x 42″.

1—American No. 1 Single Spindle Shaper. Fig. 937 with plain countershaft.

1—C. M. C. No. 507 Mortiser, with boring attachment.

1—C.M.C. No. 624 Hand Feed Rip Saw Machine, with self-contained counter shaft, table 6′6″ long by 40″ wide, with plain box gauge, 22″ saw blades, 1¼″ arbor with cone for receiving saws different diameter.

1—Ballantine 8″ Four Sided Moulder, complete with square heads and straight knives on all heads.

1—American No. 2½ Single End Tenoner, with two copes and cut-off saw attachment. Fig. 9431 in American Woodworking Machinery Catalog.

1—Ballantine 16″ Buzz Planer with square cylinder, full set of knives and countershaft.

1—C.M.C. No. 646 Roller Table Cut-off Saw, sliding table 7′6″ long, stationary table 50″ to the saw, sliding table equipped with stop gauge, including five stops, with countershaft, complete with saws, wrenches , etc.

1—Yates No. 156 27″ by 6″ Single Surfacer with solid roll and chipbreaker, full set of knives, wrenches and countershaft.

1—Cowan Combination Vertical and Horizontal Boring Machine, complete with wrenches, etc.

1—Wood Frame Belt Sander, complete with roller table.

1—Hespeler 12″ Buzz Planer, fitted with round cylinder, full set of knives, countershaft, wrenches, guard, etc.

1—Ballantine Tilting Table Double Arbor Saw Table, same as C.M.C. No. 616, arbor raising and lowering, fitted with full set of gauges, countershaft, saws, etc.

1—Preston 36″ Band saw, lower web wheel and guards.

1—McGregor-Gourlay Variety Saw Table with countershaft attached, guard, gauges, tilting table, wrenches, etc.

8—Sections Cowan Four Screw Veneer Press 12″x50″, four sections 27″ clear space under screw plates, four sections 32″ under screw plates.

1—24″ Francis Double Roll Glue Spreader.

4—Sections Cowan Three Screw Veneer Press 38″x12″, 28″ clear space under screw plates.

1—American No. 4½ Single Surfacer, with solid roll and chipbreaker.

1—American No. 26, 10″ Outside Moulder, 4″ side heads, latest type machine, complete with knife jointers and all equipment, new straight knives on all four heads.

1—C.M.C. Arm Sander, No. 438, with paper cutter.

1—Universal Knife Grinder, 37″, made by American Wood Working Machinery Co., Fig. 1126 in their catalogue.

1—60″ Sturtevant Single Slow Speed Exhauster, left hand, top vertical discharge, complete with platform and rods to suspend from ceiling.

1—Pair 24″ Pulleys.

1—18″ Filing Vise.

1—Foley Band Saw Setter.

The last three items for use in sharpening small size Band Saws.

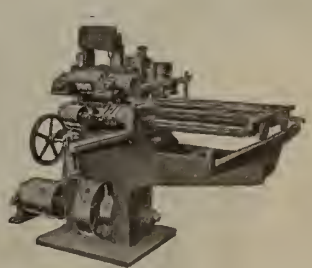
Garlock-Walker Machinery Co., Limited

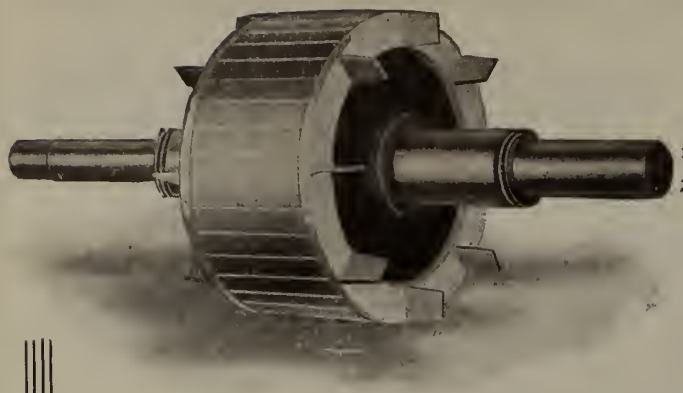
32 Front Street West

WINNIPEG TORONTO MONTREAL

Everything in Woodworking and Metal Working Machinery



American No. 2½ Single End Tenoning Machine



No Soldered Joints or Bolted Connections in

Canadian Crocker - Wheeler Rotors

The greatest improvement in modern induction motor design—no soldered joints to melt and cause arcing or open circuits and no bolted connections to work loose. The risk of fire as well as the possibility of motor troubles and consequent delay, is thus greatly reduced if not eliminated entirely.

¶ The entire Rotor Winding of small squirrel-cage induction motors is cast of aluminum alloy—in one operation. Thus, the complete winding is one integral structure.

¶ The medium and large size Rotors have liberal section copper bars and the end rings are cast-welded, making perfect contact.

The generous bearing sizes and sturdiness of mechanical construction throughout, further emphasizes the superiority of our motors for woodworking plants.

A New Edge Sander

The Invariable Choice Yates Of the Man Who Knows

TYPE S-2

This New Edge Sander has been constructed only after a careful study of the field in which it is to find its usefulness.

This Sander possesses all the good features of other makes in addition to having advantages over them.

Here is a new machine Sander users should know about. Let us acquaint you with its sanding possibilities. We will gladly do it without any obligations on your part.

P. B. Yates Machine Co. Limited

Hamilton - Canada

No. 140-A Surfacer will set New Standard for Production and Grades in your Mill and Factory

No. 140-A Patented Double Cylinder Surfacer

No. 351 Automatic Feeder

Furniture manufacturers are quick to realize that a wonderful finish invariably sells the furniture. No. 140-A whether used for general surfacing or the finest smoothing work will set new standards for production costs and grades in your mill or factory.

No. 140-A is especially valuable to concerns which do not buy the highest grade of lumber, as it will finish this low grade stock perfectly, not tearing out even when working knotty or cross-grained stock.

Exclusive Fay & Egan construction features, make this machine a fine investment from the standpoint of initial cost, power and up-keep expense, and results.

Send for our special Bulletin B-12 for full information.

ESTABLISHED 1830

World's Oldest and Largest Manufacturers of Woodworking Machinery

153-173 West Front Street, Cincinnati, Ohio

The "Shimer Limited" Expansion Head

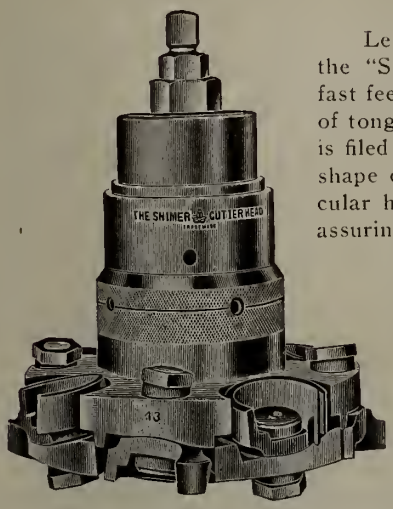

Fig. 627

Let us draw your attention to the advantages of using the "SHIMER CUTTER HEAD" for general Mill and fast feed Planer work. The Cutter is turned to cut the shape of tongue and groove desired, so that to sharpen the cutter it is filed or ground on its face, guaranteeing the user the same shape of cut during the life of the cutter. The bit being circular has from 3½ in. to 5 in. cutting length to the cutter, assuring long wearing life to the cutters.

Note that the cutter, being fastened to a concave seat on a compound angle, assures the user of the proper clearance of cutters, consequently they never burn.

These heads are fitted with or without the Self-Centering Sleeve, and made Expansion or Solid, to suit the customer's wishes.

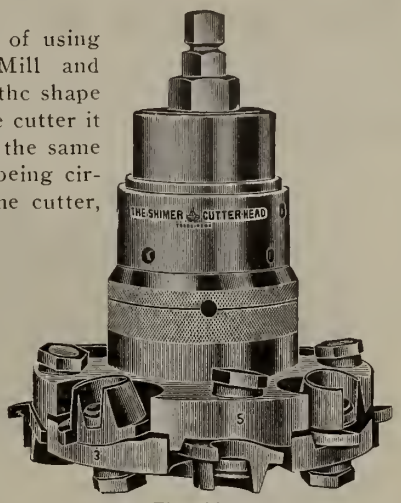

Fig. 268

Shimer Heads have been in use for sixty years, and their reliability and reputation have spoken for them in the past. Let us know your wants and we will guarantee their reliability at the present.

GALT, ONTARIO

Magazine Fed Screw-Driving

Reynolds' No. 2 Standard Type Machine

This MEDIUM size Reynolds will magazine and drive without change or adjustment three consecutive sizes of wood or machine screws from No. 6 to No. 14 inclusive. If smaller than No. 10 up to 1½" long; No. 10 to No. 14 inclusive up to 1¾" long. Quickly interchangeable sets of parts can be furnished at slight cost to increase the range of screws driven.
Will drive screws to the center of an 18" circle in work not over 19" high. For use on work requiring greater depth of throat, such as attaching hardware to Cabinet Doors, Closet Seats, etc., Gap Column may be substituted, allowing screws to be driven to the center of a 48" circle in work not over 6" high. Below the Gap the Machine has same depth of throat as Standard Machine (9").
Automatic Stop may be furnished when desired.
Boring Attachment furnished where necessary to bore before driving screws. (Either single spindle or cluster head.)
Pulleys tight or loose 8" diameter for 2½" belt.
May be equipped for individual motor drive. Any Standard Electric Motor furnished at list price.
Spindle Speed 700 to 850 R.P.M. Pulley Speed 450 to 550 R.P.M.
Power required from one to two horsepower.
Table Size 14" x 24". Base Size 16" x 20". Height 6'7".
If you want to cut down labor costs in the screw driving department by 85% instal this machine at once.

Chapman Double Ball Bearing Co. of Canada

Limited

TORONTO - ONTARIO

They'll fit your present hanger frames

They Save Their Weight in Gold

This is not said for effect—it's a fact.

If you took the actual bearings in a Chapman Double Ball Bearing, and weighed them against the amount of money in gold that you would save by using them in place of the old-style babbitted hanger bearings, or roller bearings, the two would balance.

The saving works out from 15% to 40% of the power used, when running under full load. If you are using 100 h.p. at $30 per h.p. a year, that fixes the saving at from $500 to $1,200 a year.

You can buy quite a lot of gold for that.

We use this simile to stimulate your imagination sufficiently to inquire into the utility of Chapman Ball Bearings.

If you do inquire, we'll sell you also by an appeal to your reason.

"You pay for them whether You buy them or not."

It's the Uniform Swaged Tooth that Gives Results

With each tooth a cutting point, the strain of the teeth being equalized on each side, the saw can be fitted to take out less kerf, cut straighter lines, stand up to greater feed, cut smoother and last longer with less refitting.

A Simple, Practical Machine
For Fine Accurate Work

No. 125.—TILTING TOP SAW TABLE

Frame Cast in One Piece. **Easy and Rapid Adjustment of Saw.**
Special Locking Device. **Belt Tightening Bushes on Countershaft.**
Arranged for Individual Motor Drive if Desired.

This Engraving represents a new Rip and Cut Off Saw Table, a medium sized machine, convenient for Dadoing, Grooving, Rabbeting, Mitreing, Bevelling, Etc. It is intended especially for fine and accurate work on Furniture, Sash and Door, Cabinet, Pattern and General Woodworking Shops. The design is simple and practical and the construction is high-class throughout.

The Frame is cast in one solid piece making it rigid and strong. The Table is planed perfectly true and has a removable wood throat plate allowing extra thick saws or Dado Heads to be used. The machine will carry saw blades up to 14" diameter.

A Boring attachment or a Boring and Mortising attachment with a wood table, can be furnished with this machine, if desired.

Eaglesfield "BELTLESS" SWING SAW

Announcing——

A new design with special high-torque small-diameter

MOTOR DIRECT ON ARBOR

In addition to the present type of EAGLESFIELD BELTLESS SWING SAW, motor gear-connected, which was put on the market in 1919, we now announce a new design, with motor mounted directly on 2-in. spindle—gears entirely eliminated.

With ample power for saws up to 24-in., this new design permits a range of cutting from the small shop requirements up to heavy-duty service in car shops and saw mills.

Motor connection takes up only 3½ in. of saw, leaving ample clearance—as on a 24-in. saw, 8¼-in. cutting surface is available. Saw can be trammed for more accurate cutting than you have been accustomed to.

The unified hanger construction, resilient spring action, and the 7-in. section column are identical with the gear-head machine.

Motor is of the enclosed, built-in type, 25 or 60-cycle, 2 or 3 phase, any voltage. Extra large size S K F ball bearings. Saw up to 24-in. included in equipment.

Made in Canada

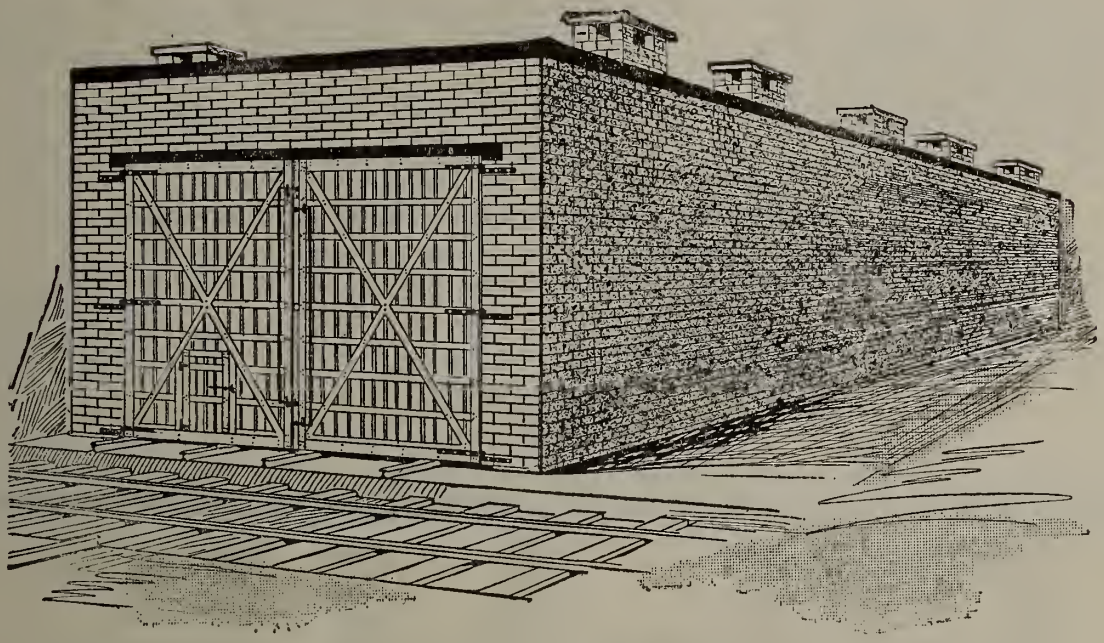
Cutler TRADE MARK

One Kiln Does the Work of Two



Mechanical Principles

The patented mechanical construction of the Cutler Kiln is new in the sense that it is not generally known, but it has been thoroughly tested in actual service for many years. There are no other kilns which have the following valuable features:

1. Even distribution of temperature and humidity in all parts of the kiln.
2. Drying conditions absolutely independent of outside weather conditions.
3. Simple and quick control of the drying conditions inside the kiln.
4. Circulation of every cubic foot of air inside the kiln from 2½ to 3 times per minute.
5. A moisture removing means that does not require condensing coils or the introduction into the kiln of outside cold air.

Perkins Vegetable Glue

PERKINS 183 was the FIRST VEGETABLE GLUE ever sold to high grade wood working concerns and PERKINS 183 is now the last word to be said of a HIGH GRADE, UNIFORM QUALITY, GLUE. Much money and effort have been spent on work covering a period of years; many changes were made in the formula until the present manufacturing process of 183 was reached and for fourteen years this glue has successfully filled the requirements of HIGH CLASS GLUE. Both our research and factory laboratories are constantly working to improve manufacturing methods and we shall never be satisfied to give the trade anything less than the best.

Numerous opportunities come our way to cheapen our product by making short cuts in our manufacturing process thus allowing us to sell at a lower price. We do not do this because the Trade would pay the bill first and later we would suffer in loss of trade.

Don't be Fooled about Fire Insurance

Fire insurance is one of the most important things you buy but that is no reason you should pay double price for it.

For the past twelve years we have written fire insurance on most of the large Canadian woodworking and lumber plants without an argument at the time of loss adjustment and we have saved these manufacturers thousands of dollars in their insurance costs.

We make our own rates, we are licensed in Canada and we give you a service that will hold your business as long as you have insurance to place.

We confine our business to lumber yards and woodworking plants, where the physical hazard and financial standing will meet with our rules of eligibility.

Perhaps we can only write a part of your insurance, depends upon the size of the plant, but it costs you nothing to take the matter up with us and it may be a big saving in insurance cost to you.

Address all communications to

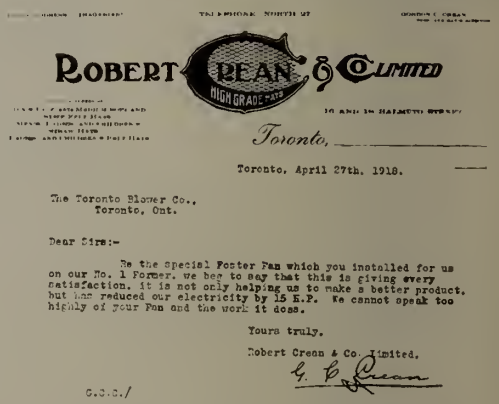
Here is the Proof →

This is conclusive proof of the efficiency of the FOSTER FAN under an unusually severe test.



ROBERT REAN & CO LIMITED
HIGH GRADE

Toronto, _____

Toronto, April 27th, 1918.

The Toronto Blower Co.,
Toronto, Ont.

Dear Sirs:-

Re the Special Foster Fan which you installed for us on our No. 1 Former, we beg to say that this is giving every satisfaction. It is not only helping us to make a better product, but has reduced our electricity by 15 H.P. We cannot speak too highly of your Fan and the work it does.

Yours truly,
Robert Crean & Co. Limited,
G. B. Crean

G.B.C./

We are Specialists

We design, install and guarantee our systems from the making of the fan right down to the finest detail of installation.

PATENTED

← THIS IS THE FAN THAT SAVED 15 H.P.

The "Foster Fan"—the heart of our blower systems—is of special design, being the only non-centre suction fan on the market.

It will handle any conceivable material continuously—without clogging, and is the only suction fan having a bearing on the inlet side, thereby eliminating the over-hung wheel. These fans are equipped with special ball bearings, and if desired are also equipped with special ball bearing loose pulley.

Let us demonstrate the most satisfactory exhaust system in Canada.

Toronto Blower Company
156 Duke Street TORONTO, Ont.

ESTABLISHED 1867 OTIS TRADE MARK INCORPORATED 1886

MAHOGANY
The King of Woods

The above photograph shows many thousands of feet of this regal lumber in our yards. Hewn from the jungles of the tropics, escorted along many miles of inland river to the sea, by chattering, singing black men, then shipped to our mills; this, in brief, is the story of the King of the woods. Mahogany.

WE ARE MANUFACTURERS AND IMPORTERS OF

Tabasco, Laguna, Honduras, and Mexican Mahogany

The Otis mills have a capacity of 12,000,000 feet per year. This assures our customers that we possess an adequate supply. Write for our quotations.

Are You Prepared For a Lumber Famine?

THE present situation among manufacturers, according to market reports, shows that Hardwood Stocks are far short of normal.

To those in close touch with the Lumber industry, there are positive signs pointing to a change in the lumber situation—values are bound to stiffen.

Prices are now at rock-bottom—this will not last. A sudden demand will shoot prices up again.

Just look over YOUR requirements for Birch, Basswood, Hard Maple, or Elm, now—and get quotations from us without delay.

We own our stumpage and operate our own band mill in Bude, Miss., manufacturing ten million feet annually, on which we specialize in Quartered White Oak, manufactured from genuine forked leaf White Oak and Yellow Poplar of fine soft texture grown in the hills of Southern Mississippi.

Our grades are dependable and the manufacture of our stock is unsurpassed. We respectfully solicit your enquiries, which will receive our prompt and courteous attention.

L. D. Murrelle Lumber Company

General Sales Office: 1524 Exchange Bldg., Memphis, Tennessee

OUR MOTTO

REASONABLE PRICES – that you can afford to pay.
EFFICIENT SERVICE — that you have a right to expect
FAIR TREATMENT — that you can depend on getting

We would appreciate an opportunity of furnishing a portion of your lumber requirements.

AMERICAN WALNUT

"The Cabinet-wood Superlative."

Walnut Memories

and

Looking Forward

What pleasant memories a superb modern Hall Clock of American Walnut, for example, will awaken in the minds of those whose earliest associations are centered about American Walnut furniture! And the cherished pieces of American Walnut which you place in your home today will awaken the same fond memories in the breasts of those of your family into whose proud possession they shall come in later years.

In all the better furniture stores are fine examples of American Walnut furniture, "The Cabinet Wood for the Ages," which you will enjoy buying. Will you make it a point to see them?

Write for the American Walnut Brochure—edition de luxe—which is filled with information about this historic wood.

AMERICAN WALNUT MANUFACTURERS' ASSOCIATION
Room 1019, 616 South Michigan Boulevard, Chicago

THE POWERFUL EFFECTS OF THE ADVERTISING

of AMERICAN WALNUT in the best publications in America are being felt increasingly by all branches of the furniture industry. (Do you wonder the public "sits up" and walks in, and says, "AMERICAN WALNUT, please.")

THE BEST FURNITURE HOUSES IN THE COUNTRY

are "checking in" with the demand our advertising is creating. It naturally follows that only those which are well stocked will be able to "cash in" fully on this AMERICAN WALNUT revival.

30 Million Feet Hardwoods Yearly

Manufactured by

Darnell-Love Lumber Co.

"What Others Say"

"Your letter of February 15th received and we want to say that this was a very nice lot of lumber. It was good widths and lengths and well manufactured, dry stock and the grading was very liberal. We are sorry we cannot use more of this lumber at the present time. *We received several cars from other manufacturers at a cheaper price but the lumber was not nearly as satisfactory.* When we are in need of more stock we will take the matter up with you."

(Note—The above was sent us February 24, 1921 unsolicited. Name given on application).

Who is blamable for the ignorance of the public generally in respect to manufacturers' prices of hardwood lumber?

Largely the newspapers, but essentially the manufacturers themselves.

Many newspapers are edited and conducted along the lines of least resistance. It is easier to write an editorial out of the abysmal fund of ignorance, with which unhappily too many editors seem generously supplied, than to write concerning facts which it may require some energy, industry and application to acquire.

These observations are suggested by an editorial a few days ago, in a paper of considerable standing and wide circulation, which commented upon the present "extortionate prices" of lumber being exacted from the public by the producers. It spoke of the effect of such prices in diminishing the building spirit, etc.

Such conduct of newspapers does more than can be imagined to produce the very effect they deplore,—and such papers do these things—let us assume in charity—through ignorance.

The editor of the paper referred to, did not know that hardwood manufacturers had been selling their lumber for months at less than cost.

Manufacturers, wholesalers, retailers,—everybody interested in lumber, should in their respective communities see to it that the truth is known—such false impressions hurt the industry in its every department.

Business is improving; with everyone taking action to make the truth known, it will improve more rapidly.

Is Greater Production the Solution?

The attention of the reader is directed to an interesting article elsewhere in this issue in which Wm. A. Babbitt, the general secretary of the National Association of Wood Turners, analyzes factory costs and points out the startling fact that a 30 per cent. increase in production results in reducing the selling price of an article to a greater extent than a reduction of 25 per cent. in the cost of both labor and raw material. The point is a vital one—one that is not fully realized—and should have the careful consideration of both employer and employed.

The attitude of certain woodworkers seems to be that, now that lumber and other raw materials have declined, all that is required to bring costs down to a normal basis is to make a cut in wages. When that has been done, manufacturing costs have been reduced to the lowest point possible under present conditions, or, in other words, all that is possible has been done to establish a new level of values. This attitude takes for granted that there is no room for improvement either in the organization and equipment of the plant or in the productiveness of the employees.

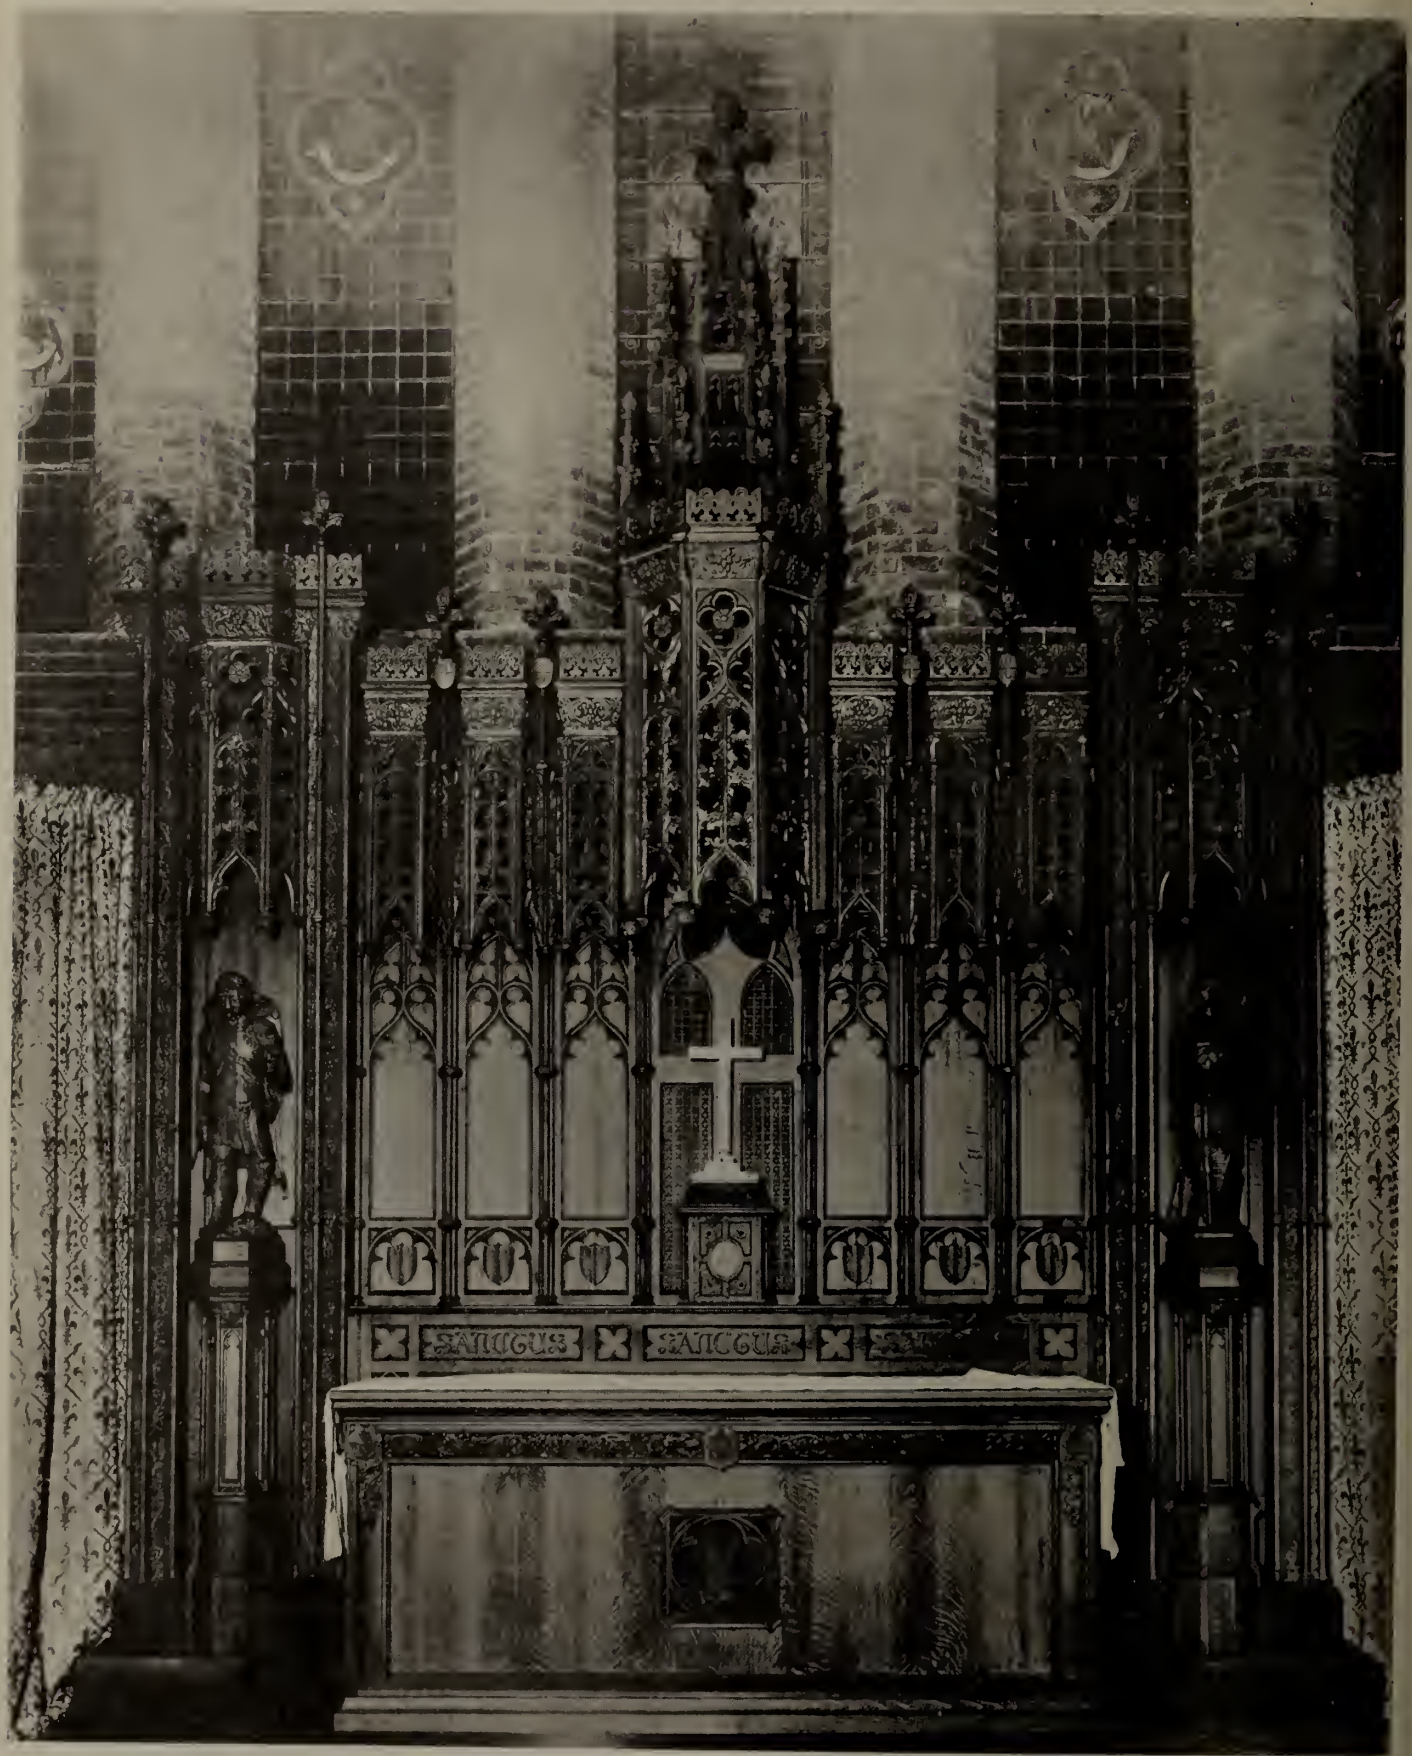
Efficiency, economy, productiveness and co-operation are words that have been worked overtime in recent years, yet the period upon which we are just entering is one in which these qualities or properties are required, in both the individual and the organization as a whole, as never before. This is true for a number of reasons, among which might be cited the fact that because of the smaller volume of business offering, there will be keener competition for all orders which may be available and to the fact that a low level of values must be established before the confidence of the public is restored and buying becomes general. It is, therefore, the duty, as well as a wise protective measure, of every manufacturer to give the closest possible attention to the manufacturing end of his business.

It may be suggested that an up-to-date, well-equipped, systematically organized plant is of little benefit unless the workmen put their shoulders to the wheel and do their best. There may be a lot of truth in this suggestion, but first give your employees the tools and organization and then go after them for results. Regardless of how practical and how skilled the workmen may be, they are handicapped both mentally and physically unless the environment in which they work is modern in all respects. It stands to reason that a mechanic will not have the same incentive to do his best or will not derive the same amount of pleasure from his work if he is forced to labor under antiquated methods and with out-of-date equipment, as if modern machines were provided and he is forced to extend himself to keep up with the development of the organization. Provision must be made to bring out the best that is in the man before the best should be expected.

After being satisfied that the plant and system is as it should be, the next step is to win the confidence and co-operation of the employees. There is no doubt that their efficiency has been impaired and that they do not look on their work as seriously as they were wont to do in former years. Explain the seriousness of the present situation to them. Show how vital it is, not only to the business but to their means of earning a living, that new low values be reached and trade stimulated. Outline by means of charts and figures, the far-reaching effect of overhead and production on manufacturing costs; show how an increase in productiveness is far better than a reduction in wages, even carrying it to the extent where if the output can be raised to a certain point an increase in wages is possible. Let this be the goal toward which they strive.

Probably one of the best means of securing the confidence of the men is the holding of regular, informal discussions between the management and the foremen and department heads. This idea is being gradually adopted by the woodworking fraternity in Canada. The manager of one large woodworking plant in describing some of the meetings he has held with his employees, stated that it was a surprise to him how readily those present grasped the essentials of the situation and the wealth and practicability of the suggestions made and the spirit shown when once their co-operation was secured.

The goal — increased production — is clearly defined. Let both employer and employee strive with this single purpose in view and both will profit in proportion to the progress made toward this objective.



Carved oak reredos and altar for the Church of St. John The Evangelist, Hamilton, Ont., made and installed by the Valley City Seating Co., Limited, Dundas, Ont.

Canadian Craftmanship Ranks High

Altar and Reredos in Hamilton Church Work of Art—Detail of Carvings Exceptionally Fine—Reflects Credit on Manufacturer and Artisans

A very noteworthy example of the wood carver's art in the form of an altar and reredos, has recently been installed in the Church of St. John the Evangelist, Hamilton, Ontario, in memory of the two sons of the Reverend Canon Daw, the late rector of the parish, and of their cousin, A. G. Fraser, who made the supreme sacrifice while serving the Empire in the Great War.

Centre Panel of Altar.

The altar is chaste and simple in design, the wide expanse of the front being relieved only by an exquisitely carved panel in the centre and the natural beauty of the oak grain. This treament emphasizes the richness of the reredos with its wealth of decorative detail. The cornice is enriched by running foliage with the inscription "To the Glory of God" interwoven. At each corner and in the centre of the cornice is a shield with the crests of the 21st, the 58th and the Worcestershire Regiments carved in relief, representing the units in which those whose memory is being perpetuated saw service.

The detail of the ornament of the central panel is particularly fine. An elegantly carved shield with the I.H.S. emblem cut in relief is enclosed in a quarterfoil which in turn is contained in a circle within a square. Within the quarterfoil and surrounding the shield are carved the Rose, Thistle, Shamrock and Maple Leak in natural foliage. In the end panel of the altar is engraved the names of the fallen heroes, cut deeply in the solid oak. The altar is 9 ft. in length, 2 ft. 6 in. in depth and 3 ft. 3 in. high. It stands clear of the reredos, a space of two feet being allowed for passage between. The design of the reredos in general follows the fifteenth century perpendicular Gothic, the principal feature being a central canopy with spire, the finial of which rises 20 feet from the floor of the Sanctuary, and two well-proportioned side towers which form niches for figures of the militant saints, St. George and St. Michael.

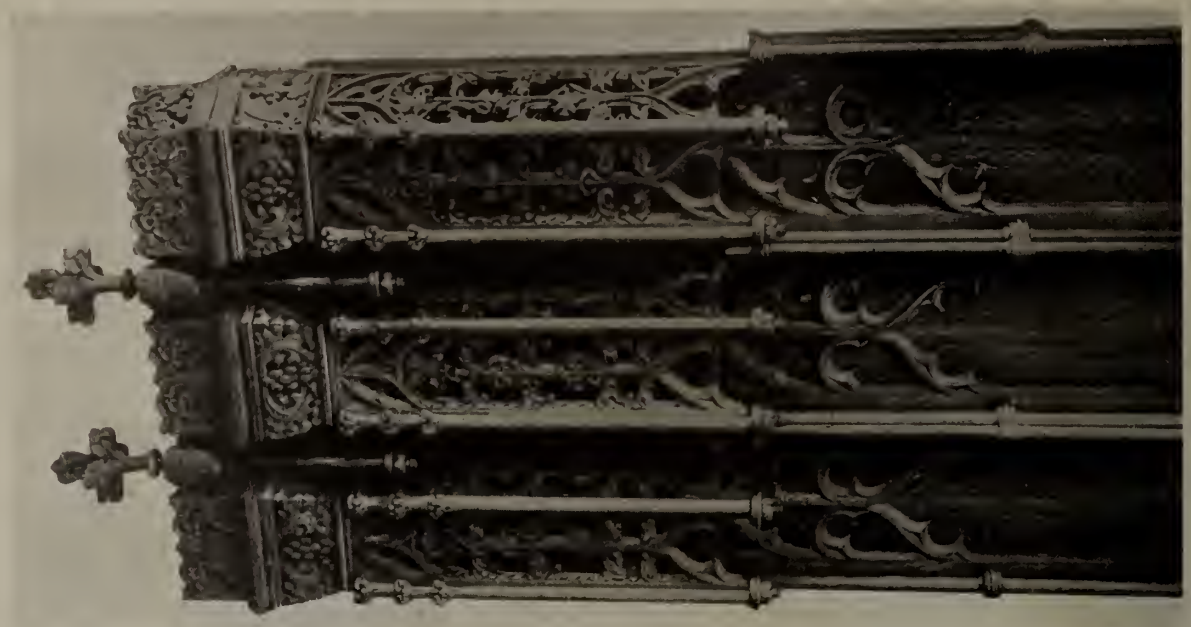
These towers are connected to the central canopy by a series of smaller canopies, three at each side. An enriched cornice and carved and perforated cresting surmounts all the towers and canopies with small carved finials placed at intervals. The background is enriched by tracery panels, the lower portion of which forms a series of arches each enclosing a shield. Upon the gradine or retable are the words "Sanctus, Sanctus, Sanctus," each letter of which is finely modelled and carved in relief. A small but exquisite tabernacle has been introduced in front of the centre panel, which supports a cross. The Tabernacle was removed from the old altar and incorporated some time ago.

The centre canopy is 10 ft. 6 in. high, and is octagon in plan. The lower portion is composed of open work tracery panels with free natural ornament interwoven. No two of these panels are alike, yet each is in harmony with the rest. The posts are terminated with winged cherub heads. The cornice is enriched by free ornament of conventional design and further embellished by a carved and perforated cresting; a slender crocketed pinnacle rises from each post. Above the cornice is a tier of open tracery panels of strictly conventional character with a second series of crocketed pinnacles at each angle, and these in turn surmounted by a tapered tracery spire terminated with a large carved finial.

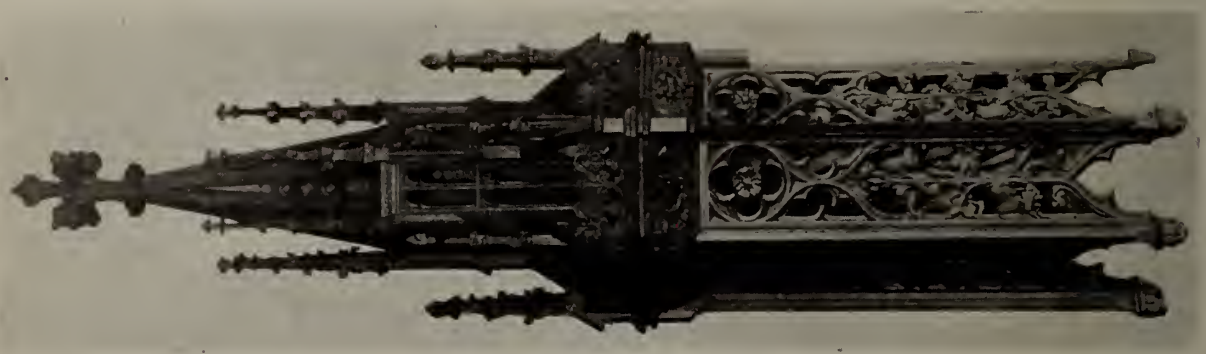
The side towers, 13 ft. 6 in. in height, are a particularly pleasing feature of the design. They form each a niche for the figures which stand on pedestals. The posts of these towers are triangular in plan, the apex being to the front, and the angles covered by a slender turned post. The foremost one proceeds in front of the cornice, and terminates in a carved pinnacle, producing an unusual and pleasing effect. The sides of the triangular posts are decorated by a perforated grape vine ornament, freely carved in natural foliage. The illustration of the upper canopy of these towers show the detail of this ornamentation very clearly, the deep shadows of the recess throwing the lines of the carved tracery of the panels into prominence and producing a light and lace-like effect. The illustration also shows the rich model-

Attractive in its simplicity—The altar.

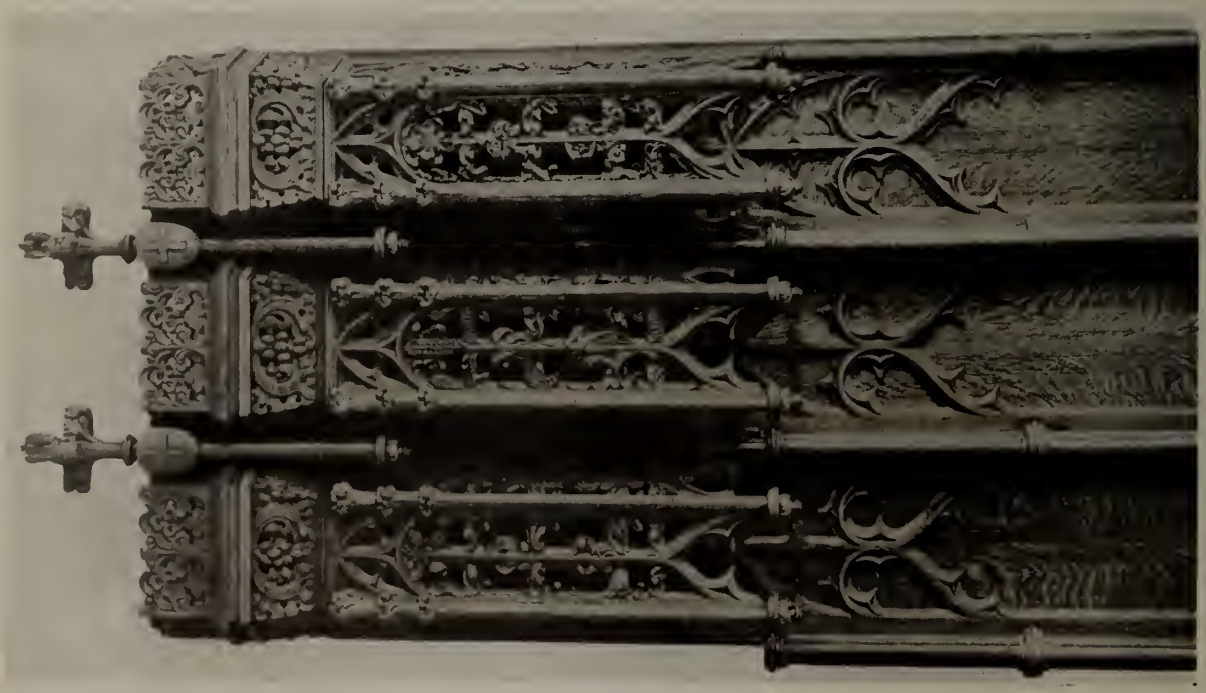
Views Showing Details of Canopy



Intermediate canopy (right).



Centre canopy.



Intermediate canopy (left).

Figure of St. Michael.

Upper canopy of side towers showing fineness of detail.

Figure of St. George.

ling of the carved cornice and cresting very distinctly.

The intermediate canopies have a special feature in their open work carved panels, eighteen in number, which are all cut to a different motif, the Rose, Thistle, Shamrock, Maple Leaf, Wheat, Vine and Pomegranate being exemplified among others. The skill and individuality of the craftsman are especially noticeable in these panels, making them a dominant feature of the whole work.

The figures stand 36 inches high and are carved of solid oak. The figure of St. George closely follows the "Donatilli" St. George. The figure of St. Michael was still in the hands of the carver when the photo was taken.

The whole is generally conceded to be an exceptionally fine piece of wood craftsmanship, as well as an excellent example of "Made in Canada" art. The work in its entirety was produced in the workshops of the Valley City Seating Company, Dundas, Ontario, and was executed by their regular staff of designers and craftesmen under the supervision of Mr. W. P. Witton of the firm of Witton & Walsh, architects, Hamilton.

It is, to say the least, a superb and inspiring memorial one which is admirably executed, and a lasting credit to those who conceived and executed the design.

The optimist is the man who sees in every obstacle an opportunity; the pessimist is the man who sees in opportunity an obstacle.

Turning Curtain Rings

Curtain rings are turned up on a single-head lathe of short bed length, a friction clutch being situated on the head stock spindle and operated by means of a foot-lever or treadle. In conjunction therewith is also a brake, which also is applied through a foot-lever, its purpose being to stop the lathe spindle smartly, and to avoid loss of time in putting in and taking out the work.

The wood for the rings is sawn into squares a little larger and thicker than the finished article, and is held by a special screwed driving centre, the spindle being stopped by the treadle and brake. As soon as the wood is gripped, the treadle is released, and the spindle and wood instantly revolve, the time taken to stop the spindle being 1½ seconds, while from standing to full speed of the lathe occupies only about 4 seconds.

The front tool for forming, as also the cutting-out tool, is arranged on a specially-designed slide rest attachment, which is adjustable on the bed of the lathe. The operation consists in swinging round the front tool on its axis, which movement forms the outside of the ring; this tool is then swung clear of the work and the back tool brought into play, which action cuts out the inside, and the ring is complete.

The lathe is run at from three to four thousand revolutions per minute, and when once it is set up, and the tools arranged to deal with the size of ring required, skilled labor is no longer needed.

Furniture Men to Rectify Tactical Error

Enthusiasm for Publicity Campaign Should Have Been Maintained—Would Have Stimulated Demand During Last Few Months When Business Was Needed—Likely to be Revived at Early Date

By THE EDITOR

The furniture industry is coming to the fore again. A provincial charter was recently granted the Home Furnishings Bureau to carry on as a non-profit-making association. This marks the first step in the rejuvenation of the Better Furnished Homes Campaign which flourished for a short while last fall.

In deciding to go ahead with this general publicity work, the furniture men are well advised. The small amount of advertising done last autumn seemed to fill an undoubted need. It, certainly, caught the fancy of the retail dealer and created a feeling of co-operation and goodwill that augured well for the future of the furniture industry and for the relationship which exists between dealer and manufacturer. In addition, it succeeded in creating a demand for furniture.

Showed Gratifying Results

Exception may be taken to this last assertion, but it is none the less true and is borne out by letters from retailers which are on file at the office of the Bureau. The extent or strength of the demand thus created is open to question. In the opinion of the writer it was such that the stocks in the hands of the retailers to-day are at a very low ebb, and if the campaign had not been allowed to lapse, the furniture buyers would have found it necessary to enter the market before this and the furniture industry would not have experienced such a slump as that from which it is just recovering.

To have enabled the furniture dealer to dispose of his surplus and reduce his stock, without accepting a heavy loss at a time when other merchants were sacrificing profits and goods in a vain endeavor to keep things moving, is to have accomplished something worth while. That the furniture retailer did not immediately enter the market and replenish his stock was due in part to two factors. One was the general air of uncertainty which pervaded the whole industrial life of Canada because of the fact that new low price levels were anticipated, and the other was that the Publicity Campaign inaugurated by the furniture manufacturers, had been allowed to lapse. This latter fact naturally made the dealer wonder if the demand for furniture would fall as flat as it had for other lines.

Invest in Publicity

Another disturbing feature was the price reductions made by the manufacturers. The first cut in furniture prices was warranted by a corresponding decrease in manufacturing costs. This tended to have a steadying effect on the whole industry and to stimulate business. When the retailers had made up their minds to buy and were about to enter the market, prices took a further drop. The result was to create another wave of uncertainty which is only just passing away.

If instead of slashing prices and putting into effect reductions ranging from 10 to 30 per cent., the manufacturers had seen fit to reduce prices, say, from 5 to 20 per cent., and had turned the other 5 per cent. thus saved over to the Home Furnishings Bureau for a sales compelling publicity campaign, the results would likely have surprised the most sanguine and would have worked out to the benefit of both the manufacturing and retailing branches of the industry. If a manufacturer is willing to contribute from 10 to 30 per cent. of his gross sales, for that is what a reduction in price amounts to, in an effort to stimulate a demand, why should he hesitate about donating from 2 to 5 per cent. of gross sales toward a campaign which cannot help but result in increased business? It is a question if the money invested in price reductions has been spent to the best advantage.

Should Make Furniture Popular

However, there is not much to be gained by harping on what has taken place. The campaign is being revived at a period when it will do untold good. Increasing the demand at a time when the stocks in the hands of the retailers are greatly reduced, simply forces the dealer's hands, compelling him to enter the market and replenish his floors. Another fortunate feature is that a similar campaign is about to be put over by the American furniture industry on a proportionately larger scale. With these two campaigns in full swing and everybody talking and thinking furniture and better furnished homes, 1921 and succeeding years should be furniture years.

Film Manufacture of Hardwoods

To impress the users of labor and to acquaint the public generally, with the extreme difficulty, expense and even hazard in manufacturing their product, the American Hardwood Manufacturers Association, of Memphis, Tenn., has offered for showing to conventions, colleges, schools, and other educational centers a two reel moving picture.

This picture, produced by the Atlas Educational Film Company, Chicago, embraces scenes in the swampy lowlands of the south and the Appalachian mountains. The entire journey of a log, from the moment the tree is cut down in the forest to the time it is turned out in finished board, is interestingly shown. The primeval wildness of the mountains lends a striking light on many scenes which are splendidly photographed and done in a soft sepia.

The felling of the big trees, how they are towed out of the almost impenetrable swamps, or brought down the steep sides of mountains across streams and over all sorts of natural difficulties are depicted in a way that surprise the layman spectator who probably never dreamed of the great trouble involved and expense incurred in producing the wood for his sideboard or his dining room table. The association has had many requests for showings.

A third reel made for showings to manufacturers, especially, has for its purpose the conservation of lumber. It particularly shows the great variety of table tops and small type furniture that can be made from "dimension" stock of former wastage. This picture, too, has met with cordial comment wherever it has been shown.

Engineering in Furniture Factories

Are Managers of Furniture Factories More Interested in Selling Than Producing? Principles Involved in Planning and Reorganizing Furniture Manufacturing Plant—How Efficient Layout is Determined

By B. H. Parks*

The woodworking industry, including the manufacture of wooden furniture, is one of the oldest industries extant and yet it has shown the least development and has been the slowest to adopt modern principles of manufacturing of any industry of which the writer has knowledge. There are several causes for this condition, the most important of which are the general lack of accurate cost data in all but a very few plants and the absence of technically trained men in the executive positions.

The lack of accurate cost data is naturally reflected in the margin of profit, which in the majority of cases has been so small that no surplus has been available for plant improvements and very little for even proper maintenance. In several plants which have come under the writer's notice, only such repairs have been made as were necessary to avoid actual breakdowns, and machinery, power plant equipment, lighting, heating, drying, sanitary facilities, etc., have been entirely inadequate and inefficient and would not be tolerated in even the average modern plant of most other industries.

In the several woodworking and furniture-manufacturing plant organizations that have come under the writer's observation, he does not recall a single man with a technical education or training. The development of practically all modern industries to their present high state of manufacturing efficiency has been accomplished by engineers, as witness the metal-working industry, and who would dare say that the metal-working industry would never have reached its present state of development without the guiding hand of the technically trained engineer?

This lack of engineering ability in the furniture-manufacturing organization shows its effect throughout the entire plant; in fact, the writer is convinced that the average manager of a furniture plant is more interested in marketing his product than in manufacturing it. Furniture is constantly changing in style, also most plants manufacture quite an extended line, and consequently a large variety of product must be handled in any given plant. A point which most managers overlook is the possibility of reducing the variety of parts to be manufactured through standardization of design, interchangeability of parts, and greater limitation of line. This reduction of variety of parts would not only directly reduce manufacturing costs but would also tend toward the development of automatic machinery, better utilization of raw product, economies in handling parts in process of manufacture, etc.

Influences Against Rapid Development.

It is not the writer's purpose to discuss the manufacture of furniture, however, but only to point out some of the influences which have militated against the more rapid development of the industry in the past, and then proceed to a discussion of some of the principles involved in the design of a new furniture-manufacturing plant and the improvement of existing plants. A furniture-manufacturing plant, as in fact any industrial plant, is in the final analysis simply a workshop for turning out a certain product of a specified quantity and standard of quality in a given time at a minimum of cost. While the problem is easy to state, the solution is very complex, and there are so many factors to be considered that the final solution must of necessity be more or less of a compromise.

The efficiency of any general plan for a furniture-manufacturing plant, or in fact any industrial plant, may be measured by the degree in which the following requirements are fulfilled:—

(a) Provision for proper arrangement of the necessary machinery.

(b) Provision for receiving, handling, storing, and transporting material.

(c) Provision for extending the plant and increasing manufacturing facilities without serious disturbance to the original plant or manufacturing routes.

(d) Provision for generation and transmission of power, light and heat.

(e) Provision for fire protection.

(f) Provision for comfort and accommodation of employees.

Before proceeding to a discussion of the above, let it be known that the writer does not lay claim to the discovery of any new engineering principles applying to the problem. The attempt is simply made to point out some of the important questions to be considered in the design of a furniture factory with suggestions for their solution. Neither is it intended that any one should attempt to design a furniture factory merely with the aid of the data and suggestions given herewith. Each plant is a problem in itself with certain factors unlike any other plant. Consequently the services of a thoroughly competent engineer to work out the general plan and multitude of detail involved will be found to be of the utmost importance to those about to engage in a new manufacturing venture.

Suitable Location for Plant.

The importance of the location and arrangement of a furniture factory has not generally received the attention their economic value should dictate. In small plants supplying largely a local market, equipment and arrangement are the prime considerations, but for large plants supplying a widespread market, questions of adequate transportation for both raw materials and finished product, labor supply, taxes, etc., assume great importance.

The furniture industry, the same as other industries, has tended to concentrate in given localities, as, for example, Grand Rapids, Mich. This concentration was originally due to nearness to the raw material supply. As the number of plants multiplied a good supply of skilled labor has accumulated, so that now, even when Grand Rapids is not so well situated as other centres as regards nearness to raw material supply, the labor market as well as a certain reputation attaching to Grand Rapids product has tended to increase the number of furniture-manufacturing plants in spite of the

*Address, Annual Meeting American Society of Mechanical Engineers, December, 1920.

fact that, theoretically at least, other centres would be more desirable from most standpoints. In general, however, the location of a furniture plant, as for most other types of manufacturing, will be dependent on the following considerations:—

(a) Transportation facilities for both raw material and finished product.

(b) Availability of raw materials and manufactured parts obtained from other industries.

(c) Labor supply.

(d) Financial considerations.

(e) Civic or municipal aids or restrictions to manufacturing.

The actual site will also be selected having the following considerations in mind:—

(a) Shipping facilities.

(b) Adequacy of area.

(c) Levelness of site.

(d) Availability of water supply and sewage disposal.

(e) Nearness of adequate housing or possibility of providing adequate housing for labor.

Having chosen the site the problem then devolves into one of designing the most efficient plant which the site chosen will permit. For many years it was the custom, and still is to a great extent, to allow the plant superintendent to design an entire new plant. While the superintendent may be an expert in manufacturing furniture and entirely competent to select the necessary tools and machinery, yet in most instances he is poorly informed regarding the most economical practice in power-plant construction, heating, lighting, construction of buildings, and the many other important questions entering into the design and construction of the entire plant. While the superintendent will be of great assistance in the work, yet in this day of specialization the design and layout of the plant should be intrusted only to engineers recognized as experts in this particular line of endeavor.

Proper Arrangement of Machinery.

Making provision for the proper installation and arrangement of the necessary tools and machinery presupposes that the kind, quantity, and quality of the produce have been decided upon and that due and proper care has been given to the selection of the machinery required in the manufacture of this product. Naturally the first consideration is the location of the lumber yard and dry kilns in relation to the incoming lumber to the factory. The location of the lumber yard will of course depend on the arrangement of railroad sidings. Several different plans for location of sidings may be possible for any given site and the most efficient layout can be determined only by close study of the factors entering into any given situation.

After deciding, at least tentatively, on the location of lumber yard and kilns this will ordinarily determine the point of entrance for the raw lumber into the proposed plant, and the next procedure will be to make a routing chart and thus establish the amount of floor space required for manufacturing purposes. Having determined the entry point for the raw material consideration should be given to each factory operation with the sequence required for manufacturing the product. The routing chart should list each separate part entering into the finished product, with the proposed volume of manufacture per unit of time, say, one year, and the sequence of operations required. Such a routing chart giving the sequence of operations will establish in a general way the sequence of arrangement of the various tools and machines throughout the plant.

As stated above, it has been assumed that all machinery has been selected and the next procedure would be to make a templet to scale of each article of equipment, such as all machines, tools, benches, racks, etc. Each templet of a machine should indicate the path of the product through the machine, the point of application of power, the position of the operator, and position of helper, if any. It will be assumed that the proposed main manufacturing building will be of the multi-storied type, for reasons which will be mentioned hereinafter, and consequently the width should not exceed 50 to 60 ft. to obtain proper daylighting. In laying out the templets of the machines, however, it may be assumed temporarily that the building will be but one storey high and the machinery arranged as though in a long building with everything on one floor. By using templets of the various parts of the equipment to determine the arrangement it allows the units to be moved about until a satisfactory arrangement is found, the marks on the templets allowing the machines to be set in proper relation to flow of product, power supply, lighting, etc.

Studying Layout of Equipment

After a tentative arrangement of the equipment has been completed a careful study should be made of how the product is to be transported from machine to machine, making proper provision for aisleways and location of trucks at machines to allow of efficient handling of material in and out of machines. Consideration should also be given to the necessity of providing spaces for accumulation of material between machines where the speed of handling varies.

The final arrangement of the templets will determine the amount of floor space required for machine rooms, and careful consideration should then be given to the location and size of store rooms, assembling, finishing, upholstering, crating, and shipping departments, factory offices, toilets, locker rooms, etc. With the approximate total amount of floor space decided upon, a tentative layout of the building may be made. The product of a furniture factory being comparatively light in weight, and consequently easily transported, a multi-storied building will in most cases be found the most economical from all standpoints, although 4 or 5 stories in height should probably be the limit. The various departments may then be arranged with machine room and shipping department on the first floor, additional machine room if required on the second floor, and assembling, finishing and upholstering departments on the upper floors, care being exercised to so arrange the various departments that the flow of product may be as direct and uninterrupted as possible through each department and then on to the next.

Factory Transportation System.

Upon completing the arrangement of the various departments the next problem will be one of transportation between the several departments on the different floors, which is accomplished ordinarily by means of elevators. In connection with the transportation problem, thought should be given to the possibility of using chutes, conveyors or small elevators from one department to another, thus establishing more direct paths of flow than could be obtained by using the main elevators and also reducing considerably the amount of handling required. In general, one elevator at each end of the building will be sufficient if the building does not exceed about 300 ft. in

length, particularly if the elevator equipment is augmented by means of conveyors or small auxiliary elevators as mentioned above.

The floor space and general arrangement of the main manufacturing building having been determined, the next decision to be made is the type of construction to use. This is somewhat limited to materials available, although in most centres where a furniture factory is likely to be built the ordinary forms of construction such as reinforced concrete, slow-burning mill, or steel frame, will be found applicable. Reinforced concrete is rapidly coming into use as one of the most economical types of construction, when all factors are considered, and yet the writer regards the slow-burning, heavy-mill type of construction as particularly adaptable to a furniture factory and for the reason that in addition to its slight advantage in first cost it has the decided advantage of allowing the installation of machinery, limeshafting, lighting, heating and plumbing equipment with a minimum of labor and expense and also allows alterations to be made much more readily than where reinforced concrete construction is used.

Mill construction is oftentimes confused with the light and cheap frame structures frequently erected for factory purposes and consisting of light brick walls, small wood posts and beams and light joists placed on close centres. Good slow-burning mill construction should not be maligned by using the name in connection with such construction as mentioned above. True slow-burning mill construction consists of good substantial brick walls and pilasters, wood columns or posts not less than 10 in. on a side, heavy wood beams or girders, floor and roof joists at least 8 in. in smallest dimension, and heavy plank floors and roof at least 3 in. thick. Such construction properly designed and erected has, in the writer's opinion, many of the advantages for factory purposes of reinforced concrete and even some advantages which reinforced concrete does not possess.

It seems unnecessary to more than mention the advisability of so designing a building as to obtain a maximum of daylight and ventilation through the use of large windows; to enclose elevators and stair wells in fireproof towers, with all openings thereto fitted with fire doors; to provide exterior doors to stairs to use in case of fire; and to work out all details of design and construction from the standpoint of overall economy and efficiency instead of cheapness.

Train Foremen to be Better Managers

Foreman Holds Key Position to Production—Should be Trained to Interpret the Management—Assist in Securing All Season Efficiency

By P. L. Burkhard*

The future of our industries, whether they be machine shops, foundries, rolling mills, ship-yards or woodworking plants, rests in the hands of the management. One of the important and too frequently overlooked branches of management is that of foremanship. The foreman in the yard or in the plant holds the key position to efficient production. He is the point of contact between the man at the top and the men who do the work. The very position he occupies gives him power far greater than is usually recognized. He can through his own abilities and effort, or lack of ability and effort, cause a business to either loose money or make money. There is today a tremendous opportunity open to progressive manufacturers to train their shop executive force to be better managers.

The foreman should think and act just as the general manager would think and act, if he were on the job, as daily problems arise. It is high time, therefore,that buisenss men grasp the open opportunity to make their foremen better managers, or, as I like to express it, make them industrial engineers upon their own jobs. Train them to see the possibilities for improvement that stare them in the face, and train them to make these improvements themselves.

The Logical Efficiency Man

Foremen are as a rule selected for their jobs because they have been with the concern a long time, or are good workers, or for any or more of thousands of illogical reasons. Few men have been chosen for the foreman's job because they are good managers or because they can see and act as managers themselves do. They have served no apprenticeship for the important job of foreman. They lack training. Why not make it possible for them to become acquainted with the principles and practices which make for efficiency in the shops? Although very few foremen recognize the fact, the efficiency men of any industry are the department heads, the true key men of the industry. The only reason I can see why many foremen do no function as such is because they do not accept the facts.

Now this does not mean that foremen should undertake the duties of the production manager or the planning department, or even that experts should not be retained for factory reorganization. But it does mean that foremen should function more closely in relation to the particular work of whatever efficiency department may be operating. Many foremen fail to accept the responsibilities, and many managers neglect showing these responsibilities to the foremen, of maintaining the highest batting averages which a plant is capable of hitting.

An Aid in Present Situation

The world is confronting a new situation today, and very few of us know what is going to happen next. In many plants production has been cut and the trend is still downward. This means something to everyone of us. It is going to take a lot of common sense to pull us through this period of industrial readjustment. Since the problem is an industrial one there is no reason why foremen should not be expected to contribute their share in pulling us through.

This brings us to the question as to why the foreman is the logical efficiency man. All engineering has to do with two major processes, utilization and elimination. When you translate these terms into production it means simply that the greatest possible use must be obtained from every element which goes into production, and that every waste which may be

*Burkhard Griswold Co., Cleveland, Ohio, Industrial Training Consultants.

common to any one of the same elements should be minimized, or eliminated if possible. As efficiency engineers or production men, the foreman should accept the responsibility of getting the maximum result. This is the first step, utilization. And as he succeeds in getting the maximum result, he consciously or unconsciously takes the second step, elimination. It does not require much knowledge of mathematics to figure out that if a foreman makes a study of the existing wastes, and cuts them out, the maximum return will be greater.

All Season Efficiency

This maximum return or result is just as essential at one time as at another. Unless the factory is getting the maximum return at every season of the year, consistent with conditions of the season, good dollars and cents go down into the bottomless pit never to be coaxed back. Where wastes exist the maximum return is not being secured. No matter whether we are in a period of increasing, decreasing or constant demand for our product, it is essential that the lowest unit production cost be obtained. This is just another way of saying the same thing, but I want to hit it from every possible angle because the other day a foreman told me that his firm "didn't need any more efficiency because production had been cut 50 per cent and a lot of men had been laid off."

If he had tried to prove his argument he would have had to take the stand that 'because business isn't as good as it was we don't care what the costs are, let 'em go up." Now do not misunderstand me, he didn't say that the firm did not care what the costs were, but in effect that is what his argument amounted to. To carry the same theory further he would have had to have said that if the unit cost of a product was $1.00 when business was good, everybody could let up when business fell off and the unit cost could go up to $1.10 or $1.20.

Time for More Efficient Production

This foreman with whom I was talking was sure that his firm did not need any efficiency. Of course, he was wrong. Yet maybe the blame was not all his. Surely no one had explained to him the truth of the situation. He was speaking for his management. He was interpreting the management, yet he had a wrong conception of that for which the management stood. This man surely was not the efficiency man on his job. He had a wrong slant on production. If he talks that way to his men the firm certainly would be better off if he was employed by a competitor. At this very time, while he was expressing his opinion to the effect that efficiency was no longer needed because business was dull, the management was trying to figure out how the unit cost of their product could be reduced from $1.00 to $0.90 or even $0.80. The management recognized that now was the time for more effective productivity, greater efficiency.

Foremen who are the efficiency engineers in their own departments know something of the economic laws which underlie industrial activity and readily see that if a concern or even a department is to be operated as a paying proposition there must be serious thought for efficiency. They know that in the dull season it is more necessary than ever that the pennies be looked after. If there is any time when leaks and losses may be overloked it is when orders are so plentiful that the company can throw $1000 away without mising it. I do not mean by this that it is ever justified. There can be no justification for permitting waste, leaks and losses to occur within the factory walls. A dollar wasted is a dollar lost, and today waste is nothing short of criminal.

Identification of Different Oaks

Over fifty species of native oaks assume the proportions of trees, and about twenty-five are used for lumber. After the oaks are cut into lumber, there is no means known to the U. S. Forest Products Laboratory by which they can be identified as to exact species. By examination of the wood alone, however, it is easy to separate the oaks into two groups—the white oaks and the red oaks; and for most purposes, fortunately, it is not necessary to classify them any further. The oaks all average about the same in strength, but those in the white oak group are much more durable under conditions favorable to decay than those in the red oak group.

The white oak group includes true white oak, bur oak, cow oak, post oak, overcup oak, and chestnut oak. The red oak group includes true red oak, yellow or black oak, scarlet oak, Spanish oak, Texan oak, black jack, water oak, willow oak, and laurel oak.

The color of the wood is a ready but not absolutely reliable means of distinguishing the white oaks from the red oaks. Red oaks usually have a distinctly reddish tinge, especially near the knots. The wood of the white oaks is generally a grayish brown; but occasionally a reddish tinge is found in white oak.

For more accurate identification it is necessary to examine the pores of the wood. These will be found as tiny holes on a smoothly-cut end surface, the largest being visible to the unaided eye. They are not of uniform size throughout each growth ring, but are considerably larger in the wood formed in the spring, decreasing in size rather abruptly towards the summerwood. The large pores in the springwood of the heartwood and inner sapwood of the white oaks are usually plugged up with a froth-like growth called tyloses, and those of the red oaks are open.

To tell for a certainty whether a piece of oak belongs to the white or red oak group, cut the end grain smoothly with a sharp knife across several growth rings of average width. With the aid of a hand lens examine the small pores in the dense summerwood. If the pores in this part of the growth ring are plainly visible as minute rounded openings, and are not so crowded but that they can readily be counted, the wood belongs to the red oak group. If the pores in the summerwood are very small, somewhat angular, and so numerous that it would be exceedingly difficult to count them, the wood belongs to the white oak group.

Don't Stop

When someone stops advertising,
Someone stops buying.
When someone stops buying,
Someone stops selling.
When someone stops selling,
Someone stops making.
When someone stops making,
Someone stops earning.
When someone stops earning,
Everybody stops buying.
Keep going.—Printer's Ink.

How to Bring Down Factory Costs

Effect of Reduction in Certain Items on Final Factory Costs—Slight Cut in Wages May Have Startling Result—Suggestions Worth Pondering

By WM. A. BABBITT
General Secretary, National Association of Wood Turners, Inc.

The problems presented in adopting new price levels is not at all as simple as some loud shouting buying interests would have us, who have to stand the gaff, believe. The assumption is that if materials fall say 25%, and if wages contract a similar per cent, the factory cost falls 25%. We may say, in passing, that the manufacturer who lets the buyer do his cost figuring certainly has no right to complain at the result the buyer shows by his figures. But we maintain that this procedure puts too great a strain on the morals, to say nothing of the intelligence, of Mr. Buyer, to recommend it for general practise.

Let us look again at a general example made up on the standard cost formula:

Overhead 200% on direct labor	20.00
Direct Labor for the Job	10.00
Raw Materials Cost	$10.00
Total	$40.00

In this formula, it must be remembered that all figures are assumed and that the overhead per cent is taken arbitrarily at 200, and that actually this figure will vary with the individual plants, probably within the limits of 180-275. Overhead per cent is ratio of all expenses of doing business other than direct labor, to the direct labor. If the cost of raw materials drops 25% and other costs remain the same, then obviously the cost drops to $37.50, or sustains a drop of 6¼%.

Effect of Drop in Labor

Suppose the cost of labor drops 25%, what happens then? A lot of things that no one ever thought of until recently. It looks on the face of it, that this cut in wages might nip off another $2.50 from the cost. But the fact is that it is quite as likely to add to the cost.

You have to consider two outstanding variables or hazards of the manufacturing process. In the first place, there is the cost hazard of speeds. A cut in wages always has a tendency to slow down the production speeds of the plant:. It discourages some workers and makes others surly. So every manufacturer must study the result, rather than the face figure of every cut in wages. In the second place, you must consider the matter of "overhead." It is hard to see how anyone who fails to pivot all his expenses on his direct labor is going to answer this question, viz., of the effect of a wage reduction on his overhead.

If it were possible for you to go right down the entire list of items in your expense account, and slash the whole list for a 25% reduction, all would be well. Your 200% overhead would fall to 150%, and your factory cost would fall the 25% which the buyer demands. But it is more likely that your overhead per cent will not go down. It will almost certainly go up, or at best remain constant.

Many Items not Coming Down

Look at the items in your list. Fully half of them are accounts that cannot be cut, but are bound to be higher, such as taxes, insurance, depreciation, sales expenses, many kinds of supplies and the like. Then there is the matter of salaries. Are you cutting your own salary 25%, and your bookkeeper and your factory manager, and so on down the line? There does not seem to be much in the overhead to cut except the wages of unskilled labor, which procedure appeals much more keenly to your customer than it does to you.

If you leave your overhead substantially intact, then your overhead ratio is going to climb nearly enough to wipe out your wage cut. Your overhead ratio expresses the relation between the amount you pay the men, who conduct the actual manufacturing operations in your plant, and the amount required to give the supporting service which makes these manufacturing operations possible. You will at once see that unless your overhead is reduced to match the other reductions of wages and materials, you will be a long way from securing the desired reduction in cost. Assuming that your overhead remains intact, and your overhead is 200%. As this is the ratio of expense against ten dollar labor, you perceive that against seven fifty labor, the per cent. immediately leaps to 267%.

Furthermore, when we come to study the lumber, we find that our raw material prices cannot be reduced. It is true that there are bargains just now for buyers who dare to buy. But as soon as buying starts, lumber will immediately resume the price level which its scarcity and cost of production will inevitably command. In most cases the increased cost of freight fully offsets the decreased cost of lumber.

What a Second Glance Shows

Let us set up the cost formula again. To be very conservative, we will grant that labor can be counted on for the coming year at 25% lower wages. Let us assume that sufficient reductions in the wages of supporting labor can be made to effect a net drop of 15% in overhead. We cannot concede that lumber can be figured at lower costs. The formula will now read:

	Now	Before
Raw Materials	$10.00	$10.00
Off 25% Labor	7.50	10.00
Off 15 pts. Overhead (252%)	18.90	20.00
Total Cost	36.40	40.00

This study is given to enforce the lesson that the man who dares to make a price reduction of 25% until he has proven that he can effect the necessary reductions in every item of cost in his overhead as well as in his labor and materials is taking the kind of hazard from which the Good Lord is said to protect only children and fools.

Getting at Root of Problem

On the other hand, just see what happens, when, instead of cutting wages and the standard of living of your employees, you go after them and get an average 30% more production per man on the same outlay of overhead. Let us assume that the cost of $40.00

represents the total expense involved on a day's run of ten hours. If your operator is able to complete this ten-hour job in seven hours, you have gained three hours of direct labor, or $3.00. You have further gained the overhead on this labor, or $3.00. You have further gained the overhead on this labor, or $3.00. Your cost formula will show as follows:

Raw Materials	$10.00		
Direct Labor	10.00	less	$3.00
Overhead	20.00	less	6.00
Totals	40.00		9.00 gain
Net Cost	$31.00		

In other words, the 30% increase in production, without any reduction in wages or overhead, earned enough saving in wages and extra distribution of overhead to give you the base for a 22½ per cent price reduction. A careful trimming of expense accounts should enable you to take care of the remaining 2½%, effecting a total reduction of 25%.

In designing a box for a certain commodity or to serve a certain purpose the high piling hazard is often overlooked. Very often the specifications of material for a box do not call for lumber of a grade and thickness that will withstand the strains of high piling. Such a box might carry its contents safely under ordinary conditions, but might fail if stored in high tiers in a warehouse. The point is worth considering.

Departments Responsible for Own Showing

Woodworking Plant of Laidlaw Lumber Co., Organized Along Progressive Lines —Accurate Costs on All Work—System and Orderliness Outstanding Features

Many woodworkers operating a planing mill and woodworking plant in connection with a retail lumber yard must often wonder if the game is worth the candle. Sometimes it is and sometimes it isn't, for at times the yard makes all the profit and carries the planing mill, while again the plant carries the yard. The ideal way is where each department is able to stand on its own and show a profit at the end of the year.

This is what occurs in the case of the R. Laidlaw Lumber Co., Toronto, who operate a large planing mill and woodworking factory in connection with their West Toronto yard. Here the woodworking end is conducted as a separate industry and not only shows a profit but provides an outlet for a large quantity of lumber, being the best customer the yard has, brings trade to the yard and further assists by turning odd lines and slow-moving stock into saleable lines. To do that, it goes without saying, that the plant must be well equipped, highly organized and conducted along systematic, efficient lines.

View in Sash and Door Department.

Divided Into Separate Departments

In this particular instance the whole operation is conducted as three distinct departments or organizations, each independent of the other and each responsible for its own showing. The three divisions are yard and planing mill, factory proper, and warehouse. The yard, which consists of about 10 acres with numerous sheds and storehouses, usually carries a stock of some 7,000,000 of 8,000,000 feet of hard and soft woods consisting of Georgia pine, fir, spruce, pine, heavy timbers in such woods as oak, fir and Georgia pine, and such cabinet woods as mahogany, walnut, oak, etc. About 500,000 feet of kiln dried hardwoods are usually on hand. It is well provided with trackage, there being three separate sidings. A steel crane, which operates on the tracks, is used to handle heavy timbers, move cars and load the automobile trucks and teams.

In loading the trucks the material is first loaded on the yard carts or two-wheeled trucks. These are moved to a suitable parking area. When the empty truck returns to the yard, the crane lifts the load from the cart and deposits it on the truck. This cuts down the amount of time consumed in loading the truck, reducing idle time to a minimum.

Equipped for all Kinds of Work

The equipment in the planing mill consists of 2 power feed rip saws, 4 stickers and moulders, Yates planer, 16 in. jointer, 60 in. resaw, Woods timber sizer and dowell machine, together with the usual filing room and grinding equipment. An overhead crane is used to handle the material around the planer and resaw. This department takes care of all dressing, sticking, resawing, milling in transit and work of a similar nature.

The factory or woodworking plant proper is a modern up-to-date, well lighted, department. The work here consists of high-class interior work such as bank and office fixtures, interiors for residences and stores, veneered doors, panels, special doors, and sash, hand railing, newel posts and articles of a similar nature. The material for this work is all purchased from the yard, with the exception of the veneers, which are bought direct. This organization is divided into four departments; breaking out, sash and door, glue and veneer and bench.

In the breaking-out room the equipment consists of 2 rip saws, 3 cut-off saws, 10 in. Cowan sticker and a 26 in. planer. The sash, door and cabinet-making equipment consists of such machines as shaper, lathe, band saw, cut-off saw, Cowan moulder, 2 rip saws, 2 variety saws, Whitney planer, 2 jointers, 3 drum Yates sander, power door clamp, drum and disc sander, belt

sander, 2 hollow chisel mortisers and relishers, door relisher, band saw, 2 tenoners, chain mortiser, sash and door sticker, Kelly router, etc., while a Francis hydraulic press, glue mixer and hand presses comprise the glue installation.

System and Efficiency

All work is handled along systematic lines and there is a noticeable absence of congestion and confusion. In fact this is one outstanding feature of the whole organization and is due entirely to the manager, Mr. W. Warren, who might be termed a "crank" on system and efficiency. He has not, however, allowed his enthusiasm for orderliness to carry him away, with the result that while his organization is efficient and highly productive, it is not over systematized and top-heavy, as sometimes happens.

Cowan Sticker in Laidlaw plant. Note brightness of shop.

Whether one inspects the plant, yard, or warehouse, everything is as it should be. In the yard the lumber is piled on permanent foundations. The unit for piling is 4 ft. 4 in. wide. Each pile bears a tag which gives the particulars of the stock, pile number and date piled. A perpetual inventory is kept which shows the amount of material on hand and where located. Another feature is that small sheds are located at convenient places in which the piling sticks are kept. This increases the life of the stickers and does away with unsightly piles of sticks which are an adjunct of the ordinary yard.

Every provision is made to guard against fire. Hydrants and fire buckets are located at convenient points. In addition keeping the floor clean and free from litter lessens the fire risk. In addition to prevention and fire-fighting appliances a fire brigade has been formed among the employees, under the leadership of R. G. Millen. This brigade is drilled frequently and is prepared and trained for all emergencies.

Many H. P. Saved

The power plant consists of 2, 100 h.p. boilers and a 250 h.p. Wheelock engine. This is supplemented by a number of electric motors. Sufficient fuel, in the shape of sawdust, shavings and cuttings, is made to keep this plant going, and is forthcoming practically at all seasons. In fact a large proportion of the shaving made is baled and sold, some of it going to U. S. centres. The shavings exhaust system, which include separate units for sawdust and shavings, were installed by the Toronto Blower Co., Toronto. In connection with the distribution of power, it is interesting to note that all hangers are equipped with Chapman ball bearings. This installation has resulted in 70 h.p. being saved and applied to manufacturing purposes. Formerly the power plant was taxed to full capacity, but since the ball bearings were put in place, several new machines have been connected up, including a large fan, without overloading the engine.

The factory, planing mill and warehouse are steam-heated. A vacuum system, working under very low pressure and using exhaust steam, is the system adopted. The dry kilns consisting of a battery of 5 compartment kilns of the modern humidity type, with a monthly capacity of 150 feet, are also connected with the exhaust steam.

When an order for detail work is received, the order is made out in triplicate, one copy going to the shipper, one to the cost clerk and one filed. A shop order is then made out to which are attached sketches, blueprints, etc., and given to the shop foreman who in turn passes it to the detail man. This latter employee makes out cutting bill. The cutting bill and shop order follow the work through until complete.

Special Attention to Costs

An accurate account is kept of all costs. This applies to all departments and the different branches of the organization. The cost figures and cost recapitulation are carefully studied and analyzed in an endeavor to detect any weak spots or any operations

Francis hydraulic press for door and panel work.

which are costing too much. If any discrepancies are found, remedial measures are applied. This is using a cost system to the very best advantage, for it not only gives accurate figures on the various costs but really is used as a gauge by which the efficiency of the plant and its departments are measured and compared. These figures also give good information on which to base all estimates.

Some of the high-class jobs recently completed include interior fittings for the Bank of Commerce and Royal Bank buildings, Toronto, and for buildings erected by the Walkerville Land & Building Co., Walkerville, Ont., London Trust Co., London, Ont., Mutual Life, Waterloo, Canadian Woolens, Peterborough, Ont., Toronto Hunt Club, and others.

How to Augment Supply of Skilled Mechanics

Planing Mill Operator Outlines Views—More Attention to Training Apprentices—Co-operation of Technical Schools—Some Pertinent Suggestions

An interesting discussion with regard to the training of mechanics for the woodworking industry took place at the meeting of the Ontario Retail Lumber Dealers' Association held in Toronto recently. That this question should come up at all is a hopeful sign for it shows that the operators of planing mills and woodworking plants are aroused to the fact that some concerted action must be taken to ensure an adequate supply of skilled hands. It was brought out that the technical schools stand ready to co-operate to the fullest extent possible and it would seem as if the situation lies in this direction. Another point is that were the woodworking industry raised to such a level that higher wages could be paid, good men would be attracted to this calling. This can only be accomplished by close co-operation between woodworking employees.

Alex. Rhind of the Simpson Planing Mill, Toronto, who has given this subject considerable thought gave a short address as follows:

To re-open the question, which was touched upon at our last convention relating to the scarcity of well-trained bench and machine mechanics and the consequent lack of stability and production in the industry which we represent, and to create discussion here which may further ways and means by which the situation may be relieved.

Supply of Mechanics not Adequate

That this scarcity exists in normal times to our disadvantage is admitted and proven by the readiness with which an employee will lay off a day, rustle around to another shop, tell a story and get an offer of an advance in wages. He may start in the new job, but chances are that he goes back to his boss and states he has been offered more money. His boss meets the raise and the man stays till things look ripe for another touch, and believe me touches were close together last summer.

As to lack of efficiency, increasing and ever-varying costs in all departments in time required for stock or standard operations is proof enough. I think that, because we are not making effort to train beginners and men to our line of work, we are to blame. I think that we Canadians are away behind our old country folks in this regard. We are too busy, or we think we are, so have not taken the interest we should to add to the supply of help we have and need, or to replace those who work for us and who retire rich, start garages, grocery stores, real estate offices, speculative builders, etc. In view of all this, I think we might well discuss this question fully and take such action as we may decide will serve our interest.

Take an Interest in Beginners

I believe the printing trades have an understanding or agreement with employees, whereby all apprentices are indentured for a period of years at fixed wages, the employer advancing the apprentice as he becomes proficient, and after the first year he is sent to a Technical School as a part-time student at employer's expense. As the printing trades do not keep "open shop," I am not sure that this would be suitable for us to adopt, because the fixed purpose of "Organized Labor" is to retard production and their well-paid organizers are supplying a constant stream of propaganda to the end that labor may become scarce and dear.

Perhaps our better plan would be to each make an effort to place some beginners in our shops and factories and then to see that their interest was maintained, work not allowed to become monotonous for them and that they do not become discouraged through lack of interest, through interference or from insufficient wages. It would be a satisfaction to any of us to know that we had made a good mechanic and a useful citizen out of a beginner. Some say, "Well, a year or two, and just as he becomes of some use to me, here he leaves me and goes to work for Jones for a few cents more." Possibly, but then you may get one of Jones's boys for your shop. Jones can't keep all the boys unless he is like a superintendent of a concern I was with in Buffalo some years ago. This superintendent had a penchant for boys, and on our floor there were perhaps as many boys as men working. One day the boss, a little German, who was not at all a practical man, walked through and called to the superintendent. "John" he said, "Iss all dees boys voork by us?" John replies, "Oh, yes, some of them are growing quite smart too." "So, so," replies the boss. "Well, John, I giff you to understand right now dat dis is von sash and door factory I put my money in, I aint running no kindergarten." However, there is a happy medium in all things, and our shop here is a long way from being a kindergarten, at least in regard to the matter we are discussing.

Part of Time in Schools

In large centres, such as Toronto, Hamilton, Ottawa, in fact any of our cities, could not a scheme be devised whereby a boy could serve, say, a year or two with the concern and when he had acquired some knowledge and experience, be transferred to another shop and another until he became proficient and acquired confidence in himself.

Dr. McKay Offers Suggestion

Dr. A. C. McKay, principal of Central Technical School, Toronto, said that he had listened with interest to the remarks of Mr. Rhind and that they had opened up the whole question of industrial education. He said if the woodworking manufacturers felt that they were not getting sufficiently skilled apprentices they might take on three boys instead of two, and let the school have each apprentice a couple of half-days every week. The school would give them definite, special instruction and could do with them much better than the shops in teaching them to make and read drawings, etc. The expense of such instruction was borne by the citizens. Employing printers are doing this with those serving their time in the print shops, and woodworkers could do the same with their boys.

In the discussion which followed Dr. McKay's remarks, it was felt that the woodworking industry should take more interest and avail itself of more of the advantages of the school and that also men in the shops should take more pains and time in teaching boys.

Estimator or Guesstimator — Which?

Toronto, Feb. 22, 21.

Editor, "Canadian Woodworker,"

It is generally conceded that sash, door and interior woodworking plants are unprofitable investments, to be shunned by shrewd business men and hardheaded investors. As far as the memory of man can go back, and even further, we have records of hardworking men spending their whole lives, trying to build up a business in this line, and then going down into old age disappointed and discouraged because their dreams had never matured, passing out as poor, if not poorer, than when they commenced. Even today we see this same old, time-worn tragedy enacted.

How many woodworking factories can lay claim to be on a paying basis? There are a number who have been stimulated during the past few years by high prices and excessive business. When, however, the whole system is reduced to a normal basis and business is procured solely on competitive lines, I venture to say that a similar state of affairs, to those existing before the war, will be very much in evidence.

One naturally asks why this should be so? Simply because we have not kept pace with the times. The methods employed by our grandfathers have been handed down to us, and, I am sorry to say, retained in all their former crudeness, without even an honest attempt being made to improve them. Although every other line of industry has made rapid strides, whilst we, the custodians of this time-honored business, have been content to shamble along in a rut. This, of course, while applicable to a large majority of factories, is not true in all cases. We have some up-to-date plants in operation.

What is it that today is holding back the progress of our factories? Is it that we are content with an imperfect knowledge of our business, and that we do not handle it scientifically? Until this is remedied, we will not obtain the best results.

In every walk of life we must have a gauge or measure as our rule or guide. The cost system is our gauge in our manufacturing operations. Any firm operating without an up-to-date cost system is acting just as foolishly as the captain who tries to sail his ship without a compass. Without cost figures you can but hazard a guess as to the value of any piece of work. You might be right but more likely wrong. The cost system is the rule by which a modern estimator measures the value of the work he is estimating, and so without the same, estimating is only "guesstimating."

Very few factories know what their waste is on different types of work. I have had old experienced men tell me that 25% was the maximum waste on a given job, when I have proved it to be 45%. I have also seen high class joiner-work where the lumber value was 50%, and the labor value 50%, accepted at a price that barely covered the lumber value on a retail basis, the labor being practically thrown in. Such a state of affairs can only bring ruin, in addition to disrupting business and creating unfair competition. This would not likely happen if an efficient cost system were in operation.

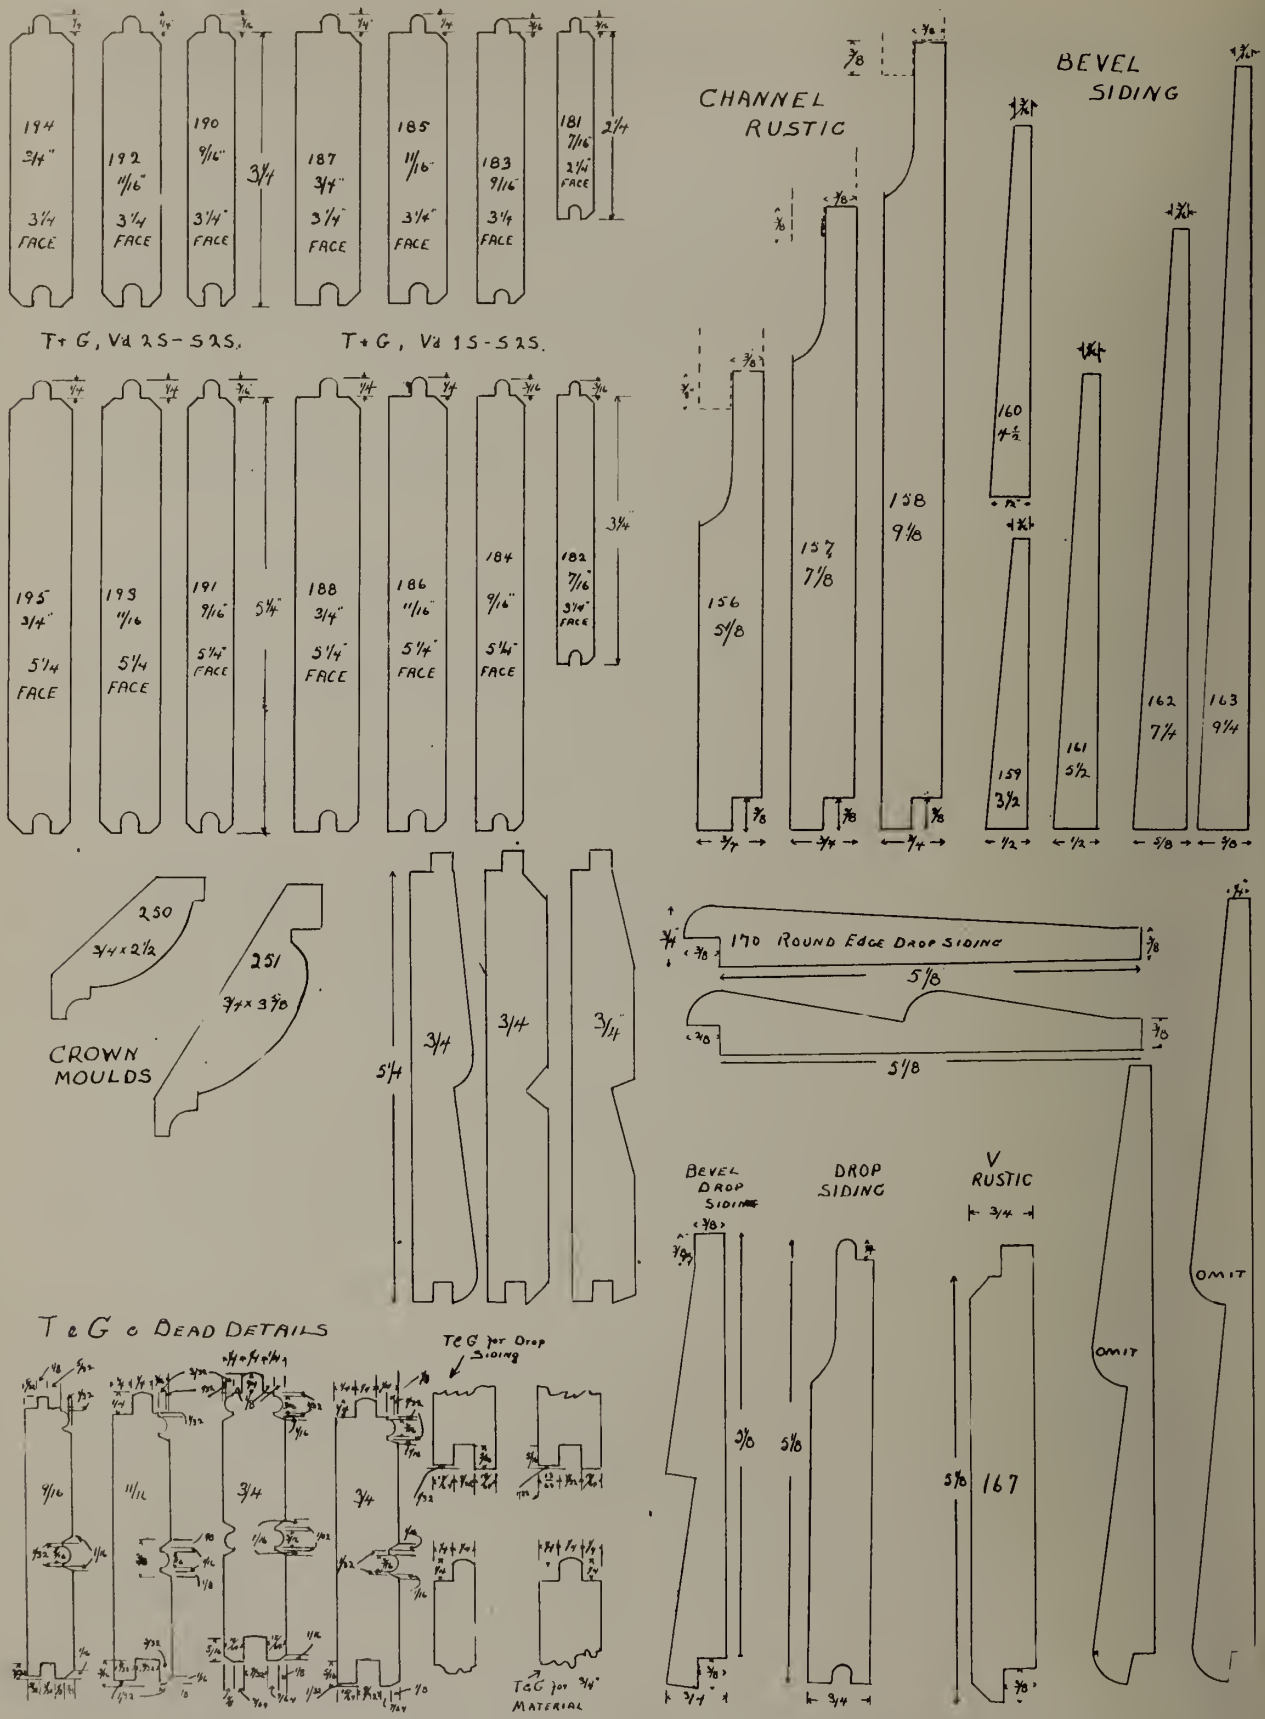
My advice then to all who operate woodworking plants is this:—"Know what your work is costing."

I am intensely interested in the woodworking industry; my whole life having been spent in this and allied lines. This article is prompted solely by a desire to serve my associates in our endeavor to raise ourselves to a more dignified plane; eliminating all elements of doubt and uncertainty, so that when slump periods are experienced, we may find ourselves firmly braced and entrenched and when good conditions present themselves, we will be able to make the most of them, handling our maximum of work, and to a large extent creating a reserve against less propitious times.

Should this letter prove interesting to your readers, I will gladly contribute again in future issues, entering into some of the details of cost, and outline my idea of a systematically operated plant.

Yours truly,

W. Warren.



Suggested designs and size for drop siding and sheathing in cluding details of tongue and groove.

Is Standardization of Mouldings Desirable?

Small Operators See Threat in Proposal to Adopt Uniform Designs—Advantages and Disadvantages of Such a Move—Uniform Door and Window Openings Desirable

By J. R. Weir

The adoption of standard designs and sizes for mouldings and other forms of woodwork is not favored by all woodworkers. This refers particularly to the smaller operators; for the larger organizations, those catering to a wider field, realize that it would be to their advantage to have uniform designs which were recognized and accepted by woodworker, contractor and architect.

The attitude of some of the smaller operators, and there is something in their contention, is that the universal recognition of certain basic designs and sizes would leave them at the mercy of the larger plants, which through larger output and, perhaps, better organization and equipment, are in a position to manufacture more cheaply and who, because of greater turnover, can operate on a smaller margin of profit. As long as each plant brings out individual designs, which are, at least, recognized and accepted in their immediate vicinity, just so long will they be able to compete successfully with outside competition.

Carrying this thought further the smaller operators consider that were they to purchase mouldings and detail work of that nature they would not have sufficient work to keep their plants going. In other words, the work involved in manufacturing such material is needed to provide a quota of the work for equipment and operators. What if they could buy this stock at a figure that would enable them to make a greater profit than if the material had been run in their own plants? One point is that the production of mouldings and trim offers an outlet for certain materials which accumulate around a plant and which does not command a ready sale. If this way of working up such stock were found to be unprofitable the material would probably have to be sold at a loss.

There is another phase to standardization and that is, would it result in reduced manufacturing costs and consequently a lower-priced product? Would such drop in the price of building material, for that is what it would amount to, have any marked effect on the building situation? It is claimed, and not without some show of reason, that if all the mouldings, flooring, doors, sash, frames, etc., could be standardized, it would effect economies which would have a marked effect on building costs, particularly residential work. This is particularly true with reference to the adoption of uniform doors and window openings, permitting the woodworker to cut all frame and trim material to the necessary sizes in quantities, taking full advantage of quantity production and eliminating a certain amount of waste, for such material could be cut to the very best advantage with a maximum of loss. On the job the work would be accelerated for all the carpenters would have to do would be assemble and attach the trim, etc., the cutting having been done at the factory.

A number of other advantages might be cited, but this article is not a brief in favor of standardizing but is written rather with the idea of informing the readers of the "Canadian Woodworker" as to the trend of events and of giving them something over which they may ponder.

In the past standardization was not practical and in fact, almost impossible of attainment. This was due largely to the way the contour of the sticker and moulder knives changed every time they were sharpened or ground. This was so marked that the shape of a moulding would undergo a decided change during a long run, unless the knives were removed at frequent intervals and reground to their original shape. Thus it often occurs that no two runs in the same plant, produce mouldings that correspond exactly in every detail. In any centre where certain designs and sizes had, through long usage, become recognized as sort of standard or stock designs, it is found upon comparing the product of one plant with that of another, that the variation in size and contour might run as great as ⅛ in. and even ¼ in., although these mouldings were ostensibly the same. This cannot be called standardization, for were these designs made uniform to one recognized pattern, the product of one plant could be placed end to end with that of another factory and would coincide in every detail without the minutest variation. It is this latter idea of standardization for which the various organizations behind this movement are working.

The manufacturers of knives and cutter-heads made a valuable contribution toward this objective when they brought out the special milled knives and cutters which are now on the market. Using milled cutters a plant on the Atlantic coast and another one on the Pacific coast could make mouldings which would agree in contour, without the slightest variation. There might be a difference in size due to the way the back was cut but the face members would be the same. If the manufacturers of milled cutters were to get together and agree on certain designs and thus to a certain extent standardize them, it would tend to gradually bring about a universal recognition and adoption of certain basic designs. In this connection it would be necessary to bring out standardized jigs and gauges which could be used as a means of comparing the product of one factory with that of another and which would ensure that the moulding turned out by each one corresponded in all detatils.

It makes little difference whether the woodworker or knife manufacturer takes the initiative, for the result would be practically the same in the long run. It would appear as if certain standards will through time, be adopted or accepted by the woodworking industry, and it certainly will be interesting to watch the developments along this line which may take place during the next year or two.

If every piece of furniture had to be sanded by hand what an army of boys some firms would have to employ.

What happens if the backs are higher than the front of the teeth; will the saw cut?

Circular Saw Greatest Hazard in Industry

Messrs. Tobin and Lovett, of Industrial Association, Tell Furniture Manufacturers Plain Truths in Addresses Given at Annual Meeting Furniture Manufacturers Association, Toronto—Employers Responsible for Large Percentage of Accidents—Compensation Board Requested to Take Action Against Worst Offenders

As I understand it, you are gathering here today for an annual meeting and, no doubt, during your deliberations you will rehearse the profits or losses of the past year and anticipate the results of your efforts for the coming year. Therefore, anything that will result in additional profit to yourselves or greater satisfaction in connection with your undertakings might ordinarily be considered an attractive proposition. I cannot promise to all of you that what I have to say is pleasant, but I think you will admit, after I have given you some information that I have here, that there exists a condition in your plants in Ontario for which you are, at least to some extent, responsible.

In the classification arranged under the Workmen's Compensation Act, what is known as Class 3 (embracing furniture, piano, organ and kindred industries) there were reported 655 accidents during 1920. The outstanding cause for these accidents may be named first, second, third, last and all the time, circular saws. One hundred and seventeen of these accidents happened on saws.

Attitude of Employees

Now we have among the firms mentioned, as near as we can estimate, about 25% who are willing to accept and put into practice any suggestions given them for the prevention of accidents. They have their saws guarded and they insist on the guards being used. The remainder are equally divided and may be classified as follows: 33 1-3% good promisers, 33 1-3% good arguers, and 33 1-3% willing to pass the responsibility to the workman.

In the first division of the above we find the manufacturer quite willing to procure guards and undertake to do what he always admits is necessary, but we find it quite difficult to keep him up to the mark in respect to his promises. We find 33 1-3% who are ready to exhaust every argument as to why their particular work will not permit the use of a guard. In this connection I may say that it was remarked recently by one of our inspectors that if the manufacturers would exercise one-half the ingenuity in devising a means to use a guard that they showed in demonstrating why one could not be used, they would be rewarded by a material reduction in the number of their accidents. The third class, who are willing to pass responsibility, are the gentlemen who say that they will furnish the guards but that their help will not use them. Now, gentlemen, we have reached a point where we can at least tell our help what we want them to do and if they will not do what they should do, they can be replaced. This was not the case two years ago.

Why this Variation?

I have some figures here that I will quote as an illustration of how far accidents may be prevented in your plants if you want to prevent them. I have before me a list of six firms taken from the accident record of your Class last year. I do not want to quote the exact number of employees for fear you may recognise which one of you gentlemen present may be the one I am describing. I will just use numbers to describe the firms. For instance, No. 36, whose accident record was .049%. Firm No. 15, .09%, nearly double. You will notice the next number, No. 23 with .20%, which is 15% higher than the first one. Firm No. 48, 10%. I have some real information for you in the last two. Firm No. 9, 56%, which means an accident during the year of more than one-half as many employees as he has in the plant. But the last number is certainly worthy of your close attention, No. 85. His record is 250% and 75% of his accidents were saw accidents. Now if you will analyse this last firm's record you will find that he hurt every man in the plant twice during the year and he got half way through on the third crop.

The question that I want to ask you, gentlemen, is this. Is it reasonable that you should pay an assessment to the Workmen's Compensation fund to support a condition of this kind?

Now, some of the manufacturers who are aware that they are taking the proper precautions and who know that their accident expense is far less than their assessment, have reached a point where they are uneasy about this condition and the remedy for it is this. First, to push the Board for penalty under Section 74, Para. 4 of the Act, and, second, to have them establish a surcharge on assessment for any manufacturer who operates a circular saw without a guard and when I say, "when he operates without a guard," I mean whether the employer considers that the man who operates the saw and takes the position that his fingers are his own and that he can use the guard or not, as he sees fit, ought to relieve him of responsibility; but, whenever a saw is found in operation without a guard and reported, the manufacturer will be liable to the surcharge tax. I will be followed by Mr. Lovett, who will lay before you some of the particulars concerning these factory conditions with which he comes in contact.

Seek Co-operation of Manufacturer

I want to ask you if you are willing to get in line in respect to having the Board adopt the surcharge that I have described, or will you wait until the manufacturer who has a good record forces the issue? There are two or three outstanding causes for accidents that are helping to build up this tremendous assessment for workmen's compensation, which amounted to seven million dollars last year. It is up to us to do something to cut down and circular saws which are one of the leading causes for accidents among our industries.

He was followed by Mr. Lovett, Safety Inspector, who was formerly an inspector solely for the Furniture Industry. He spoke as follows:

Mr. Tobin has given you some statistics which, I am sure, were of interest to you all. I would just like to say a few words to you as to your part in this campaign. You, as managers and superintendents, are

responsible for the manner in which your various plants are operated. You pay close attention to cost and production, but when it comes to accident prevention you pass that one to some one else and, if accidents happen, blame the worker for being careless while you yourself are the most careless one of all in that you have not seen to, and insisted on every possible means being taken to eliminate accidents and make your plant safe. True, you have provided guards, but have you taken the trouble to see that they were suitable for the work in hand and that the workman used them properly? If you have not, then you have been very careless.

Insist on Precautions Being Taken

Figures were also presented on saw accidents, showing the saw to be the outstanding hazard in the wood-working industry, but gentlemen, if you will it, you can eliminate 75% of these accidents in two years. So often I go into a plant and find a man operating a saw with his guard six inches above the saw. I call the superintendent's attention to it and his reply is, "Well, there is the guard. What more can I do? If the man wants to take a chance, that is his business." He acknowledges right there that he is not boss, or that he is careless and indifferent to the safety of those in his charge. This applies to all machines, saws, jointers, shapers, etc. The guard is taken off or shoved to one side and nobody seems to care or notice it, until the inspector comes around and then the man gets the blame. In reality, it is simply lack of supervision. That is where your carelessness comes in again, in that you do not insist on your superintendents or foremen taking more interest in this phase of their work. No standard type of guard can be used for all the various operations on any machine, except perhaps the rip-saw or jointer, but that does not mean that guards cannot be provided for all operations. So many employers, because standard guards cannot be used, simply throw up their hands and say "It can't be done," forgetting that his own employees have brains and might devise a guard for any particular operation. Some of the wise ones have done this and their accident record shows the result.

Educating New Employees

Another feature that must receive your attention is the education of new employees. As a rule they are given a few rudimentary instructions and left to learn the rest from experience, which is costly to the firm and so often to the man himself. He receives a serious injury and is blamed for being a careless man when in reality, it is the supervisors who are careless in not showing the workmen how to work safely.

Mechanical guards will only prevent 25% of your accidents. The other 75% can be prevented by carefulness. See that good, practical guards are provided. See that they are properly and consistently used. Eliminate the chance-taker. Make your factory clean, bright and cheerful and invite the co-operation of your employees. Let them know that you are interested in their safety and welfare. Check up any accidents you may have and place the responsibility where it belongs, on the manager, superintendent, foreman or workman. Insist on every workman receiving first aid, no matter how slight the injury. Invite suggestions from your employees for ways and means of making your plant safe and you will get results that will be most gratifying.

Take Action Against Offenders

At the close of the above address it was moved and carried:

"That in view of the serious number of accidents occurring in some few industries associated with us in Class Three, which re-acts against the whole furniture industry, we, the members of the Furniture Manufacturers' Association, recommend to the Workmen's Compensation Board, the enforcement of clause four, section seventy-four, regarding special penalty against any such industries."

Do You Take Orders at Other Fellow's Price?

He May Know His Costs and Again He May be Guessing—Should be Greater Uniformity in Quotations—Increased Cost Knowledge of Untold Benefit to Industry

By Geo. H. Most*

Modern business can not tolerate unproductive or unprofitable departments or units, and accounting machinery that will reflect not only the loss but also indicate why and where it occurred is indispensable. In the millwork industry many instances have been brought to light through cost accounting where the lumber yard was returning a very satisfactory margin while the mill had been operating during its entire existence at a dead loss. We have also found that many mills failed to return properly to the investors because the profits realized in the machining department were nulified by the results obtained in the bench or cabinet and stair departments.

The elimination of loss is a rather perplexing problem for the millman. Unfortunately, in the past too many millwork producers were deluded by two common fallacies: (1) That they could always afford to take the bill at "the other fellow's price" and (2) that the estimate price was of rather secondary importance, because the deficiencies of the estimating department could largely be overcome by increased efficiency in the production department.

The first condition results almost directly from a realization on the part of the millman that he does not know the cost of his goods and feels, possibly, that rather than lose the sale he can afford to take a chance that his competitor has intelligently compiled his quotation. In the past, with the majority of millmen suffering from a lack of cost of knowledge, the accepting of a bill at the competitor's price simply meant the absorption of his shortcomings, and in many cases an accompanying loss.

The second instance outlined above is a fallacy indeed, for if sufficient of your product is sold at less than cost of production ultimate failure is in store, regardless of the efficiency of your factory or increased production. It is obvious, therefore, that the crux of the entire situation is knowing your cost so that your estimates may be based on actual cost, instead of on theory and guesswork. The sale price of millwork is merely a combination of the factors of cost and

*Address at Grand Rapids, Mich.

profit. If the cost is not intelligently arrived at, the average sale price will no doubt prove very unsatisfactory.

Elements That Determine Cost

Four factors enter into the cost of millwork; viz., material, waste, direct labor and overhead or burden.. Outside of the fact that a few mills still fail to realize that waste in cutting lumber ranges 10 per cent on southern pine to 40 per cent on white oak, almost everyone is quite familiar with cost, with the exception of the item of overhead or burden. This is by far the most elusive factor of cost, as both the compilation and application must be scientifically performed. In many industries this extremely vital problem must be met and disposed of by the individual operators. For many years the sash and door and millwork producers were similarly situated. Today, however, the subject of millwork cost is handled collectively through the institution which I represent—the Millwork Cost Information Bureau, of Chicago

Our association is the recognized authority on costs and estimating procedure in the millwork industry and in addition to supplying our membership with estimating cost schedules based on actual cost experience of our members, we have combined the meritorious features of all the cost systems existing in the past in member factories and have evolved the "Standard Cost Finding System."

Apportioning Overhead or Burden

Under this system the usual burdensome task of analysis incident to the termination of a period is eliminated by the arrangement of the ledger accounts, so that all expenses are properly classified, and the burdens are in reality compiled by a daily analysis effected by postings to properly subdivided expense accounts. At the end of the period the various expense totals are distributed against the proper burdens, so that a lumber burden per thousand feet is determined, also an hour burden for machines and benches, and a percentage of production cost for commercial burden. On account of the fact that both expensive and cheap material is to be considered, and that the nature of machine and bench work is diametrically opposite, it has been found advisable to divide the total overhead or burden into four parts, and also to apply each as a "unit of measure" wherever possible instead of on the percentage basis.

The foundation of each of the four burdens is the group of fixed expenses, including taxes, insurance, depreciation and interest on investment. These are prorated against the proper values in the various departments. The rates of depreciation used for machinery, buildings, autos, tools, etc., are those universally accepted by the best accounting practice.

Factors to Consider in Fixing Burden

Interest on investment is included as an item of cost in burden compilation but is not carried into the bookkeping as a regular item of expense, as a false profit would thus be created, which would prove to be misleading.

In addition to the fixed charges the lumber burden consists of handling expense, composed primarily of yard rent, repairs, labor, team and hauling labor and lumber purchasing expense. The kiln burden would be established in a similar manner, adding, of course, a part of power for heat.

Before it is possible to compile the machine and bench burdens it is necessary to arrive at a general factory overhead rate per hour. This overhead is merely used temporarily by the auditor in the compilation of machine and bench burdens, and consists of all items of expense not chargeable directly to either machines or benches, such as fixed charges applying to mill land, buildings and stock, also wages of foremen, watchmen, truckers, sweepers, superintendent and expense of stationery, time cards, water and light bills, etc. These expenses are totalled and charged against the machines and benches on the basis of direct hours worked in these departments. To this rate per hour is added an hourly rate, which will cover distinctly machine expenses. The total will equal the machine burden per hour.

The machine expenses referred to above would include—besides machine fixed expenses—a part of power, machine repairs, supplies, knives, oil, grease, etc. The bench burden is compiled just as is the machine burden; that is, the hourly rate covering bench expense is combined with the general factory overhead.

The commercial burden consists of all expense items exclusive of production costs: Warehousing, packing, delivery, office and selling. The expense items consist of fixed charges applying to warehouse and office property, also labor supplies, salaries, and items such as postage, telegraph, advertising, bad debts, etc.

Special Conditions May Create Other Burdens

For the average odd millwork factory, we recommend only these burdens enumerated above, but if conditions necessitate, other burdens may be developed to apply to each individual machine, or to departments considered as a unit. The question is often asked, why it is not possible to apply burden in one operation which will cover all expenses in the various departments. This procedure has been found to be very inaccurate and unsatisfactory; in fact, it constitutes a perilous procedure where the type of product and value of material are subject to wide variation. In reality, any system of burden application which fails to provide for an equitable distribution of overhead when products of a diversified nature are involved, defeats the real purpose of a cost system. It is necessary, therefore, to subdivide the total of overhead expense into a sufficient number of parts so that only a combination of such parts may be applied as is in reality required for the time under consideration. For instance, a burden of $50 a thousand on all material used would not be equitable for both machine and bench work, because, while machine work, such as molding, involves much material as compared to labor, the bench work or cupboards and stairs involves just the opposite proportion; that is, a very small amount of material as compared to the labor required. It is also obvious that the material required for an item bears only the slightest relation to the burden factor, so in general this plan is hardly feasible.

Why General System not Applicable

Another conspicuous example of improper burden application is to consider all overhead as being equal to 50 per cent of the material involved. In the event that a quantity of molding manufactured of southern pine were to be changed to mahogany, the burden would increase in the ratio about 1 to 3, according to the exact value of the material, whereas the running of mahogany molding would in reality occasion but very little extra expense.

A number of other methods of burden application

involving but one operation could also be cited, which are open to serious objections just as are previously mentioned. It is obvious, therefore, that not only the compilation but the application of overhead is of very serious import.

Before concluding, it may be well to dwell briefly on the necessity of cost work in general. In our industry, which, admittedly, is forced to contend with an extremely diversified and complicated manufactured product, we are peculiarly situated in that we are required to quote on the larger part of our output, sometimes months in advance of its manufacture. To compile a price on a complicated cupboard, stair or piece of panel work, that will be sufficiently low to secure the order and amply high to cover cost plus profit, is indeed a science. A thorough knowledge of construction and material is required, together with a well defined idea as to the probable amount of labor and overhead that will be consumed. Overhead has proved to be just about as large a factor of cost as direct labor. This being true, is it not a fact that burden should constitute a subject for discussion among executives equally as much as your wage scales and rates?

Wide Variations in Quotations

It has been proved in the past, that, primarily, through the lack of knowledge pertaining to material wastes and burdens, estimates on odd millwork have varied consistently between 20 and 300 per cent. A large part of the production of the industry was annually sold at considerably less than cost, with the natural result that an extremely large number of mills have found their investment to be in reality inferior to an investment in a first-class mortgage. The fact that at present over four hundred and fifty mills of various sizes, involving the major part of the industry, are associated in the interest of cost research and cost acccounting should furnish convincing proof as to importance of cost in this industry.

It is difficult to conceive of an enterprise so simple as can not be greatly benefited by knowing cost. To proceed without a knowledge of your cost is very similar to an attempt to erect a large building with an imaginary or unstable foundation. Our observations have proved that uniform cost finding methods are in many ways a distinct advantage to an industry. Each firm can then talk in common language and the efforts of all can be centralized.

I trust that those who have in the past disregarded their costs will give this important matter due consideration, and I know that once you have realized the tremendous advantages accruing from cost research, you will forever afterward be an ardent advocate of everyone knowing his costs.

D. R. Brewster Defines Good Kiln Drying

One Woodworker Lost $10,000 Annually by Not Being Up-to-Date—Features Necessary to Successful Drying—Operator Must Know His Work, Kiln and Wood

By D. R. Brewster*

Every woodworking plant naturally desires to bring its kiln drying practice up to a point where it will give maximum satisfaction and service. But kiln drying which is satisfactory at one plant, may be very unsatisfactory at another plant, which uses a different kind of wood or makes a different class of product. In other words, kiln drying requirements differ widely according to the species of wood to be dried, the thickness of the lumber, the grade of the lumber, the product to be manufactured, the number of different kinds of wood and the amount of each to be dried, the moisture condition before drying, the final moisture content desired, the permanency of the plant and many other factors. In order that you may know what constitutes good kiln drying at your plant, you must take all of these various factors into consideration and draw your own conclusion in the light of what I am going to tell you about good kiln drying in general.

The subject of kiln drying may be divided into two main divisions—first, the kiln, and second, its operation.

Each type of kiln has its friends and its uses. Every kiln company will give you a long line of "talking points" calculated to show how and why its particular kiln will give you best results and be best suited for your purpose. But when all of these points have been viewed in the light of common sense and particular experience, it will be found that there are only a few really necessary features in a good dry kiln and no one has a monopoly on any of them.

In the first place you need a building. This may be either brick, concrete, tile or wood, depending upon relative cost, permanency desired, fire risk allowed and amount of initial investment possible. For the permanent woodworking plant, probably a substantial fire proof building of brick and hollow tile will prove most satisfactory in the long run. Wooden kilns, on the other hand, have many good points in their favor, such as cheap and rapid construction, excellent insulating properties and portability. But no matter what material is used, any building will be satisfactory if it is tight and reasonably free from the influence of outside weather conditions. The building is, in fact, the least important factor in good kiln drying—any building with four walls and a roof can be converted into a good kiln at reasonable expense.

Having the building, you must provide some sort of heat. A great deal of lumber has been well dried in the past with nothing but warm air from a stove, or even an open fire. In the modern practice, however, this method does not recommend itself for drying expensive lumber, because of fire risk and difficulty of control. In the small shop good results are obtained by keeping stock in a warm corner near the ceiling, where it will gradually dry down to the proper condition. For most purposes, however, steam is much the most satisfactory form of heat, furnishing high temperatures with reliable and accurate means of control. Some kilns have steam pipes within the kiln while in other types the air is first heated by radiators outside the kiln and is then blown into the kiln and through the lumber by forced draft. Each method has its advantages under certain circumstances.

After heat, the next requirement for good kiln

*Address, Woodworkers' Club, Louisville, Ky.

drying is some means of introducing moisture into the air to prevent the outer surface of the wood from drying too rapidly so as to cause checking and case-hardening. This is sometimes done by evaporation from an open water surface or by spraying the air with water. But for ordinary requirements the most satisfactory method is to inject steam into the air in the kiln through perforated steam spray pipes.

The heated and moistened air must then be carried to the surface of the lumber to be dried so that the heat can do its work of evaporation. Evaporation of water consumes heat just as operating an automobile consumes gasoline, and the amount of drying that takes place is directly proportional to the amount of heat supplied to the lumber. To provide the heat required for rapid drying the heated air must be made to circulate freely between the boards.

There are two ways of obtaining this circulation—the natural draft and the forced draft. The natural draft takes advantage of the fact that heated air is lighter than cold air, and consequently rises, because of gravity. The lumber in natural draft kilns is therefore placed above the source of heat so as to be in the path of the rising heated air.

Forced draft kilns drive the heated air between the boards by some mechanical means such as a fan or blower or a high pressure spray of water. They usually also take advantage of the natural tendency of heated air to rise. It is necessary, however, to limit the velocity of circulation in forced draft kilns, as too high a velocity will dry the outer surface too rapidly, causing checking and casehardening.

Removing Moisture From Air

After the heated air has done its work of evaporation, it has lost some of its heat and picked up a corresponding amount of evaporated moisture. In an absolutely tight kiln this process would eventually increase the moisture in the air to a point where no more drying would take place. Consequently, some way must be available for removing the excess moisture before the air returns to the lumber. In the ventilated type of kiln this is done by removing some of the moist air through openings or stacks and replacing it with fresh air from the outside. In what are known as "re-circulating kilns," moisture is condensed out of the air like dew, either by cold water pipes, cold water sprays or canvas curtains where the air outside of the curtain is colder and drier than that inside the curtain. In the ordinary kiln the cold air which enters through cracks and holes around the door is more than enough to provide for removing the excess moisture, and the common problem is to add moisture to the kiln air rather than to remove it.

More or less casehardening will usually develop in spite of precautions. It can be relieved by softening the outer surfaces of the boards with hot, moist air. This is done by injecting a large amount of steam into the kiln for a few hours up to the point where the wood absorbs moisture or even until the air is saturated. Either live or exhaust steam will serve this purpose, but live high-pressure steam injected through an open steam pipe gives the quickest and most satisfactory results.

Having first the building, second, the heat, third, the means of moistening the air and steaming the lumber, fourth, the circulation of air, and fifth, the provision for removing excess moisture, the kiln is complete, and only requires intelligent operation for good results.

Proper Piling is Indispensable

Proper piling of the lumber is the first requirement of correct kiln operation. A level and solid foundation is necessary and enough stickers should be used to prevent sagging and warping and support the ends of the boards. The stickers should be of uniform thickness and placed one on top of another in straight vertical rows. It is also very important to place the lumber in the kiln in such a position that the air can circulate freely between the boards without interference from the stickers. That is, if circulation is crosswise of the kiln the lumber should be flat piled lengthwise of the kiln. Openings between the boards or chimneys in the interior of each truck load should also be provided to allow the heated air to rise upward through the lumber.

Temperature control is the second essential of good kiln operation. Some woods will safely stand much higher temperatures than other woods. For certain uses, such as in airplanes, where maximum strength is required, temperatures must be limited to not higher than 135 or 145 degrees Fahrenheit. For table tops, the same woods might be satisfactorily dried at temperatures as high as 180 degrees Fahrenheit, or more. Temperatures must be varied also to suit the moisture in the wood. With green wood much lower temperatures are necessary than with wood that is nearly dry. Most satisfactory temperature control is obtained by thermostatic valves placed on steam heating pipes. With close attention on the part of the operator, however, good results can often be obtained by hand-operated check valves and pressure-reducing valves.

The moisture or humidity of the air must also be under control in order to obtain most rapid drying and at the same time avoid checking, casehardening and honeycombing. Such humidity control is best obtained in the ordinary kiln with a thermostatic valve on the steam spray line operated by a wet wick. It may also be obtained by a hand-operated steam spray valve or by varying the temperature of the water used in water sprays or condensing pipes.

Make Frequent Tests

Since the temperatures and humidities to be used will vary with the amount of moisture in the lumber, good operation requires tests, to determine what the per cent. of moisture is, both at the beginning of the drying and at intervals during the drying until the lumber is fully dry. Such tests are made by weighing sections cut several inches from the exposed end of the board, then dry the sections until no further loss of weight occurs and then dividing the amount of loss by the final weight to get the percentage. These moisture tests must in many cases show not only the average moisture, but also the amount in the centre of the boards as compared with the outside. Too great a difference is a danger signal indicating the development of casehardening and of honeycombing. Many moisture tests are incorrect, because the test sections are cut too thin or are not dried long enough or are dried at too high a temperature. Accurate tests can be made with test sections not less than ½-inch thick in direction of the grain dried for not less than 24 hours, with temperatures not above 220 degrees Fahrenheit. Careful testing requires a balance with a capacity of 200-300 grams sensitive to 1/20th gram.

In order to know when to soften the lumber by steaming when casehardening develops, tests for casehardening are also necessary at certain critical stages of the drying. Such tests are simple and can be easily made by resawing into three-eighth inch strips a ¾-inch section cut from the interior of a board. If the outer prongs or strips pinch inward severely a seriously casehardened condition is indicated.

Both moisture and casehardening tests are most necessary when trying out new kilns or when drying a new species or thickness of lumber. As the operator becomes familiar with the kiln and kind of lumber concerned, he can gradually eliminate much of the testing which was necessary at first.

Relies on Experience

But to reduce the amount of testing safely and intelligently, the operator must keep careful, adequate and permanent record of his kiln operations. These records should include first, a description of each kiln charge, giving the amount, kind and thickness of lumber, where it came from and how it had been handled before it reached the kiln. Then, for each kiln run, accurate thermometer readings should be taken once or twice a day or oftener, showing the temperatures and humidities of the air, particularly at the hottest and driest point in the kiln. In formation on manipulation of valves and ventilators and other control apparatus should be recorded along with temperature and humidity readings. A record of the results of all moisture and casehardening tests should also be kept, together with the temperature and duration of steaming treatments given to relieve casehardening. Records of this kind will provide the basis for intelligent improvements in kiln operation and are very essential, if maximum results are to be obtained.

In addition to keeping adequate records, the operator must also constantly study his kilns, looking for ways to improve results and reduce drying time. The efficiency of any kiln is measured by the uniformity of the drying. No matter how rapidly the lumber may dry at one point, the charge cannot be removed until all parts are dry. Consequently, the entire charge may be held up by some slow-drying portion in a part of the kiln where circulation is sluggish or temperature and humidity conditions are not right. These slow-drying points must be discovered by means of smoke tests showing the direction of air circulation and by moisture tests of the lumber in different parts of each kiln. Uneven drying must be corrected by necessary alterations in the design or equipment of the kiln before satisfactory results can be obtained.

After considerable experience in inspection work, I have come to the conclusion that all kiln-drying operations can be classified into three groups.

Fool Proof Class

The first group I will call the "Fool Proof Class." This class seeks refuge from the bother of the kiln-drying problem by working out a method which will practically take care of itself with a minimum of attention, small direct expenditure, and low-priced, unskilled labor. Simplicity is the watchword of this class. They look at the drying of lumber as they would look at the drying of the weekly wash on Monday morning in the back yard—an essentially simple operation, not deserving of any particular attention of thought.

This class got along with air-dried lumber as long as they could. When they finally became convinced that kiln drying produced a better product, they installed the kiln which promised to do the work with the least amount of direct expense and attention. The simpler the process, the better it suited them. They wanted their kilns "foolproof"—so simple that any yard hand could operate them, and so nearly automatic that the operation consisted merely of putting lumber into the kiln, turning on the steam and taking the lumber out again. Since this class has always neglected the drying operation and the whole matter of moisture in wood, they have not in many cases realized the large indirect losses which often result from this simple foolproof process and have therefore been fairly well satisfied with the results obtained.

Example of "Foolproofing"

Not long ago, I visited a furniture plant which is a typical example of the foolproof class of kiln operations. The plant was built some 40 years ago on the outskirts of a town which has now grown to be a city for miles beyond. A large yard area was provided for air-seasoning and it has always been the practice of this plant to leave all stock in the yard on sticks for six months to a year before going into the kilns. Progressive kilns were built 25 years ago, sufficient to hold a month's supply of lumber with the plant running at maximum capacity. A limted heating surface was provided sufficient to give a maximum temperature of about 135 degrees in the kilns.

The method of operation at this plant was simplicity itself. The lumber was never more than 2 inches thick, and mostly 1 inch. After being first air-dried at the mill and then air-dried six months or more in the yard, it was always dried down ot a uniform moisture content of from 12 to 15 per cent., when it was placed in the kiln. The door was then closed and the heat turned on. With such a low moisture content and such low temperatures, most species of lumber may be kiln dried without much damage, in almost any kind of a hot box or heated building. The stock at this plant was consequently in fairly good condition when taken out at the end of a month or six weeks in the kilns. It was always fully dried and ready for use when needed, since it had been left in accomplish the drying.

I have never visited a plant where the ideal of simplicity and fool-proofness of kiln operation was more nearly attained than at this furniture factory. Yard hands loaded and unloaded the kilns; the engineer turned the steam on and off; the shop got the stock when it was needed. No moisture tests were necessary, no casehardening tests, no steaming treatments to relieve casehardening, no high-priced, trained operator. The kilns practically ran themselves and produced results which satisfied the plant.

Unnecessary Annual Cost $10,000

This system has its advantages, I will admit, yet it also has a very great fault—a fault that is almost universally overlooked by the advocates of such foolproof kiln drying. That fault is unnecessary cost. Let us take this same plant as an example.

In the first place, preliminary yard drying for from six months to a year required the carrying of from 500,000 to 700,000 feet of lumber ahead at all times over and above the amount needed to provide a reasonable reserve against delays in shipment.

This stock was piled on valuable land in the industrial district and it is estimated that the value of the excess stock of lumber and piling space would aver-

age at least $30,000 over the last ten years. Interest, taxes, insurance and depreciation would at least be 8 per cent., or $2,400 yearly. In addition, there would be an extra charge for piling about 1,000,000 feet of lumber each year, which even at pre-war prices would amount to at least 60 cents per thousand, or $600 more.

Now, coming to the kilns, we find that the kiln space provided is more than twice the amount really needed. We will forget the double investment in land and buildings and consider only the loss from the heating and operation of double the kiln space required. The costs of kiln operation were never kept s parate at this plant, so we can only estimate. We do know, however, that with pre-war costs of coal and labor, a representative cost for kiln-drying one inch air-dry lumber was five dollars per thousand, exclusive of handling charges. By leaving the lumber in the kiln two or three times longer than necessary, it seems fair to assume that it cost this plant an additional $5 per thousand, or $5,000 a year in kiln operating costs.

Now take the stock as it comes from the kiln when dried in this fool-proof way. It is invariably casehardened to some extent, even when thoroughly air-dried before kiln-drying. In the furniture plant, this casehardened condition causes loss all through the machining and finishing processes, and even after finished goods are sold and put in service, from twisting, warping, surface-checking, opening of glue joints and shrinkage. Losses from this source have been known to amount, in some cases, to from 10 to 20 per cent. of the original rough lumber. Not only the material is lost or has to be reworked or patched, but also much of the labor expended on it is also wasted. In a plant of this size, the factory loss from casehardening can safely be assumed to have been at least $2,000 per year.

Summing up then, we have in the yard, kilns and factory an average total amount of more than $10,000 per year, which it has cost this plant in conducting its seasoning on the fool-proof plan. This amount would have been sufficient to thoroughly remodel the old out-of-date kilns, pay a competent operator to look after the kilns and still have a handsome surplus at the end of each year.

(Continued in April issue)

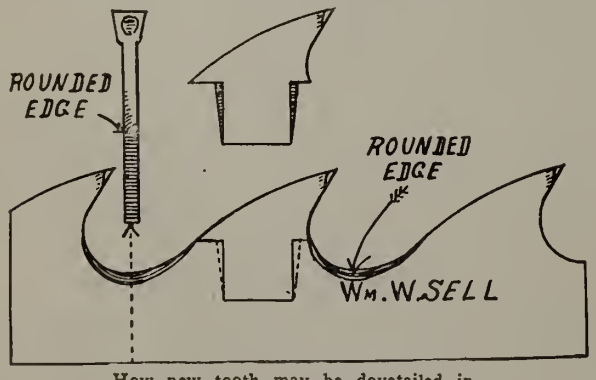
Replacing Broken Teeth in a Resaw Blade

Advisable to Attach New Teeth Rather Than Cut Saw or Operate with Teeth Missing--Two Methods Often Followed

By Saw Filer.

One or a number of teeth are often knocked out of a band resaw or band mill blade, owing to striking such items as bits of rock, spikes, and pieces of iron or steel, embedded in the wood. When this happens some filers cut out the missing teeth, brazing the ends together or, in some instances, brazing a short length of blade, others chip down and retooth the blade. The newer method is to braze in new teeth. This can be done in several ways.

Brazing in new teeth was discussed by several filers, in a recent issue of the "North American Filer." One writer maintained that no matter how perfect a braze might be made, it was bad practice to cut the saw and rebraze. His method of fitting new teeth is illustrated in the accompanying sketch. By a little



How new tooth may be dovetailed in.

study of same one can readily see the advantage of perfectly repairing a few teeth so that there is no danger of accident in the grinder, so that smooth lumber will result.

Dovetailing New Teeth

First prepare your laps in the stub teeth, being governed by the spacing as how much surface to allow for brazing. The illustration is one and five-eighths spacing. On a two-inch spacing one can have a much wider lap but not any deeper. If the depth is greater, it merely is an invitation for a crack alongside the dove-tail and also the longer time to wear the tooth out into good steel. Take particular notice to prepare the shoulder on each side of the lap on stub tooth for strength and to fit the tooth over this so that when it is finished it will be smooth and a full tooth.

After the tooth is brazed and the tension re-adjusted so that there is no danger of a fracture in this place, it can be placed in the grinder and finished the usual way. Swage these teeth and then always keep them filed down about one-thirty-second of an inch. This will protect them from heavy work and knots. After this is all finished and the saw ready for the wheels, take a half-round file and file out the throats of the brazed teeth, like illustration, on the outside of saw. This will protect the throats from fracture. The writer uses this method also on the braze throat and the tooth on each side, with the result that very few brazes are made.

With a little practice one can put these teeth in quickly and so they cannot be found. If one feels a little afraid to try it the first time in a saw, take a piece of plate a foot long and cut out a couple of teeth and fit and braze in new ones. They will stick.

Prefers Oxy-acetylene Weld

Another filer who has been conducting a few experiments with a view to finding the best method of salvaging and repairing oxy-acetylene blow torch. A short time ago a 14-gauge double-cutting saw was driven into a railroad spike and came out with 35 teeth broken off close to the blade. These teeth covered a continuous space of about five feet on the saw. Teeth were taken from an old saw and welded with an oxy-acetylene blow torch to the stubs, which had previously been straightened. Former experiments had shown that teeth welded in this manner were liable to prove brittle and more apt to break than

original teeth in a new saw, so to overcome this and make the teeth stronger and more pliable, a pair of blacksmith tongs were heated red hot and clamped to each tooth separately. Tongs and teeth were allowed to cool gradually while clamped together, thus annealing both tooth and weld. With a little filing on the welds, teeth were true enough for the "gummer" to put in perfect size and shape. This saw has been run at least six times since being repaired and so far no defects have developed. It is almost impossible to detect where the new teeth have been inserted.

Broken teeth have been successfully replaced in 16-gauge saws, usually four or five in a saw. In one instance 28 new teeth scattered over the entire length of a 34-foot saw were inserted, and every tooth, after several months of wear, is still perfect. Many times teeth have been built up one-fourth of an inch with nickle steel and an acetylene torch. These swage and wear just as perfectly as original teeth.

Works Out to Good Advantage

These experiments have been distinctly worth while. Without this process, where a number of teeth were broken off, the saw would have to be clipped down and retoothed, leaving only about 1 1-3 inches of wear in a new double-cutting saw. Electric welding has been tried, but heat can be controlled more perfectly with an acetylene torch. Saws will occasionally crack near the cutting edge and experiments are being made to sew these cracks and anneal them with a torch.

In a large plant operating, say, four double-cut band saws and two horizontal resaws, each carrying a working equipment of 12 saws for 20-hour shifts, the upkeep, repairs and renewals is a big item, the renewals alone costing approximately $1,500.00 each month. With these new repair methods, the life-time of the saw is lengthened, and each saw actually wears down until too narrow for the wheel before going to the junk pile. As long as a saw is wide enough to run, all breakages are repaired and each saw runs as true and cuts as perfectly as when it first leaves the factory.

In a short time a complete welding outfit will be installed in all filing rooms and become a necessary part of the filing equipment, thus reducing the upkeep and saw expenditures very materially.

The Electric Drill and Screw Driver as Means to Greater Production

By H. B. Beattie

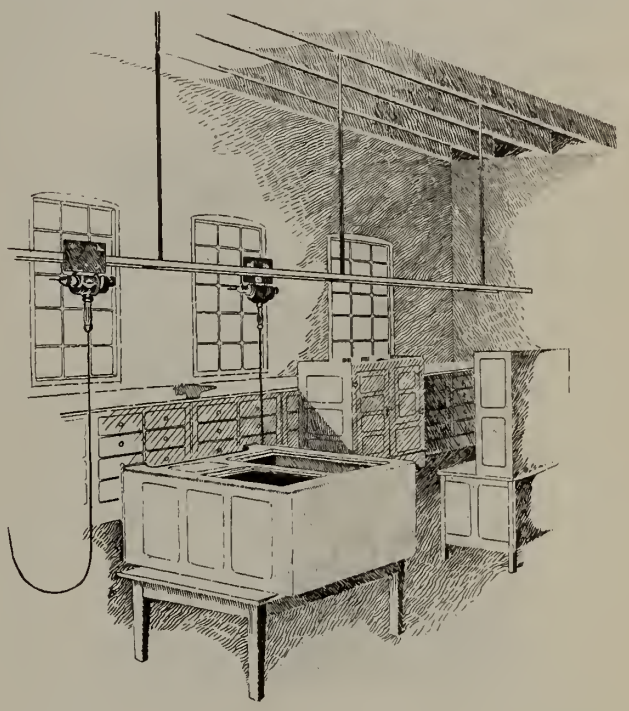
The accompanying illustration shows an installment of the above tools in the trimming room of a plant where refrigerators and kitchen cabinets are the main products.

The tracks on which the hangers that hold the tools travel are suspended from the ceiling, the supporting pieces being of ½ in. piping, the track itself is of flat iron 1¼ in. x ¼ in., the upright supports being placed 7 ft. apart.

The plate on which the wheels are fastened is 8 in. x 5 in. x ¼ in. There are three wheels, two on the top and one below; the top wheels are grooved on the rim to fit the ¼ in. track, the lower wheel is flat on the edge and is merely to keep the top wheels from jumping off the track, it being set sufficiently close to the lower edge of same.

This carriage will have to be shoved on to the track from the end. Through the ends of the track a pin is put which prevents the running off of the carriage. The outside face of the carriage plate is provided with two iron hooks that are rivetted to the plate, these conform to the shape of the electric tool and hold it securely when not in use. The track is made so as to be nicely clear of a tall person and the tool can be easily reached when needed.

The ease with which the carriage runs along the track makes it readily accessible and as the handle of the tool hangs down it is easily reached. The slack



Efficient installation for electric drills and screw drivers.

in the electric cord can be taken care of by a small counter weight attached to a cord that runs over on a hollow faced pulley, which is tied at proper place to suit requirements.

This installation is a great time-saver in the trimming of such goods, as the screw holes can be bored very quickly, the operator holds the hinge by one hand and the drill with the other, and soon becomes expert at it. The screw driver is almost equally as useful in this work, though it plays a more useful part when it comes to driving heavier screws, as the ordinary spiral quick return hand screw driver is very hard to beat when it comes to small screws.

The foregoing may suggest to some readers of the "Canadian Woodworker" how they might effect economies in some departments of their plants. The tools mentioned above are made by the Thor Electric Company, whose agents are the Garlock-Walker Machinery Limited, of Toronto.

Better Shipping Cases for Phonographs

At a meeting of the Canadian Phonograph Manufacturers' Association, held in Toronto recently, a number of complaints were made as to the quality of the shipping boxes the members of the trade were receiving. The suggestion was made that it might be a good idea to pool the buying of the Association members and purchase the shipping cases from one source. In that way the members would be in a position to demand a satisfactory box. No definite action was taken on this point.

Disposes of Interests

Major J. E. L. Streight of Islintgon, Ont., who recently sold his woodworking factory and lumber yard to the Irvin Lumber Co. of West Toronto, is widely known in the industry. He has had an interesting career in military circles and took part in the South African war, in which country he remained for some years after the close of hostilities. He returned to Canada in 1908 and started in the lumber business at Islington. When the world-war broke out in 1914, he promtply enlisted and commanded the first 250 men to leave Toronto, departing in charge of the contingent on August 14th, 1914. He took part in several engage-

Major J. E. L. Streight, Islington, Ont.

ments and was wounded and taken prisoner at St. Julien on April 24th, 1915. The Major was a prisoner of war for three years when he was exchanged and returned to Canada. He has spoken before a number of representative gatherings, outlining his experience and describing some of his thrilling attempts to escape, and the hardships and cruelties endured during the time that he was in the hands of the Germans. Arriving in Canada in August 1918, Major Streight re-opened his lumber yard on a new site with railway track facilities and also erected a planing mill, which is well equipped. Major Sreight will enjoy a rest for the present.

Expect Good Summer Trade

Chappell's Limited, of Sydney, N.S., who are widely-known lumbermen, woodworkers and builders, having sawmills at Sydney River and Oxford, N.S., say that the past year was the best they have had since they have been in business. The outlook for the present year is rather uncertain. They think that demand will be slow till after May 1st and that the year will close, showing a good average, at least during the last six months.

Continuing, the firm say "A decrease in wages of 20 per cent. has been put into effect in the Dominion Iron & Steel Co., and the smaller manufacturers are considering reduction of from 10 to 15 per cent. The housing situation is not ideal but is not as acute as it will be when business opens up in the spring.

"We understand the lumber output in Nova Scotia and New Brunswick is generally lighter than in past years, and we also notice that many lumbermen are offering to sell parts of their cuts at prices lower than those which prevailed last season, during which time many small operators held for the speculation, which is not now so much in evidence.

"In conclusion, we would say that the outlook for the next few months is only fair but the prospects are good for the balance of the year."

Size Not Deciding Factor

Small plants as well as large ones can be efficiently equipped and systematized. One small woodworking operation which consisted of but three machines, had a modern Yates high speed matcher, a Yates power feed rip saw and a Yates band saw. The line shaft which was about 40 feet long, was equipped with ball bearing hangers and the whole was driven by a 35 h.p. ball bearing motor. This is what might be termed an "efficient installation," for not only did the equipment consist of modern high production machines but the transmission was such that many dollars were saved in the monthly power bill.

Changes in Hardwood Inspectors

H. F. Holton, Toronto, was recently appointed inspector of the National Hardwood Lumber Association for Toronto and district. He has been with the association for more than a year and previous to that was engaged with Hart & McDonagh, whole-

H. F. Holton, New Inspector, Toronto district, N.H.L.A.

sale lumber merchants, Toronto. Mr. Holton was born and raised in Ontario. It is understood that J. E. Banks, late inspector of the N.H.L.A., has gone to Buffalo, where his home is and where he intends taking a position. H. H. Hastings will be Mr. Holton's assistant in the hardwood inspection work in the Ontario district.

Work as if you owned the place—and perhaps you may.

Never mind if competitors do tread on your heels as long as you keep them behind you.

Calculating Lumber Contents of Box

Uniform Method of Value to Industry—Money Lost Through Not Allowing for Waste—Rules Adopted by West Coast Box Men

By D. H. Stearns

The February "Canadian Woodworker" contained an interesting article, submitted by L. J. Conway of the Canada Box & Lumber Co., Quebec, outlining the method employed by his organization in figuring the feetage in boxes. This is a very timely topic—one that should have the attention of all box manufacturers. If some uniform system or method of figuring the lumber content of a box or set of shooks were adopted by the Canadian industry, it would tend for greater uniformity in quotations and would also eliminate the losses which occur in certain plants due to careless and totally inadequate methods of figuring feetage.

If, when figuring costs or preparing a quotation, a box man does not make due allowance for all cutting and manufacturing wastes which occur in converting the stock to the desired length, width and thickness, he stands a good chance of quoting too low; depending entirely on the amount of error in his calculations and the spread of profit he figured. There are more wastes than the actual loss due to trimming to the different lengths. Every time a piece is ripped or resawn a certain quantity of lumber goes into the sawdust pile. All possible losses must be figured out and allowed for, if accuracy in estimating is to be obtained.

Another advantage accruing from uniformity in calculating feetage, is that after certain standard methods have been worked out and adopted, it might be found that such figures may not be applicable to all plants. Some box men might not, for instance, be able to cut three ¼" pieces from 4/4 material or two pieces ½, S2S. from 5/4 stock. That should lead them to infer that their methods or equipment is not what it should be, and to successfully compete with their more up-to-date competitors, they will be compelled to improve their methods or equipment and thus the efficiency of the whole industry would be improved.

The following rules for figuring feetage were adopted by the box section of the West Coast Lumbermen's Association at a convention held in Seattle a short while ago and are presented in the hope that they will prove of interest and perhaps contain information which may be of value to the Canadian box industry:

Lengths

No fractions less than quarters to be figured. Where a dimension contains such fractions, use next quarter above.

Thickness—Rough and S1S

3/16 RS, 3 pieces from 4/4, center pc. resawn surf.
¼ Scant, 3 pieces from 4/4 R/S, center pc. resawn surf.

⅝ Rgh., 2 pieces from 6/4.
11/16 Rgh., 2 pieces from 6/4.
¾, 3/16 and ⅞ S1S of S2S, 1 pc. from 4/4.

Thickness—S2S

3/16 S2S, 2 pieces from 4/4.
¼ S2S, 2 pieces from 4/4.
5/16 S2S, 2 pieces from 4/4.
⅜ S2S, 2 pieces from 5/4.
7/16 S2S, 2 pieces from 5/4.
½ S2S, 2 pieces from 6/4.
5/6 S2S, 1 piece from 4/4.
11/16 S2S, 1 piece from 4/4.

Widths

¼ and ⅞ as 1".
1" to 1½" as 1½".
1⅝" to 1⅞" as 2".
2" to 2¾" as 3".
2⅞" to 3¾" as 4".
3⅞" to 4¾" as 5".
4⅞" to 5¾" as 6".
5⅞" to 7¾" as 8".
7⅞" to 9¾" as 10".
9⅞" to 11½" as 12".
11⅝" to 13½" as 14".
15⅝" to 15½" as 16".

In case of two or more pieces to a part, same rule to apply as one piece; i.e., the width of each piece of lumber used shall be figured as above.

One piece parts under six inches shall be figured to the next full inch above; except that, when the fraction shall be over ¾", the width then to be figured the next full inch.

On parts 6 inches to 11 ½ inches wide, the same rule to apply; except only even widths shall be figured, i.e., 8-inch, 10-inch, 12-inch.

On wider than 11½ inches. the same rule to apply; except the fractional dividing point shall be the ½ inch instead of ¾ inch.

To be figured as to length and thickness the same. as shook. As to width they shall be figured as follows:

Everything up to one inch in width shall be figured as one inch wide.

Anything over one inch and up to 1½ inches shall be figured as 1½ inches wide.

Anything over 1½ inches and up to two inches shall be figured as two inches wide.

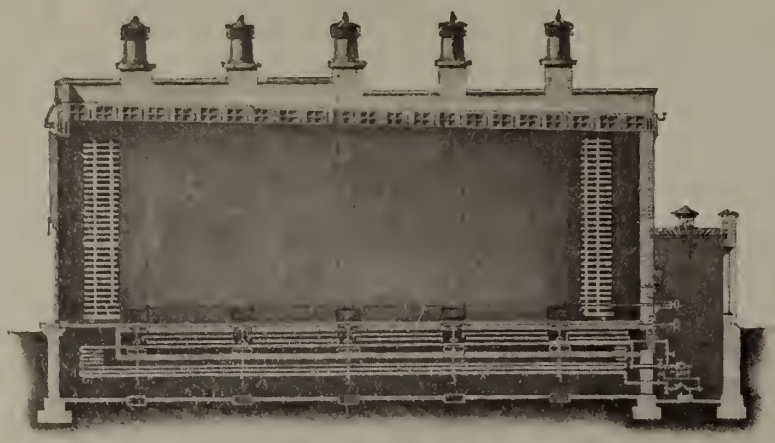
Anything over two inches wide to be figured the same as shook.

Weights

Usual run of shook, including resawn stock, 2,000 pounds per M feet. If cheap grade crate stock, or not thoroughly dried stock, 2,000 to 2.200 pounds.

Decimals

In figuring the total feetage of a box, the third decimal shall be dropped whenever it is less than 5/1000, and when it is 5/1000 or over it shall be called 1/1000 and added accordingly.



Thermo-Myst dry kiln as manufactured by Curtis, Hosey Dryer Co., Philadelphia, Pa.

Dry Kiln Co. Open Canadian Office

The Curtis Hosey Dryer Co., Philadelphia, Pa., manufacturers of the Thermo-Myst system of lumber drying, have recently made application at Ottawa for patents and trade make registration, and have also opened an office at 177-179 Duke Street, Montreal, P.Q., under the name of Curtis Hosey Company of Canada. They state they are now in a position to offer their Thermo-Myst lumber dryers to the Canadian trade.

The Thermo-Myst lumber dryer is a product which was placed on the market in the States about one year ago, and a number of successful installations have been made for wood working industries in the States. The Curtis Hosey Co. claim that this system of drying has numerous improvements, such as complete automatic temperature and humidity control, also a system of recirculation and a heating and humidifying system that insures even distribution of the heat and humidity in the lumber dryer, also that it produces uniform drying, eliminates warping, checking and honey-combing, and produces positive and rapid results as well as economy in the operation.

The Canadian branch will be in charge of R. MacLeay, managing engineer. Mr. MacLeay is well qualified to handle all problems relating to lumber drying, having had long experience in industrial engineering, and is an expert in heating and ventilating problems. He is a native of Canada, and the Curtis Hosey Dryer Co. of Canada take pleasure, in placing at the disposal of the Canadian woodworking trade, the facilities of their engineering service department which they maintain in connection with their Montreal office. They will be pleased to co-operate in solving any difficulties in drying problems with which the trade may have to contend.

Complete facilities have been planned for the manufacturing in Canada of all mechanical equipment that enters into the construction of the Thermo-Myst lumber dryer, with the exception of a few special parts, thereby saving their Canadian customers the expense of duties, freight and exchange that would accrue if this equipment had to be imported from the States.

A cutter that has got the "blues" soon turns its edge up, gets blunt, and requires a lot of attention.

How Moisture Affects Strength of Boxes

Of two boxes made exactly alike from the same grade and thickness of lumber, one may stand ten times as much rough handling as the other, because of a difference in the moisture content of the lumber or a difference in subsequent storage conditions. Tests made at the Forest Products Laboratory, Madison, Wisconsin, show that only when a box is to be used for a very short time immediately after manufacture is the proper seasoning of the lumber unimportant.

Within a week after manufacture a box made of green lumber suffers a marked reduction in strength. As the wood dries, the nails lose their grip. The fibers which are bent down along the nail shrink away from it in the direction of the end grain, the direction in which it was most firmly held, leaving the nail held only by two sides. Under such circumstances the weaving action during transportation alone will readily cause the nails to work loose and even come out of the box. Boxes made of green lumber at the laboratory and kept for a year in dry storage tested only about one-sixth as strong as similarly-made boxes tested at the time of manufacture.

If a box is made of dry wood and then subjected to alternate wettings and dryings, through cold storage or exposure to weather, the nails will be loosened just the same as in green lumber. Boxes made up from dry lumber were kept for two weeks in damp storage and then for two weeks in dry storage. After this treatment the boxes withstood only one tenth as much round handling as those made of air-dry lumber which had not been subjected to adverse storage conditions.

A box of lumber in the proper moisture condition will stand ordinary storage without any appreciable loss in the holding power of the nails. The best results are, therefore, obtained when the lumber is seasoned in accordance with the atmospheric conditions which the box will encounter in service. If it is impossible to forecast these conditions, it is advisable to use thoroughly air-dry lumber, which contains from 12 to 15 per cent moisture.

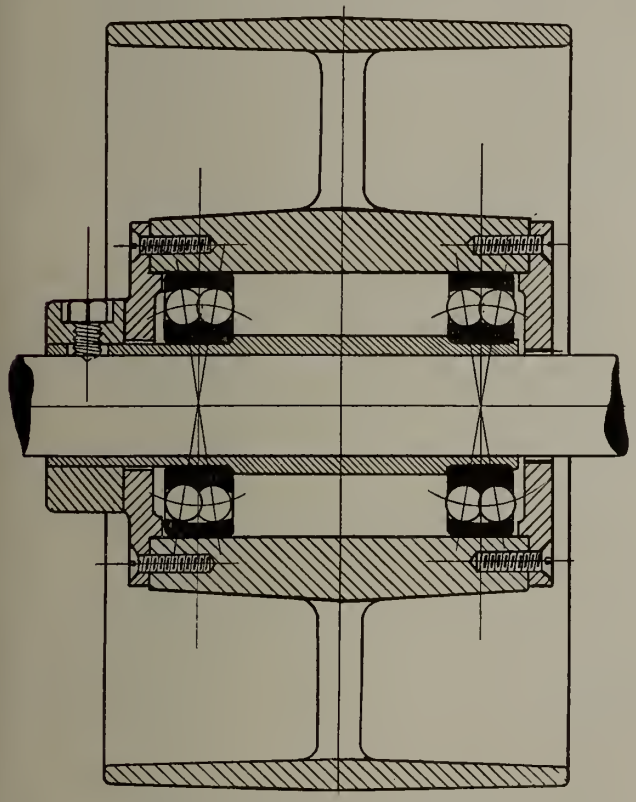
Accidents are the fault of some. Don't let the fault be yours.

You increase the chance of breaking emery wheel by running it too fast.

Machinery & Equipment

Ball-bearing Loose Pulleys

One of the newer developments of the application of ball-bearings to loose pulleys is shown in the accompanying sketch. The radial bearings are mounted on a steel sleeve, which is held to the shaft by a set collar and which is used to locate the pulley in position on the shaft. This design, which is simple in construction, gives a very large chamber between the bearings for the lubricant, with the result that one filling should, under ordinary conditions, last for one or two years. The end covers keep out the dirt and prevent the escape of the lubricant. With this type of loose pulley, the centrifugal action of the pulley carries the grease or oil to the inside of the hub where it is required rather than away from the bearing,

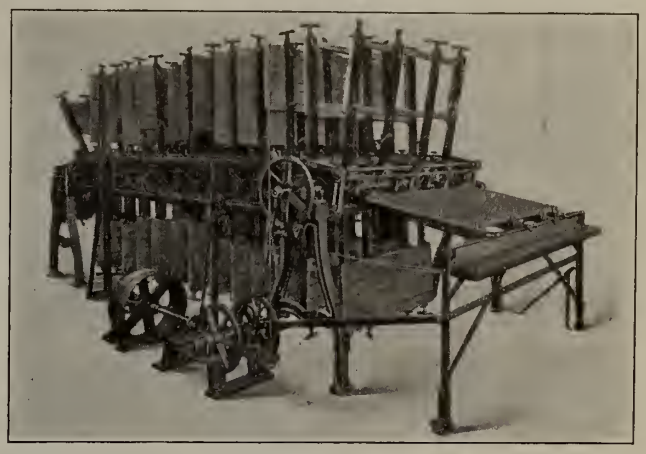


Ballbearing application for loose pulleys.

which is the case in the ordinary type of pulley with plain bearing. Owing to the high speed at which the loose pulleys on woodworking equipment are usually run, an application of this type is particularly advantageous. For further particulars write to the Canadian S. K. F. Co., Limited, 83 King St. West, Toronto.

Billstrom Clamp Carrier

There are many types of clamp carriers on the market. The one herewith illustrated is the well-known Billstrom clamp manufactured by N. J. Billstrom, Rockford, Ill. This clamp is made in two sizes with either 29 or 39 sections. The clamps are adjustable for stock up to 6 feet, 6 inches in length and 30 inches wide. Special sizes having a larger capacity are made to order. This machine requires a floor space 19 feet long and 9 feet wide for the smaller machine and 24 feet for the 39 section size. It is



Space and labor saving clamp carrier.

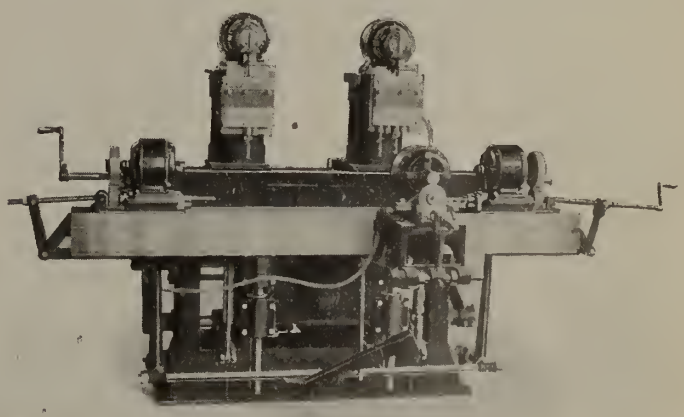
power-driven and can be belted from almost any direction. The movement of the carriers is controlled by the operator by levers which are placed within easy reach. With this type of clamp the adjustable clamp is pulled toward the stationery head which tends to prevent the stock from buckling.

Clamp carriers are being used by many woodworkers to cut their glue-room costs. Circulars and full particulars on application to Nels J. Billstrom, 202 9th St., Rockford, Ill.

Four-way Boring Machine

This machine, from the shop of the Dauber-Bell Machine Co., Oshkosh, Wis., is adapted for boring in one, two, three, or four directions at once. It is entirely motor-driven, there being a motor for each bit-carriage and one for the table-lift.

The work-table at the front of machine is power-



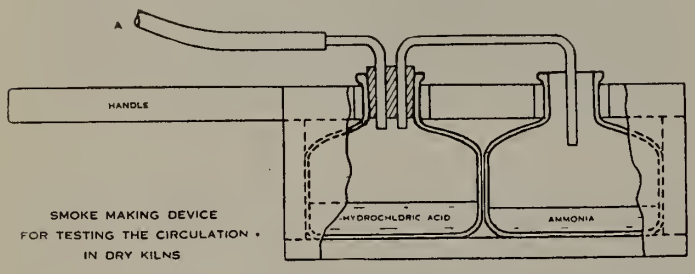
Dauber-Bell four way boring machine.

driven, and, as it rises and falls, the end carriages and side carriages are moved in and out of the work automatically. As the table rises the work rises with it, and can be bored in both ends and two sides at once. Bit-carriages are all adjustable to bore various depths and for work of various lengths. Bits are ordinarily furnished on 1-in. centers, but can be furnished on various centres, to suit requirements. Further particulars may be had on application to the manufacturers.

Testing the Circulation in Kilns

Watching smoke travel through the piles of lumber is the best method of testing the circulation in a dry kiln. The smoke may be made by burning punk-sticks, tobacco, or rope. Some fire risk, however, attends the use of any of these. Furthermore, the smoke has a temperature higher than that of the air in the kiln and tends to rise of its own accord before following the air currents.

A device which produces a fireless chemical smoke is used for testing circulation in the kilns at the Forest Products Laboratory, Madison, Wisconsin. This device is easily made by anyone and requires only the



Device for making cold chemical smoke.

following materials: some short, thin pieces of board; 2 small, wide-mouthed bottles,—ink will do; 3 feet of 3/16 inch rubber tubing; 6 inches of ⅛-inch glass tubing; a two-hole rubber stopper to fit one of the bottles; some concentrated ammonium hydroxide and some hydrochloric acid. The accompanying sketch suggests how the apparatus may be constructed.

To use the apparatus, pour a small amount of the chemicals into the bottles as shown. Blowing through the tube A will cause a dense white smoke to issue from the bottle containing ammonia. This device may be carried into a kiln without danger of fire, and the smoke will be found to follow air currents without any tendency of its own to rise or fall.

Lathe for Turning Spars

One of the largest woodworking lathes ever produced is shown herewith. This machine was made by the Oliver Machinery Co. of Grand Rapids, Mich., for the U. S. Government. It is to be used for turning spars or ships' masts. The bed is 62 ft. long and the heads have a swing of 32 in. It is equipped with two power-feeding carriages, together with a number of steady rests for supporting the long spars while they are being turned. An idea of the length of this lathe may be gained from the fact that it is equal to 44 men standing side by side. Only two manufacturers of woodworking equipment bid on this piece of equipment, the contract going to the above firm.

Living-room Table Manufacturers Meet

The first annual meeting of the Association of Living Room Table Manufacturers was held in the Auditorium Hotel, Chicago, on March 3rd. A very representative gathering was present. The growth made by this infant organization during the first year has been very gratifying. A survey made among the members in attendance disclosed the fact that the average production in the plants represented was from 30 to 40 per cent. of normal, with from 15 to 40 per cent. of the average number of employees working. Costs came in for a considerable amount of discussion, and it was the consensus of opinion of those present that no further reductions in prices could be made for the present at least. Emphasis was laid on the high proportion of overhead which exists when production is curtailed and the different manufacturers were advised to give particular attention to this point in order to avoid establishing too low a level of values and to prevent financial disaster. A resolution was passed, agreeing to contribute toward the National Advertising Fund of the National Furniture Council.

Cedar Lined Chests in Period Designs

One of the newer developments in the manufacture of cedar chests is to use some of the better-known cabinet woods, such as walnut, oak, mahogany, etc., on the outside and lining the box with Tennessee aromatic red cedar. Several lines made in this way were displayed at the furniture exhibitions in Grand Rapids and Chicago. These were made in the different period designs to match the various styles in bedroom suites. Chests of this construction should have a very strong appeal to many buyers and should result in an increased demand for cedar boxes. A person who would hesitate to place the ordinary type of cedar chest in a bedroom furnished in walnut or oak, owing to the clash in colors, should welcome a cedar-lined box in a wood and style to match the rest of their bedroom furniture.

System should be the slave, not the driver of your business.

You will never have what you like until you learn to like what you have.

Read your trade paper, including the advertisements—there may be hidden gold therein.

Those who never do any more than they get paid for, never get paid for any more than they do.

Upholstering and Trimming

Securing Co-operation of Workmen

Secretary National Association of Upholstered Furniture Manufacturers Outlines Issues on Labor Question

By D. D. Fennell

(Concluded from February issue)

We are a wasteful people, we American people. All of mankind has been wasteful, but we, with our prodigality of resources, are especially so. To-day we take coal from the West Virginia fields, bring it up to Grand Rapids and use 20 per cent. of it. The by-products are worth 80 per cent. of the coal. What you get out of it is worth 20 per cent. The Germans have used all of the so-called by-products. Coal tar derivatives, such as aniline dyes, benzol, various medicines become soot from our chimneys to soil the landscape. Some means must be found, and soon, in America, whereby we shall convert the coal into a gas or electrical energy near the mines and distribute it over the country economically. What is true of the handling of our coal is also true of our industrial management methods. We use, as Professor James has put it, 15 per cent. of man's potential power.

I had an experience in Philadelphia, which will concretely illustrate what I mean. I was going through a plant making an analysis. The plant was given over to the making of flax rovings. The president was walking through the plant with me, and at our heels ran a little lad who was constantly getting in the way. Finally the presideant turned to the superintendent and said: "Get that boy out of here; I can't stand him around any longer." The little fellow, humiliated and apparently anxious to tell us something, began to cry. I said, "This lad has something under his hat that he wants to tell us." The president called him over, and he told us his story. He was an orphan sent over here from England. He went into this plant, working for the mere pittance of $10 per week, or something like that. Already his mind was going through that plant. He was a natural born analytical engineer. He said, "I have been trying to tell that 'cove' over there (meaning the superintendent) for a long time that he was wasting too many people in heckling his flax." The custom was to have a great number of girls take hanks of flax and sitting before the combs where the line was separated from the tow, place a single hank in the frame and remain idle until it was finished. He said, "If you will build a rectangular frame and put a trolley on it, you can put eighteen combs on a frame of a certain size, that will heckle eighteen hanks of flax at a time. One girl can sit at a given point, put one hank on with the left hand and get the other off with the right, and you can get your product heckled so much more quickly and you will only need one girl in place of eighteen. That machine was put in within two weeks and it meant a saving of thousands of dollars to that plant annually. We must recognize, gentlemen, that there is potentially, by-products and great reservoirs of possibilities in our employees that we must find a way to get out, and that is up to your own genius and your own studiousness to work out. Just as we are wasting coal to-day, we are wasting man-power, because we do not recognize that man is a mental animal primarily who insists on his right to express himself.

Give Workman New Idea

The shop committee, where properly installed and properly operated, has developed numbers of men, making them of much greater value to themselves and to their employers. Where it has failed management has been to blame usually. Means should be exercised to utilize all of the man-power we have, and make "professional" men out of our workers. What is the difference between a professional man and an ordinary journeyman worker? A professional man utilizes every bit of his ability. He gives all of his time, all of his research effort and everything he possesses to his profession. He works day and night to get out of it all that there is in it. He loves his profession,and he is absorbed in it. He spends days and nights during his college career studying every phase of his "major," because it is the one big thing in his life. That is the difference between the journeyman worker and the professional man. Help your journeyman worker to see all there is in his job for him and help him to take a professional pride in his work, giving him a chance to register his mental conceptions through some vehicle of industrial democracy and you will have tapped the well-springs of possibilities in men, such as you never knew they possessed.

Self-respect: Gentlemen, if you want to start trouble in your plant, if you want to vitiate your power of leadership, tamper with the instinct of self-respect in a human being. When you hurt the sense of dignity in any man living under the broad privilges and possibilities of the American Declaration of Independence and the American Constitution, you are treading on mighty dangerous ground. I have known men to lie on me, but I never called an employee a liar in my life. I always conspired to let him know that I knew he had lied, if he had, but I always "saved his face." I never have said, "Well, now, I've found you out and I'm through with you." I let him know I knew all about it and endeavored to show him the better way without "breaking" the man.

Some parents in bringing up their children, tell them frequently what bad children they are; scare them by telling them that lions, tigers and all sorts of wild beasts will get them if they don't behave and register in their pliants minds many other negative suggestions which are lasting and harmful. I would not tell a child of mine that he was a bad child. (I haven't any children of my own, so I can talk this way), but if he was a bad child, I would say, "Why, a good child like you should not do a thing like that." The positive suggestion if you please, the opening up of hopes and possibilities and the putting of facts squarely on the table so that a man can see his own errors is the best thing.

Never destroy the self-respect of a worker. If you

haven't a sense of humor, live with an Irishman for a while until you get it, and it will help you through many of the most difficult experiences you have to face in industry.

Instill Loyalty and Reap Co-operation

Loyalty: This instinct is gregarious, it has to do with the herd. Those horses I told you about had just one thought. They were in a circle with their heels out, and God help the wolf or other miscreant that would attack them in that formation.

Where there is lack of loyalty you will find the "I" is predominant. Loyalty is generated by confidence. You can make time studies in any plant when you say "'We' are going to do this or that." You can put in scientific management in any plant when you say "We," but you cannot when you say "I." Loyalty and "We" are almost synonymous in their effect upon men in general. I have here in the magazine called "Law and Labor" a report of a plan that has worked out successfully in Philadelphia:

"The Philadelphia Rapid Transit Co. has been operating its street railway properties on a basic five-cent fare notwithstanding the great increase in the cost of maintenance, materials, etc., since the beginning of the war. It recently became apparent that the five-cent rate was not producing revenue enough to operate on a paying basis and certain members on the board of directors of the company advocated increasing the fares to seven cents. Mr. Thomas E. Mitten, president of the company, whose announced policy is to give the best possible service at the lowest rate, contended that if the Public Service commission granted certain restrictions in the transfer system throughout the city, which had been asked for but had not been acted upon by the commission, satisfactory service could be maintained on the five-cent fare, the stockholders would receive dividends at the established 5% rate, and the increase in wages promised to the workers could be made. This situation caused a crisis in the company's affairs, and Mr. Mitten called a meeting of the elected representatives of the company in conducting the system for the past nine years, for the purpose of explaining to them the precarious financial condition of the company. A meeting was called on July 23rd, last, and after the matter had been explained the 250 men representing the 11,000 employes of the company voted unanimously to help the management in its fight for a basic five-cent fare by waiving their right to certain wage increases which the company had bound itself to pay, and to continue the present wage scale until such time as the finances of the company would permit of its granting the increases agreed upon.

Attitude of Employes

The action on the part of the representatives was followed by a referendum vote of the rank and file of the workers and so efficiently did the machinery of the employes' organization work that at the end of three hours a complete vote was recorded and every branch of the employes' co-operative organization unanimously voted to sustain their representatives. As a further expression of confidence the employes offered to loan, without interest, their savings amounting to about $1,000,000 in the treasury of their Co-operative Welfare association, and to place at the disposal of the company on the same basis their future savings which will amount to more than $1,000,000 annually for the purpose of helping the company to weather the present financial storm.

It was said by an official of the company that this was the first time in the history of street railway operations in American where so large a body of men have voluntarily agreed to forego an increase in wages, and that it marks a new departure in the relations between capital and labor. Mr. Mitten, in expressing his appreciation of the offer and commending the men for their co-operative spirit, said:

"Co-operative effort whereby men and management work to a mutual purpose has again been given a new meaning. The men in this temporary emergency, have by their action shown their confidence in and their determination to sustain the Mitten management, whose declared policy is to give the public the best possible service at the lowest rate of fare; to pay its employes the highest wages, equal to the average of other like cities; and to protect properly the P. R. T. stockholders' equities in the property."

Thus was such loyalty built up as it will be difficult to destroy. It was built on the "We" plan.

Personality in Management

Until the end of time the personality of the management will have much to do with the success or failure of any enterprise. Gentlemen, I want to tell you that one of the fundamental needs of industry on the part of the employers today is to learn how to smile. It goes further than an hour of argument and further, sometimes, than a five or ten per cent increase in wages. Accompanying your "We" with a smile. The personality of some of our managers in industry today is reprehensible.

A comprehensive shop committee plan was put into three plants and it was a failure from the day it was put in because of the unpolitic methods of the management. In one plant the man who met the committee set himself up as a god in judgment and said at the initial committee meeting, "Well, what do you fellows want? Bring on your propositions and we'll consider them." Then he banged his fist down on the table and looked out from under his shaggy brows as though he hated every man in his presence and you can imagine how far a scheme of that character would go under such conditions.

I want to say to you gentlemen, who are interested in the open shop that any conception of an open shop as a means of reducing wages beyond the reasonable market rate is a stimulus to union argument. Any open shop movement that is for the purpose of cutting a wage and giving a man less than he can earn under the usual union wage and union arrangement had better die aborning. Couple a reasonably high wage rate with a good production system and your labor will cost the minimum amount.

Pay More Rather Than Less

In the city of Chicago among upholsterers, in forty plants we have increased the wage rate thirty-three and one-third per cent. beyond the demands the union made upon us. Just now, when business is a little slack and when we are doing a lot of thinking, let us think constructively and let us do the sort of thinking that will accomplish results, gentlemen. Put the means of establishing industrial stability into your plants today, because if you do so now, when business is quiet, your men will know that you are sincere in your desire to effect right employment relations.

Within a twelve month, industry will again be active in all trades. For this resumption of activity, organized labor is well prepared to fight to the limit

of its strength, the open shop. Gentlemen, there cannot be a semblance of industrial stability under union domination, so we must open our shops and keep them open as a part of our general educational program.

If you read Samuel Crowder's article in the "World's Work on "Who Owns the United States," you will see a remarkable statement. He says in effect that the monopolistic tendencies characteristic in the days of Cornelius Vanderbilt have now been transferred from the buccaneers in capital to the buccaneers in labor, and if Cornelius would come back today he would find himself right at home in the office of the Plumb plan.

"Power takes its morality from the results of its use. If the power of trades unionism means that a man cannot work without the approval of a union, no matter what its motto for the future, no matter what its record for the past, no matter who its champions, trade unionism cannot survive in the United States."

There is no royal road to learning, gentlemen, and there is no royal road to the accomplishment of immediate industrial stability. All we can do is to guide our men aright and try to get all of the potential possibilities that are to be found in human nature out of them for their own sakes, for our sakes and for the good of posterity.

What is needed just now, is clear thinking minds, warm, just hearts, feet squarely upon the ground but when moving, moving always progressively, an optimism such as has carried America over her most difficult and strategic periods, and faces ever turned toward the sushine that the shadows may fall behind.

Standardization as a Trade Economy

Standardization is as much a trade problem as a plant problem. The individual manufacturer who endeavors to develop standardization in his plant will find himself unable to proceed very far without cooperation of some kind from the other elements of his trade. Moreover any appreciable progress in standardization by important units in trade fails to have effect upon the trade as a whole.

Being a trade as well as a plant problem any individual concern interested in obtaining the greatest possibilities of standardization among individual plants should realize the necessity of creating an active interest in standardization throughout the trade. The national trade association offers a most promising means of realizing the benefits of standardization in its fullest sense. Standardization as a trade activity has already been attempted by the following industries: Case, Musical Instruments, Boxes, Tire and Cars, Rubber Goods, Metal Lath, Cooperage, Bicycles, Clothing, Lumber, Paint, Shoes, Petroleum, and Pumps, Meat Packers, Automobile and Accessories, Railway Equipment.

There are seven especially important trade economies to be obtained by standardization. 1—Decreasing capital investment in all branches of the trade, and in individual plants. 2—Elimination of waste in experimentation and designing. 3—More speedy and reliable deliveries. 4—General decrease in prices. 5—The introduction of new prices, and machinery facilitated and made possible, 6—Elimination of false and wasteful ideas prevalent in the trade—relative especially to designing, quality and methods. 7—Decrease of ruinous competition, due to ignorance.—A. L. Smith, U. S. Chamber of Commerce.

Polychrome Finish in Popular Favor

Attractive on Small Articles Such as Table and Floor Lamps, Book Ends, Wall Mirror Frames and Tables— Pleasing Effect Secured

Of late, polychrome has become one of the most popular finishes upon the market, and this is deservedly so because of its real beauty. Turning to nature, in the fall one may find a vision of polychrome spread upon the rising hills, where the magic hands of the Frost King have painted innumerable soft and lovely colors upon the leaves. Contemplating such a picture from a little distance one sees only a blending of shades, there are no harsh colors to be seen, and such is the ideal that the finisher producing polychrome must strive for. Harsh, bright colors have no place in polychrome. Soft, subdued colors must be employed—those that naturally blend with one another.

The methods of carrying out this finish are as diversified as the colors employed. It is doubtful whether there are two houses that use the same method. It is also doubtful whether any house has succeeded in turning out two pieces of polychrome that are exactly alike; therefore, the finisher must realize in the beginning that this paper can give merely the basic information, or skeleton, as it were. He will have to adapt this to his own requirements, or, in other words, build up the rest of the body to suit himself. He will, however, be enabled to proceed with a reasonable degree of intelligence, and after a little practice, will be able to turn out a first-class job.

For Irregular and Ornamented Surfaces

Before proceeding further, the finisher must bear in mind the fact that it is impossible to polychrome a plain piece of wood, that is, one that has a perfectly plain surface. The furniture or other work must be ornamented with turnings and carvings in order to properly present this finish, as this gives an opportunity for design and dusty backgrounds. The fluted columns of the ancients with their many elaborate carvings were often painted in various colors, which the centuries of storms and sunshine have dimmed until they are visible to us today only through what appears to be a dusty film. Such is the origin of polychrome, and it is from the past that our designers have conceived this finish as we know it today. It will be seen, therefore, that any piece which abounds in turnings, carvings, or flutings, is ideal for this work.

Roughly speaking, polychrome may be produced in three ways: First, the stippled finish, second, using a colored enamel over the entire piece, and third, staining the piece much as in the production of the ordinary finish. The first of these methods is distinct from the other two in the preparation of the wood. This method, as its name implies, gives a stippled finish, and is very suitable for small pieces, such as table lamps, book ends, candlesticks, etc. The second method is suitable for small pieces and also for those of moderate dimensions. The third method is suitable for the largest pieces. Of course, no hard and fast rule can be laid down as to which method should be employed for any article of furniture. Ofttimes the three methods will be employed in the finishing of a single piece.

For example, take a table. The top would be finished by the third method, with a stippled border around the top, which would employ the first, and the second method might be used for finishing the legs. Then, too, a lamp base might be finished by the second method with stippled sections around the base or other portions.

With the first method, the work is given a coating of wood lacquer or shellac, which is reduced with a suitable solvent so as to form merely a wash coat. A coat of special stippling material which is now upon the market, is then applied. This coat must be plastic and will require very little thinning with turpentine. Before this stippling material dries, it is stippled. This may be done in a number of ways, but is usually accomplished by means of a stiff-haired brush. The brush is held at right angles to the work, and the operator then taps it gently over the stipple, thus drawing it up into fine points, and it is then allowed to dry in this form. Twenty-four hours is usually sufficient for drying under ordinary conditions. If the stipple is thick enough, it will draw up into long thin points. If these are not desired, a thinner mixture will allow the points to flatten out. We now have a rough surface on top of which any desired color may be applied. For example, let us take a candlestick, with turnings at the top, a fluted column, and a carved base. A coat of redwood lacquer enamel (or any other color) is next applied, and when this is dry, a thin coating of pale gold bronze should be sprayed on. Wood lacquer is by far the best material to use for this purpose. The lacquer should be reduced with a special lacquer thinner, 50 per cent, and then from one to one and one-half ounces of pale lemon yellow, bronze lining powder stirred into each pint of it. A deeper color, such as roman gold, may also be used, of course, if that is the effect desired. This mixture is then lightly sprayed on the work. The carvings on the base, and the flutings on the column, should be polychromed in harmonizing colors, or, in other words, a design in appropriate colors is painted upon the work. When this is dry, re-spray very lightly with a thin solution of bronze powder. Now prepare a very thick paste of turpentine and rotten stone, and smear this over the entire piece. Wipe this off before it dries, using a soft cloth. You will readily see that this rotten stone will cling in every little pore or crevice, when the turpentine has evaporated will give the work that old dusty look as though it had withstood the elements for centuries.

In the second method the work is first coated with a colored wood lacquer enamel. While ordinary

artist's oil colors may be employed, we can not recommend too strongly the use of wood lacquer enamel. The wood lacquer enamels not only wear very much better than the oil plants, but they also have the advantage of being waterproof, and they dry in a very much shorter period of time. While oil colors will require about twenty-four hours to dry, lacquer enamels are dry in a few hours. This point alone makes the employment of lacquer enamels very desirable, as any manufacturer will readily appreciate. To return to our method, the piece is first coated with a colored enamel. If the same color is desired to predominate over the whole piece, the work will then be given a first coater of only one color. If on a large piece, different colors of course may be employed. For example, a lamp standard might be given a coat of red lacquer enamel on top, green on the column and blue on the base. After this is dry, the work is then sprayed with a thin coating of pale bronze, as in method No. 1. The design is now to be painted upon the stand, and right here is the stumbling block of many a finisher endeavoring to produce polychrome. While it does not take an artist by any means to accomplish satisfactory results, yet the finisher must have a little artistic ability in the application of his design. As stated in the beginning of this article, bright colors must never be employed. Faded, washed-out colors are the rule. These may be obtained by suitable mixing, thin solutions, and light application. When the design is thoroughly dry, another coating of the light bronze is applied. In this case, however, the air pressure should be reduced, and the brush held quite a way from the work so that a very light coating is applied.

Next comes the coating of turpentine and rotten stone, which is smeared over the entire piece and then wiped off as before. In applying the design, ordinary artist's camel hair brushes can be used. It is perhaps unnecessary to state that in using the liquid bronze in the spray gun, some sort of an agitator should be used, as the bronze powder will settle to the bottom of the container. Most air brushes are built with this device. If it is not used, the cup containing the bronze liquid must be thoroughly stirred up at intervals. It is also well to point out at this time that, when we speak of fine bronze powders, we mean "lining powders," such as are used for the very highest grade of work, such as lining or striping automobile bodies, etc. These lining powders are extremely fine and impalpable, and are not to be confused with the ordinary coarse bronze powders generally found upon the market. Lining powders being very fine, will stay in solution for two or three hours, while a coarse powder will begin to settle almost immediately.

A Light Pore Effect

The third method is usually more or less a combination of the other two. The entire piece is first stained in the usual manner. A wash coat of wood lacquer is then applied, reduced from 60 to 75 per cent, with special wood lacquer thinner. This is then sprayed on the wood, and when dry, the wood should be lightly sanded. A thin coating of zinc or white lead is then applied. This may be obtained by rubbing up a little of the dry pigment in turpentine and adding a little japan, or zinc white ground in oil, may be used in the same manner. Zinc white ground in japan is better yet, as it has been demonstrated that this will cling better in the pores of the wood. This thin paste is then applied the same as a paste filler, only, of course, it is not supposed to fill the pore, but merely to color it gray. Where gum wood is to be finished, coarse aluminum powder will be found superior to either that or zinc. It will give a very soft effect, which is very pleasing and desirable. Note that for the aluminum powder we specify a coarse grade. A fine powder would cling too much to the work, and give it a metallic sheen which would be very undesirable and difficult to remove. After this filler is thoroughly dry, a coat of wood lacquer is sprayed on. In this case the lacquer should be reduced about 40 per cent with special wood lacquer thinner. When this is dry, it may be waxed or finished with a mixture of turpentine or rotten stone. The border around the top of the table may then be finished with the stippled effect and the legs with their turnings and carvings may be finished by using the second method. Designs are sometimes employed by means of Decalcomania transfers, or where expense is not objectionable, they are painted on by hand. These designs are, of course, only employed on large pieces, as for example, the center or at the four corners of the table top. Drawer fronts are sometimes ornamented in like manner.—"Furniture Manufacturer and Artisan."

Molds and Wood Destroyers

Not all fungi which live upon wood impair its strength, but conditions which promote the growth of molds, blue-stain fungus, and other non-injurious fungi are usually favorable to the growth of the wood destroyers, and these may be active on the same wood bearing the molds. Hence, the presence of mold on timbers intended for any structural purpose should cause them to be looked on with suspicion.

In the early stages of their growth the molds and the wood-destroying fungi sometimes have a very similar appearance, and there is no simple means known to the U.S. Forest Products Laboratory by which lumbermen and wood users can separate them at sight. The surface growth of molds is generally cottony or felty in appearance, the mycelium or fine mold threads are interwoven, never compacted into membranous sheets or strands. The mycelium of wood destroyers may be fluffy and glistening, but more usually are compacted into strands or fan-shaped patches.

The characteristic feature of mold growth on wood is the fact that the minute threads which enter the wood do not bore into the wood fibres or dissolve them away. They pass through the spaces between the fibres or enter them through the natural openings, called pits, which are found in the walls of certain cells. Starches, sugars, and other contents of wood cells constitute the food of the molds.

The wood destroying fungi are able to send their threads right through the wood fibres, breaking down the cell walls and utilizing portions of this decomposed material as food. This action very markedly weakens the wood, making it crumbly, stringy, or spongy,—in other words, producing rot or decay. The presence of wood destroying fungi in an advanced stage of growth is evidenced by fruiting bodies, commonly called mushrooms, toadstools, or conchs.

The principal economic loss caused by molds is through the staining or discoloration of the wood. No great injury may be caused by the wood destroyers in their early stages; but their work will continue and finally result in the destruction of the wood.

The Drying of Varnish in Special Kilns

Output of Finishing Department Increased by Speeding Up Drying of Varnish—Taking Advantage of Natural Movement of Air—Uniform Conditions Essential

By C. A. Cutler*

In another article, the manner in which varnishes harden and the effect of heat in this process, was explained. It was assumed that the simplest manner of applying heat to the freshly coated surface was to place the piece in a specially constructed heated room, in other words in a kiln. The requirements, to obtain the best results, were an even and controlled temperature, rapid circulation and very efficient ventilation. Except in a specially constructed room these conditions would be very difficult to maintain.

If heat effects the speed of drying then it follows that to dry evenly the temperature must be applied evenly. The mere installation of sufficient heating surface to raise the temperature of a given sized room to a given temperature would result in a difference of temperature at the ceiling and at the floor level that would cause widely different drying times. These articles placed near the ceiling would be dry sooner than those near the floor. The difference in temperature between the floor and the top of the kiln is largely determined by the height of the room, but as a matter of economy of floor space and construction expense it is usual to build kilns as high as it is practical to pile the goods that are to be placed in the kiln. This height in most cases would be eight feet or over which is quite sufficient to cause ten to twelve degrees difference of temperature between floor and ceiling. A difference as great as this would make a great difference in the drying time. An automobile body standing on its "nose" in a condition like this would be hard enough on the upper end to rub when the "nose" was still far from dry. To save all the time possible, all the material in the kiln must be treated to the best possible drying conditions. If it is determined that a certain temperature is best, then that temperature should be maintained in all parts of the kiln.

Circulation and Temperature

A heating surface gives off heat in two ways. One is by heating the air surrounding and in contact with the heater which results in expanding this air until it is light enough to rise above the color air at the level of the heater. The other is direct radiation, called radiant heat. In the first case, the air rises to the ceiling and remains there until cooled to a temperature less than that of the air rising from the heater. Then it begins to descend to a lower level and gradually finds its way to the floor where it remains until re-heated. This is called a gravity circulation because it is dependent entirely on the difference in weight of air at different temperatures. A circulation of this sort is very slow unless there is a great difference of temperature caused by radiation through the kiln walls or because of ventilation. Heat costs money and, therefore, it is very desirable that the kiln walls do not radiate heat more than necessary and that the ventilating system be of a type that will remove as little heat as possible and still keep the air fresh.

Radiant heat is that heat that travels in straight lines in all directions from the heater. It is the same kind of heat that one feels on their cheek when sitting at a window in a train as it passes a fire alongside of the track. This kind of heat is like light. It will pass through transparent material, like glass. It will reflect from a smooth bright surface in the same way as light and it will be absorbed by a dull dark surface just as light would be. Radiant heat will raise the temperature of the surfaces in direct line with the heaters but will not heat the surfaces not in direct line. Therefore, radiant heat is another cause for uneven heating and should be eliminated as much as possible. This will explain why some kilns dry better in one part than another even though a thermometer protected from radiant heat shows the temperature to be the same in all parts of the kiln.

Providing for Even Circulation

The coolest air in the kiln will be at the floor level and inasmuch as this is the air that must be brought up to the desired temperature, the heaters should be on the floor line or some means provided to bring the floor level air to the heater. In lumber kilns there is usually a space under the lumber where the cooler air is collected for reheating. This same sort of "pit" should be provided in a varnish kiln. It is best done by piling the materials in the kilns so that there is a free space between them and the floor. This allows the colder air on the floor to flow direct to the heater instead of having to find its way in and out around the various piles.

The disadvantages of uneven heating have been shown. The simple remedy is the increase of circulation of the air so that it will return to the heater before it has had time to lose enough of its heat to effect the drying time. If the movement of the air in a kiln is going to be dependent entirely on natural gravity circulation, its speed will be directly in proportion to the difference in temperature except for such speed as can be gained by making its path as straight and short as possible. So if the circulation is to be increased without difference in temperature some mechanical means must be used. Fans and blowers, if properly designed or installed, will increase the speed of circulation and maintain an even temperature in all parts of the kiln.

Follow Natural Lines of Movement

The circulation, even though assisted by blowers, should always be in the path or direction of a natural gravity circulation. If a circulation was set up in an opposite direction it would have to be powerful enough to overcome the natural circulation which would be a waste of power, but the big difficulty would be the uneven distribution of the air currents. It is just as necessary to have the circulation even as it is to have the heat even, as one depends upon the other. The most even heat and circulation is had when the heated and conditioned air does its work on its way downward instead of upward. The object of heating the air is to furnish heat or energy to the varnish sur-

*President Cutler Desk Co., Buffalo, Manufacturers Cutler Dry Kilns.

face. To do its work it must give up some of its heat but in doing so it becomes cooler and, therefore, less able to further perform its function of heating as well as giving up oxygen and absorbing fumes. The sooner the air can be reconditioned the more work it will do. If it is heated and allowed to rise up through the materials it starts work immediately. That is, it will get cooler, take on fumes and give off oxygen until it reaches a state of balance, or a layer of air that is of the same temperature as itself. Then it will continue to give off heat, although not in motion until it becomes cool enough to fall, then it wants to go back in the same path it came up. In its downward trip it meets the upcoming air and thus slows up the air movement, both up and down. The air that has done its work is kept in contact with the surfaces longer than it should be and the fresh conditioned air is kept from contact longer than would be the case if the motion was all in one direction. Again, in order to keep a given temperature in all parts of the kiln, the air rising from the heater up through the materials must be somewhat hotter than the desired temperature in order to provide for the heat radiated through the walls and the heat needed to bring the material up to the required temperature. If the kiln temperature is to be attained in a reasonably short time, the temperature of the rising air would often be much greater than desirable so far as the material is concerned.

(Continued in April issue)

That Valuable Suggestion Box

The suggestion box often brings forth ideas and suggestions that can be used to increase production, reduce costs and improve conditions and methods in the plant. Have you made use of this valuable aid? Offer a weekly or monthly prize of a few dollers or pay, according to their value, for all ideas which are found to be practical, and see what results are forthcoming. One manufacturer in calling the attention of the employees to the suggestion boxes which were being placed in the plant says in part:

You can't help seeing how things could be done even a little better in your own department. You know about details that cannot come to the attention of the firm unless you call attention to them. Details about improving or increasing our output. Let me outline a few things that may indicate what kind of suggestions we want:

1. What should be done to eliminate waste, both in labor and material?
2. How can we increase production?
3. What is your idea about handling our work?
4. Do you lose time in waiting for materials? If so, what is the cause; how could the condition be improved?
5. Are our machines and tools in proper order and of the right kind?
6. Are the materials we use of the right kind, or do you know of a better quality at less money that would serve our purpose?
7. How can we make and pack our goods better than at present?
8. Can you suggest a better way of laying out departments?
10. Are all of our operations standardized — any surplus motions? Can you suggest a way to get more out of your machine with the same amount of human energy?

Give five minutes thought to your own department each evening for a week or two, then write down what you have thought out and put it in the suggestion box. Perhaps you will win a five or ten dollar prize; at least it will show the firm you are thinking and trying to produce more and better work at a time when we most need it.

Chamfering Corners of Hardwood Boxes

Usually this job is for the operator on the shapers, and if he has a high speed machine he is in a position to handle the job in a satisfactory way, otherwise the work will have to be fed slow or the grain will be torn and chipping in places.

One of the few men who created an idea is willing to convey this idea to anyone who can use it to any advantage, and which has proven very successful. Use a circular saw ¼" thick and 8" in diameter on a high-speed horizontal arbor and run the boxes over this saw. The boxes are positioned and guided by a simple stationary trough which straddles the saw; thus the operator has no difficulty in holding the box up to the cutters as it assumes the correct position of its own accord. The operator pushes the boxes across the trough at a fast rate and the finished chamfer is remarkably smooth. This is accounted for by the fact that the cutting circle is large, the trim speed correspondingly high and more cutters are brought into action. The saw will stay sharp for a week at a time while in almost continuous service.

"ENAMELS"

Our business in both White and Old Ivory Enamels and Primers has trebled during the past year.

WHY?

They are the best on the market. If you are not using them, write for samples and prices.

The Ault & Wiborg Co. of Canada, Ltd.
Varnish Works

Increasing the Speed and Decreasing the Cost of Your Finishing Room Operation

How practical, how advantageous and how dependable Aeron spray-finishing equipment is, has been demonstrated in finishing rooms of every size and line.

Not merely in dozens of finishing rooms, but in thousands of them. Not only where a few different kinds of articles are handled, but where every kind, size and grade of wood or metal product is finished. Not alone where varnishes, enamels or lacquers are used, but where every kind of liquid finishing material is applied.

Aeron Finishing System (Surpasses Brushing)

Spray-finishing Equipment

offers a complete, adaptable and guaranteed service. The finishing operation is speeded up 4 or 5 times over hand-brushing. A perfect, uniform coating is applied on all jobs. Working conditions are made more healthful and safer. Operating and upkeep costs are reduced to the minimum. In all, the use of the equipment insures an improved, faster production at a lowered cost.

With your consent, we'll gladly tell you whether and how the Aeron System can be of service and profit to you.

The DeVilbiss Mfg. Co.

3718 Detroit Ave. ***Toledo, O., U.S.A.***

Paint your factory walls faster and better with the Aeron System Portable Painting Equipment. Let us explain.

High Grade Stains and Fillers

In our Stains you will find the highest possible color values—they are positive—they are permanent. Manufactured in quantities from the best quality raw materials.

Wood Fillers also that have been tested under the most difficult of varying circumstances and found satisfactory.

Eliminate trouble in your finishing department by using these tested materials.

Most efficient and economical air finishing system known. One of our many popular (completely equipped) air finishing outfits as used by furniture plants everywhere. Made in various sizes to meet all needs. Applies liquid materials —all kinds.

Paasche Air Brush Co. 1229 Washington Blvd., CHICAGO

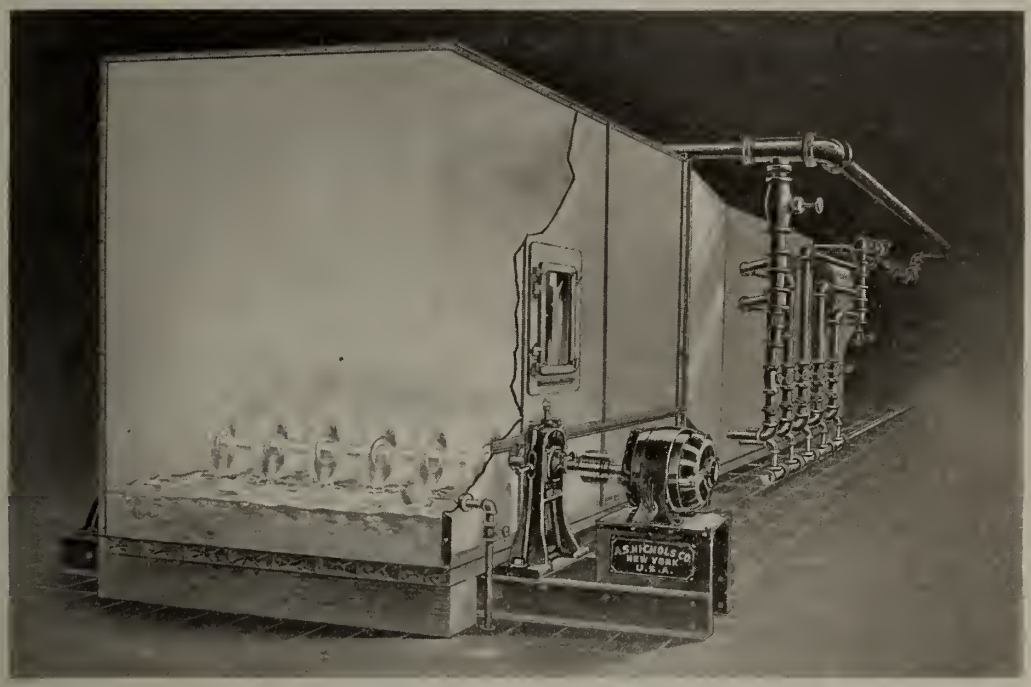
Paasche Portable Painting Outfits are extensively used for Painting Interiors and Exteriors. If interested write for catalog.

The Nichols' Varnish and Paint Dryer

A complete unit of fan, motor, heaters, air compressor, with automatic humidity and temperature controls.

A new rotary humidifying air washer, which eliminates all dust and dirt, does away with all spray heads, pump and connecting piping.

Manufactured in sizes suitable for all requirements.



DO YOU KNOW:

That the finest pianos, talking machine cabinets, furniture, and automobiles are finished by this method?

That the finish can be dried cleaner, faster and better in this way than by any other method? That the work is more durable and stands up better?

That all varnish shrinkage takes place in the DRYING ROOM, coat by coat, during the drying period, and not days or months later in show room or home?

That on cold mornings the finishing room can be quickly warmed, increasing comfort of men, coating efficiency, and condition of varnish?

That the finishing room can be properly ventilated and the health, working conditions and comfort of the workmen much improved?

That these results are obtained the year round, in Summer and Winter(irrespective of outside weather conditions?

That the investment pays for itself in one year or less?

These are FACTS and guaranteed by the A. S. Nichols Company, Sole Agents for all territory East of the Ohio, Mississippi and Detroit Rivers, in the United States and Canada. We are prepared to answer questions and quote prices on any drying problem. Communications covering varnish drying propositions west of the above mentioned territory, should be addressed to the Drying Systems Incorporated, Chicago, Ill.

We also continue to manufacture the Nichols' lumber and veneer dryers that we have been making for over thirty years.

Veneers and Panels

Would You Lay Five Ply in One Operation?

Is This a Good Method to Follow?—Certain Points That Require Special Attention—Present Problems of Its Own

By S. H. Johnstone

"Is it possible and advisable, in making five-ply panels, to lay the crossbanding and the face veneers in one operation? I have done it both ways but am now laying the different plies at the same time by running the crossbanding through a glue spreader and laying down first the back, then crossbanding, core, crossbanding and face veneer. Have had a little trouble with some of these panels, and before changing back would like to find out if there is anything wrong with this method and what is the best practice."

The above extract was taken from a letter sent in by a well-known furniture maker. It raises a question which, no doubt, has claimed the attention of many manufacturers of built-up stock. A desire for high production might tempt a manufacturer to adopt the quicker and easier method, while caution and experience might suggest that laying a five-ply panel in two operations was the safer procedure.

Here is a question which might be discussed to good purpose. Expressions of opinion and suggestions are invited on the advisability of laying five ply in one operation and how satisfactory results may be obtained. Read Mr. Johnstone's article and then let us hear from you.—The Editor.

The ideal method, if quality of product and freedom from trouble are the sole considerations, is to prepare the cores from sound, dry stock, eliminate the moisture from the wood surrounding the glue joints before surfacing, lay crossbanding, dry thoroughly, sand with drum sander and finally lay the face stock. When such a schedule is followed and due attention given to every detail of each operation, the results are all that could be desired.

What happens if the crossbanding and outside veneers are laid in one operation? Perhaps nothing. The resultant panels might be all that one would wish for, and then again they might not. When laying five-ply panels in one operation, any one of a number of troubles may occur. Do not take this to mean that it is not practical or advisable to lay the panels in this way for many concerns are doing it with apparent success and with very little trouble. There are, however, certain points which must be considered and certain precautions which should be taken.

Prevent Face From Sanding Through

In the first place rotary cut crossbanding varies in thickness and is inclined to run thick and thin in spots. If the crossband core is laid first and sanded, these inequalities will be removed. When the five-plies are glued in one operation, all inequalities and variation in thickness must be rectified when sanding the face stock, with the result that often the veneer is sanded through where the high spots occurred. This may be overcome, to a large extent, by using thicker face stock. We may take for our first precaution that it is not advisable to employ thin face veener, such as 1/25" or 1/28," when laying all plies in one operation. The material should be 1/20" thicker.

As all variations in thickness in any of the plies or core results in an uneven distribution of pressure, even greater attention must be given to the cauls and their care. If this is not done, a certain amount of trouble will be experienced from loose veneer and blisters. The second precaution is that all cauls should be kept clean, inspected at regular intervals and all hollows and worn spots worked out.

What About the Core?

The cores must be given careful attention. A layer of 1/20" crossbanding and one of 1/20" face stock will not overcome planer marks, rough spots and other imperfections in the core. As instanced before, when the three-ply cores are laid separately, such faults will be partially, if not wholly, rectified when the crossbanded core is sanded. The third precaution then will be to give special attention to the surfacing and sanding of the core proper and also to the selecting of the crossbanding.

The question of the time required to place the work under pressure is also of utmost importance. Unless this part of the work is hastened, the crossbanding may expand, buckle and overlap, thus spoiling the whole panel. As it takes a little longer to lay up a press-load of five-ply than of three-ply, if the same number of panels are handled, those laid first will be able to take up an unusually large quantity of moisture before the pressure goes on. For our fifth precaution, utmost speed in applying pressure, even to the extent of working smaller press loads.

If Animal Glue is Used

With cold glues, like vegetable and casein, the question of applying heat does not enter, but when using animal glue, this is a very important point. The reason for using warm cauls when working with animal glue, is to warm and soften the glue which may have become chilled and thick. Unless this glue is warmed in this manner, it will not hold the different plies together. When laying five-plies in one operation, to reach the second glue line, the heat must travel through two plies of wood. It is doubtful if the amount of heat in the ordinary caul would penetrate this far. If it does, it may not raise the temperature to which the cauls should be heated (they should never be so hot that they cannot be handled comfortably with bare hands), any additional heat must be supplied by warming the core and crossbanding. As a sixth precaution, the core and crossbanding should be warmed when using animal glue.

The core, crossbanding and face stock must be thoroughly dry before laying. If no provision has

been made for redrying the veneer material, it can be dried between hot cauls. The seventh precaution is to see that all materials are thoroughly dry. This is of vital importance.

The glue in five-ply panel laid in one operation will take longer to set than if the work were done in two operations. This is because more moisture was introduced by the larger amount of glue applied. To permit the glue to set and harden before the pressure is released, the eighth precaution will be to leave the stock in the retaining clamps for a longer period, fully 24 to 36 hours.

As an unusually large amount of moisture was introduced with the glue and as there is more wood from which it must be removed, greater attention must be given to the drying of the panel. Not only should it be left in the drying room for a longer period but greater attention must be given to the piling and sticking. If the panels are dried in a room or kiln in which the temperature and humidity are constant, a stated drying time may be worked out, but if allowed to dry under ordinary atmospheric conditions, the drying period must be long enough to ensure that all moisture has been eliminated. As a ninth and last precaution, give special attention to the drying of the panels, and make frequent tests to ascertain the moisture content of the dried panels.

New Rules Governing Rotary Cut Veneers

Rotary Veneer Section of American Hardwood Manufacturers' Association Adopt New Rules—Definition of Standard Grades—Effective Immediately

At a meeting of the Commercial Rotary Veneer Club of the American Hardwood Manufacturers' Association, held recently in Memphis, Tenn., a new sales code and set of grading rules were adopted. These will be put into effect without delay.

The officers elected for the ensuing year are S. M. Nickey, Nickey Bros., Inc., Memphis, Tenn., chairman; E. B. Snyder, Memphis, vice-chairman; J. C. Hill, High Point, N.C.; Dan Stewart, Tuscaloosa, Ala., T. V. Ashby, Jackson., Miss., and W. J. Lovelace, Cotton Plant, Ark., directors.

The new rules and sales code are as follows:

Sales Code

When quotations, orders or contracts covering the sale of Commercial Rotary Cut Veneers are made or entered into with members of the American Hardwood Manufacturers' Association and contain the clause "subject to the sales code and inspection rules of the Commercial Rotary Veneer Department of the American Hardwood Manufacturers' Association, adopted December 1, 1920," all transactions shall be governed and controlled (with such exceptions as are specifically made in writing) by the said sales code and inspection rules.

All quotations are made subject to prior sale, immediate acceptance, change without notice and purchaser's credit rating proving satisfactory to the seller. If during the life of any order or contract the financial responsibility of the purchaser becomes impaired or unsatisfactory to the seller, then cash payment for accounts due or goods to be shipped may be demanded and in default of which the order or contract may be cancelled by the seller.

Orders, Contracts, Acknowledgments

All orders or contracts shall be in writing and signed by both parties or signed by the buyer and accepted in writing by the seller.

All orders or contracts are subject to the approval and confirmation at the main or home office of the seller and are not binding unless confirmed in writing.

Acknowledgment of orders by the seller shall state fully and in detail the sellers' understanding of the order or contract and shipment to be made in accordance herewith. Omissions, errors or misunderstandings should be corrected by the purchaser by return mail.

Any changes or alterations in an order must be agreed to and confirmed by both parties.

All details in regard to specifications, grade, part piece stock, the dimension in length with the grain and the dimension in width across the grain and all other details must be explicit.

Loss or Damage in Transit

The seller does not guarantee safe delivery nor insure against breakage, loss or damage to material while in transit.

Dimension Stock

Orders for log run, sheet stock or dimension cut veneer are not subject to cancellation, unless the seller fails to have the stock ready for shipment within the time specified and then the buyer must give the seller ten days' notice to ship the goods or any portion of the order that is ready for shipment before the order can be cancelled and the seller shall have the right to ship that portion of the order ready for shipment or that portion that is cut and in process of drying.

Invoices

Promptly upon acceptance of shipment by initial line of railroad, the seller shall mail to the purchaser an invoice, giving full information in connection with the shipment. Invoice to bear date coincident with bill of lading, and errors, omissions, etc., are subject to correction.

General Contingency Clause

Quotations are based upon and orders and contracts accepted under a "General Contingency Clause" which recognizes that the seller shall not be held liable for delays or non-delivery of material when occasioned by strikes, floods, fires, epidemics, inability to secure cars, delays of carriers or any other cause whatsoever beyond the control of the seller, and shipments and deliveries may be delayed or suspended until such causes and their effects have been removed.

Terms of Payment

All stock is sold on a basis of "f.o.b. mill, net cash thirty days from date of invoice."

If the buyer desires, and it is agreeable to the seller, then settlement may be made by ninety day acceptance, provided acceptance is furnished to the seller within ten days from the date of the invoice and, further, provided that the buyer shall pay interest

to the seller for the period of time taken beyond thirty days from date of invoice and interest shall be at current banking rate and acceptance shall be made payable in funds at par in the federal reserve bank district in which seller is located.

Reinspection or Remeasurement

In the event of complaint by the buyer on the quality or grade of the material shipped, the purchaser shall receive and unload shipment and hold any rejected or disputed material intact, properly protected, and shall, within five days from receipt of shipment, file complaint with the seller. If the complaint is on measurement or on both inspection and measurement, the entire contents of the carload must be held intact and payment of the freight charges or of the invoice shall not be considered as an acceptance of the shipment by the buyer nor shall such payment work a forfeiture of the right of the buyer to enter complaint and to have adjustment of same.

Upon receipt of complaint from the purchaser and in the event an adjustment cannot be made between the seller and the purchaser, then the seller may request the American Hardwood Manufacturers' Association to appoint an arbitrator to provide reinspection or remeasurement, as the case may be, according to the inspection rules of the Commercial Rotary Veneer Department of the association in effect at the time of the execution of the contract and the purchaser shall lend all reasonable assistance to facilitate the inspection or remeasurement.

A certificate is to be issued by the arbitrator, showing the name of the seller and the purchaser and the results of the reinspection or remeasurement and the original copy of this certificate to be mailed to the seller and duplicate to the purchaser.

The party at fault shall pay all costs of such reinspection or remeasurement and the decision of the arbitrator shall be binding upon both the purchaser and seller.

The purchaser shall accept all material of the grade and kind purchased and all of the lower grade of material, not to exceed ten (10) per cent, and pay for said lower grade material at the proportionate price to be fixed by the arbitrator.

General Rules

All rotary cut stock shall be of uniform and standard machine gauged thickness. Stock of all grades and kinds must be cut solid and dried so that it will not mould or damage in transit and be sufficiently flat to straighten under the press without splitting.

Surface dimensions shall always be given: first, the thickness; second, the width across the grain; and, third, the length with the grain.

All specifications for special stock, not covered by these rules, shall be a matter of special contract between the buyer and the seller.

Measurement

All log run and sheet stock of random widths shall be measured by taping and all dimension stock, in all grades, shall be computed on the basis of the sizes given without allowance for trimming.

The standard grades of commercial Rotary Cut Veneer shall be as follows:

1. Faces.
2. Backs.
3. Dimension Stock.
4. Drawer Bottoms.
5. Crossbanding.
6. Core or Center Stock.
7. Unselected Log Run.
8. Unselected Sheet Stock.

Cutting

The word "cutting" as used in these rules means a portion of a sheet of veneer obtained by cross-cutting or ripping, or both. The terms "clear face cutting" as used in these rules means a portion of the sheet of the veneer to be face grade and to be obtained by cross-cutting or ripping, or both.

GRADES

Faces

Stock of any thickness, in any kind of wood, unselected for color and shall be free from all defects except slight splits that will close in laying. Selected or figured face stock of any thickness to be the same grade as face stock except it shall be selected as to color or figure.

Backs

Stocks of any thickness, in any kind of wood, and shall admit sound defects and pinworm holes and splits not open to exceed 1-8" in width.

Dimension Stock

All dimension stock, in any thickness, in any kind of wood, shall be machine cut to the length specified and if allowance is desired for trimming specifications should be for length required, including trimming, and stock is to be billed and measured at actual length cut and all dimension sizes may be a trifle full as to width. Unless otherwise specifically stated all stock for dimension sizes is to be cut to the sizes specified in one piece stock and in addition to include what part pieces the logs produce. Part pieces are to be of sufficient width to make allowance for jointing and part pieces are to be as wide as possible.

All dimension stock must be cut reasonably square.

Standard Drawer Bottoms

Stock of any thickness, of any kind of wood, to be unselected for color. To be free from splits but may permit small tight knots; otherwise to be face grade.

Crossbanding

Stock 1-16" or less, in any thickness, in any kind of wood, to be unselected for color, free from open defects but shall admit pinworm holes, sound discolorations and splits that will close in laying. (Splits to be not more than 10 per cent of the length of the peice.)

All stock not exceeding 40" in length shall contain the following percentages of whole sheets:

All stock up to and including 30" widths, 50 per cent whole sheets.

All stock 31" to 44" widths, inclusive, 40 per cent whole sheets.

All stock 45" to 59" widths, inclusive, 35 per cent whole sheets.

All stock 60" to 73" widths, inclusive, 25 per cent whole sheets.

All stock 74" to 86" widths, inclusive, 15 per cent whole sheets.

(On piece stock 1-2" must be allowed on each piece for jointing).

Core or Center Stock

Stock of 1-15" or thicker, in any kind of wood, to be unselected for color, to be free from open defects, but shall admit pinworm holes, discolorations, splits that will close in laying and other sound defects. (Splits

to be not more than 10 per cent of the length of the piece.)

All stock not exceeding 40" in length shall contain at least the following percentages of whole sheets:

All stock up to and including 30" widths, 50 per cent whole sheets.

All stock 31" to 44" widths, inclusive, 40 per cent whole sheets.

All stock 45" to 59" widths, inclusive, 35 per cent whole sheets.

All stock 60" to 73" widths, inclusive, 25 per cent whole sheets.

All stock 74" to 86" widths, inclusive, 15 per cent whole sheets.

(On piece stock 1-2" must be allowed on each piece for jointing).

Unselected Log Run

Unselected red gum, selected red gum, tupelo, cypress, yellow pine, yellow poplar, basswood, beech, elm, maple, ash, sycamore, hackberry and cottonwood must grade at least 50 per cent clear cutting in face grade and no cutting to be considered that is less than 6" wide by 24" long in all thicknesses up to and including 1-15", the stock shall be 6" and up wide; to be 48" and up long and at least 50 per cent 60" and longer.

In thicknesses of 1-12" and thicker, the stock shall be 6" and up wide; to be 36" and up long and at least 50 per cent 60" and longer.

Selected log run shall be of the same specifications except that it shall be selected for color.

Unselected Sheet Stock

Red oak, white oak, selected red gum, unselected red gum, cypress, yellow pine, yellow poplar, ash, walnut, cottonwood, tupelo and black gum of any thickness, must grade at least 75 per cent clear cutting in face grade and no cutting to be considered that is less than 6" wide by 24" long.

In all thicknesses up to and including 1-15", the stock shall be 8" and up wide; to be 48" and up long with at least 50 per cent 60" and longer.

In all thicknesses of 1-12" and thicker, the stock shall be 6" and up wide, at least 85 per cent 11" and wider; to be 36" and up long, at least 90 per cent 60" and longer, and must have 75 per cent of the total 86" and longer.

Selected sheet stock shall be of the same specifications except that it shall be selected for color or figure.

Where crating is specified on sheet stock grades, the veener shall be crated to length random widths.

(In red and white oak, unselected sheet stock, bright sap which shows the same character and grain figure as heartwood shall not be regarded as a defect.)

The Question of How Many Plies

In making up plywood for a particular use the question frequently arises, Should three plies or more than three be used to obtain the required thickness? Some data from tests by the U. S. Forest Products Laboratory may be of assistance in answering this question.

An increase in the number of plies results in a decrease in the tensile and bending strength parallel to the grain of the faces and an increase in the corresponding strength at right angles to the grain of the faces.

If the same bending or tensile strength is desired in two directions, parallel and perpendicular to the grain of the faces, the greater number plies the more nearly the desired result is obtained. It must be borne in mind, however, that plywood with a large number of plies, while stronger at right angles to the grain of the faces, can not be so strong parallel to the grain of the faces as three-ply wood, and hence a three-ply panel is preferable where greater strength is desired in one direction than in the other.

Where great resistance to splitting is necessary, as in plywood that is fastened along the edges with screws and bolts and is subjected to forces through the fastenings, a large number of plies affords a better fastening.

It is common experience that a glued joint is more likely to fail when thick laminations are glued with the grain crossed than when thin laminations are glued. The same weakness exists in plywood when thick plies are glued together. When plywood is subject to moisture changes, stresses in the glued joint due to shrinkage are greater for the thick plies than for the thin plies. Hence in plywood constructed with many thin plies the glued joints will not be so likely to fail as in plywood constructed with a smaller number of thick plies.

Wood, as is well known, is a non-homogeneous material, with widely different properties in the various directions relative to the grain. This difference must be recognized in all wood construction, and the size and form of parts and placement of wood should be such as to utilize to the best advantage the difference in properties along and across the grain. Were wood a homogeneous material such as cast iron, having the same strength properties in all directions that it has parallel to the grain, it would be unexcelled for all structural parts where strength with small weight is desired.

The Forest Products Laboratory has found that the tensile strength of wood may be 20 times as high parallel to the grain as perpendicular to the grain, and its modulus of elasticity from 15 to 20 times as high. In the case of shear the strength is reversed, the shearing strength perpendicular to the grain being much greater than parallel to the grain. The low parallel-to-the-grain shearing strength makes the utilization of the tensile strength of wood along the grain difficult, since failure will usually occur through shear at the fastening before the maximum tensile strength of the member is reached.

The large shrinkage of wood across the grain with changing moisture content may introduce distortions in a board that decrease its uses where a broad, flat surface is desired. The shrinkage from the green to the ovendry condition across the grain for a flat-sawed board is about 8 per cent and for quarter-sawed board about 4½ per cent, while the shrinkage parallel to the grain is practically negligible for most species.

It is not always possible to proportion a solid plank so as to develop the necessary strength in every direction and at the same time utilize the full strength of the wood in all directions of the grain. In such cases it is the purpose of plywood to meet this deficiency by cross banding, which results in a redistribution of the material.

In building up plywood a step is made in obtaining equality of properties in two directions, parallel and perpendicular to the edge of a board. The greater the number of plies used for a given panel thickness, the more homogenous in properties is the finished panel. Broadly speaking, what is gained in one direction is lost in the other.

Uniform Specifications For Built-Up Panels

Important Step by Plywood Manufacturers—Tend to Eliminate Friction and Misunderstanding—Should Have Far Reaching Effect

At a meeting of Plywood Manufacturers' Association, held recently in Chicago, grading rules covering the various grades of panels, in both plain and figured woods, were brought down and adopted. This is a step in the right direction, as not only will it tend to standardize the products of the different panel plants, but will establish a basis upon which both buyer and seller can settle all disputes which may arise. Other important questions such as cost and freight rates were discussed. It was also decided to join the National Veneer and Panel Manufacturers' Association in their campaign to advertise built-up products.

The rules covering built-up panels are as follows:

FIGURED WOODS

A. A. A.

Applies to figured face veneers, center, butt and pattern matched. Otherwise like "AA."

A. A. (Extra Grade).

Faces

Carefully matched for figure and color.
Veneers clear and free from all defects such as sap, stains, worm holes, sound knots, etc.
Machine sanded, belt finished.
All joints glued.

Face Crossings

One piece, clear stock, tight cut.

Lumber Cores

Mixed lumber core not permissible.
Knots and defects all cut out.
All joints machined and tightly glued.

Rotary Cores

Stock one piece or glue joints clear of defects, smooth and well out.

Back Crossings

Same as face crossings, but more than one piece permitted when jointed and taped.

Reject Backs

Not used in this grade unless requested.

Sound Backs

Jointed veneers with tight joints; veneers not matched for color or grain; burls, pin knots, patches properly made; mineral stains or natural discolorations in live timber not a defect. Scraped or sanded.

A (Standard Top Grade).

Faces

Random figure.
Average matched for color.
Streaks, small stains, sound pin knots allowed.
Scraped or sanded.

Face Crossings

Piecing permitted, properly jointed and taped.

Lumber Cores

Any suitable core wood.
Sound knots, patching and minor defects permissible.
Sawed joints allowed.
Slightly open joint permissible.

Rotary Cores

Piecing permitted, properly jointed and taped.

Back Crossings

Same as face crossings.

Reject Backs

Veneers may have doze, stain, small knots with bark or pith in centers, pinworm holes; end checks; loose or rough cutting. Open joints permitted.

Sound Backs

Jointed veneers with tight joints; veneers not matched for color or grain; burls pin knots, patches properly made; mineral stains or natural discolorations in live timber not a defect. Scraped or sanded.
Standard Top Grade.

PLAIN WOODS

B (Standard Grade)

Faces

Clear veneers, selected and matched for color.
Properly jointed and taped.
Scraped or sanded.
Properly made patches permitted.

Face Crossings

Piecing permitted, properly jointed and taped.

Lumber Cores

Any suitable core wood.
Sound knots, patching and minor defects permissible.
Sawed joints allowed.
Slightly open joints permissible.

Rotary Cores

Piecing permitted, properly jointed and taped.

Back Crossings

Same as face crossings.

Reject Backs

Veneers may have doze, stain, small knots with bark or pith in centers, pinworm holes; end checks; loose or rough cutting. Open joints permitted.

Sound Backs

Jointed veneers with tight joints; veneers not matched for color or grain; burls, pin knots, patches

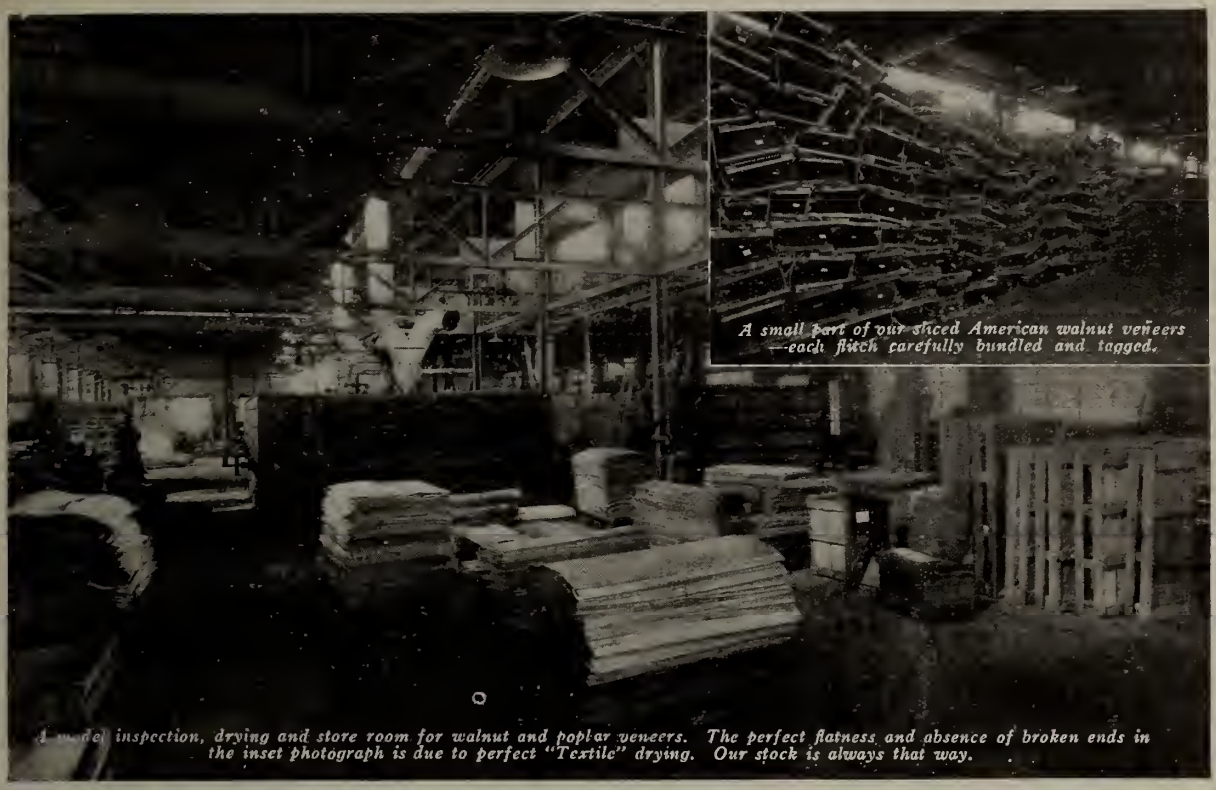
Years of Experience Behind Our Products

The Munising Woodenware Co.
MUNISING, MICH.



A small part of our sliced American walnut veneers —each flitch carefully bundled and tagged.

A model inspection, drying and store room for walnut and poplar veneers. The perfect flatness and absence of broken ends in the inset photograph is due to perfect "Textile" drying. Our stock is always that way.

An Always Dependable Product and Service

BECAUSE our organization was built with careful thought to each detail we are able to back up that statement. Each department was carefully planned and organized to get a definite result—a final product of unsurpassed quality. This involves a rigid selection of logs by trained log buyers operating over a wide territory; the most perfect of equipment, and the correct use of each modern machine. The product is then handled as it should be right up to your factory. Our four band mills and three veneer mills manufacture the best obtainable in quartered and plain white oak lumber, sawed quartered oak veneers, walnut lumber and sliced and rotary cut walnut veneers, rotary cut yellow poplar crossbanding and a general line of high-grade southern hardwoods.

properly made; mineral stains or natural discolorations in live timber not a defect. Scraped or sanded.

C (Exposed Work)

Faces

May contain jointed veneers with tight joints; veneers not matched for color or grain; burls, pin knots, patches properly made; mineral stains or natural discolorations in live timber not a defect.

Scraped and sanded.

Face Crossings

Piecing permitted without jointing or taping.

Lumber Cores

Any suitable core wood.

Sound knots, patching and minor defects permissible.

Sawed joints allowed.

Slightly open joints permissible.

Rotary Cores

Piecing permitted without jointing or taping.

Back Crossings

Same as face crossings.

Reject Backs

Veneers may have doze, stain, small knots with bark or pith in centers; pinworm holes; end checks; loose or rough cutting. Open joints permitted.

Sound Backs

Jointed veneers with tight joints; veneers not matched for color or grain; burls, pin knots, patches properly made; mineral stains or natural discolorations in live timber not a defect.

Scraped or sanded.

D (Semi-Exposed)

Faces

Veneers may have doze, stain, small knots with barks or pith in centers; pinworm holes plugged; closed end checks; lose or rough cutting glued tight.

Slightly open joints permitted.

Scraped or sanded.

Face Crossings

Made in 3 ply only.

Lumber Cores

Not made with lumber cores.

Rotary Cores

Piecing permitted without jointing or taping.

Back Crossings

Made only in 3 ply.

Reject Backs

Veneers may have doze, stain, small knots with bark or pith in centers; pinworm holes; end checks; lose or rough cutting.

Open joints permitted.

Sound Backs

Jointed veneers with tight joints; veneers not matched for color or grain; burls, pin knots, patches properly made; mineral stains or natural discolorations in live timber not a defect.

Scraped or sanded.

Remarks

Used for case and mirror backs; and drawer bottoms where panels are semi-exposed.

D. D. (Concealed Work).

May be of any kind of wood and may contain open joints or checks not over ½ inch wide, 12 inches long or half the length of the panel if under 24 inches long.

Types of Workmen

A study of the strong and weak features of those under him will often assist a foreman in perfecting his organization, improving the efficiency of the men, and securing better results. The following helpful suggestions may be of interest:

The "conceited fellow" works better for compliments, or for a chance to prove himself to the foreman a smarter man than he is.

The "trouble-maker" must be kept busy. The foreman should keep him doing political work for him, instead of political work against him.

The "lay-off pest" needs careful attention. A good way to get at this fellow is to have another man on his job when he returns, then give him something lower down the scale.

The "careless man" should, for the good of shop discipline, be made to pay for his mistakes.

The "thick-headed fellow" should be encouraged as much as possible, to see if there is really anything in him that will come out under coaxing or pressure.

The "quarelsome man" should either be worked alone or put in a gang where it is to the best interest of the firm not to have too much harmony—an excess of this may not be always an advantage, and a foreman can often capitalise even on discontent.

The "slow worker" should especially be taught short cuts, and be given the best possible equipment

The "old men" should be taken care of, but not "babied"; they should be encouraged to think themselves as important as the young blood, but not overloaded.

The "tinker"—the million-idea man—should be given the plainest and most simple of jobs.

The "religious man," the man who is completely carried away with his church, should not be encourged to talk his "shop"; but the foreman should not allow anyone to make sport of him.

The "lazy man" needs a lot of the foreman's help. If he is kept too busy to be lazy, and has often to show results, it will be the foreman's fault if he doesn't throw it off.

The "relative" should be given a good chance to make good, and the foreman should see that he does make good, but must not carry him along on his back if he does not hold his end up. A brother, a son, or some other kin, can sometimes thoughtlessly demoralize any organization.

Basic Cause of Warped Panels

The warping of the panels, whether three or five-ply, is due to the expansion or contraction of the wood, which in turn is caused by the absorption or elimination of moisture. That being the case, moisture may be taken as the root of all warping and twisting. In general terms if warping and twisting is experienced, the cause is that either the panel has not been dried thoroughly and is giving up its moisture or that it has been dried too much and is taking moisture from the air. The former is likely to be the cause in nine cases out of ten, and suggests its own remedy. Another point is that the taking up of moisture from the air tends to release certain strains which have been more or less equalized and which have been resisted by the setting of the dry wood. When released, these strains often cause the panel to warp to a greater degree than the amount of moisture taken up would seem to warrant.

Our best Advertisement is a Trial Order

We have a large stock of American Walnut, Mahogany, Quartered Oak (in all thicknesses) Figured Gum Veneers and Rotary Cut Veneers—all ready to fill your order.

Our products are strictly high grade.

Let us hear from you.

Foreman Says Wages Should Not be Reduced

Outlines Attitude of Mechanic—Increased Production Rather than Lower Wages is Solution—Employer Must Provide Suitable Equipment

By W. G. C.

I notice that the theme of wage reduction has gained considerable impetus lately in many newspapers and trade periodicals, but try as I will, I cannot remember any such agitation amongst manufacturers a few years ago as to how high they could raise wages to meet the ever-increasing cost of living. Now to discuss a few of the questions found on Page 77 of the January 1st "Canadian Woodworker." Should employees shoulder a part of the responsibility by accepting a lower wage? Not yet. Because although we often see in the press about certain reductions in food, clothing, etc., having taken place, yet we very rarely find any reductions in the stores. It has not yet reached the consumer to any appreciable extent. This should be taken cognizance of in any readjustment of wages.

I went into a store yesterday to purchase a bag of flour and was advised to lay in a stock because it was going up. Sugar also in our locality has risen 1c. per lb. Meat has not been reduced at all. If the manufacturers would promise a reduction in living expenses, then I have no doubt that the employee would be content to accept a corresponding decrease in wages. The dollar is not yet what it should be in purchasing power. Why then this outcry concerning a reduction of wages? The inflation period had two years' run before the wages were raised, so why not let the deflation period have a two years' run before wages are reduced. I do not think it would be good policy to alter the wage scale at the present time.

Have Little Effect on Costs

Question 2.—Would it be to the advantage of the workman inasmuch as it might mean steadier work, etc. Notice the word "might." Can or will the manufacturers guarantee that a small reduction will give steadier work? I don't think it would have a very great effect because a 10% reduction in wages does not mean a 10% reduction in the retail price of furniture.

Question 3. How do the rates paid woodworkers compare with those in other industries? Not very good. Take plumbers, $1.00 to $1.25, iron workers 75c. to $1.00, carpenters 90c. to $1.00, clothiers up to $35 per week. Now here in this question is a point of vital importance to manufacturers of wood products. From where is your next generation of woodworkers coming? I am a foreman in a furniture factory and I find it nearly impossible to get youths of any intelligence to come in and learn the trade. Why? Because there is not enough money at the end of it. Why should the woodworking industry pay less than other industries? Do not your mechanics require to have as much technical education or knowledge as other trades? Do they not take as much risk. Are they an inferior kind of workmen or what is the matter that they should get not much more than half the wages paid in other lines of endeavor?

Must Make Calling Attractive

If you want your old mechanics back in the trade, those who quit in war time to go to more remunerative jobs and trades, you will have to pay the money. Let me give you one of the psychological effects that low wages have upon the employee of furniture manufacturers. When wages are so reduced that the employee generally speaking cannot purchase his own products, he gets dissatisfied with his own domestic surroundings. This discontent is reflected in his conduct toward his work. A dissatisfied workman usually turns out unsatisfactory work. If such a man has any ambition, he looks out for something more remunerative, and away goes another mechanic lost to the trade.

Now the furniture industry has not a glut of highly-skilled mechanics that it can play fast and loose with those it has already got, therefore at present I think it would be poor policy to reduce wages.

Another point. If wages were reduced, the employee would have still less money to beautify his home; therefore, what little that would be gained by cheaper production would be lost because he would have no surplus with which to buy.

Aim at Increased Production

On the same page in the January "Canadian Woodworker" a representative Ontario woodworker puts it very cleverly and in a very concise form, viz., "We feel sure that where an inquiry in sympathy with decent requirements is made, it will be shown quite plainly that those engaged in the woodworking industry are not receiving much, if any more, than what is generally termed a 'living wage.'" I fully endorse that sentiment and here is another thought for those to consider who call for mutual co-operation and understanding between employer and employee. Why should an employee be ground down to a living wage? There has been too much said about a living wage. Is that all a man should receive? Just enough bread and butter and no more? Should he not be allowed to give his children a better education than he himself had? I think if more stress was laid upon cheaper production and increased efficiency of both men, plant and methods instead of wage reductions, that in the end the same object would be achieved. Let the manufacturers give the mechanics a chance by providing the best possible tools to work with. Then he has a right to demand more production and greater effectiveness.

Wood Pipes in South Africa

A firm in South Africa is manufacturing wood pipe from California redwood, 2½ in. to 20 in. in diameter. These pipes are used for pressures up to 170 lbs.; they are durable and cheap, have a low co-efficient of friction, and are light and easy to transport, a great consideration in South Africa. Pipes over 20 in. are built in situ, and instead of being machine-wrapt or bound with wire, as are the smaller sizes, they are bound with heavy steel bands. When one considers that the old wooden water pipes of London, of which it is said there were 400 miles laid, lasted in use for two centuries, there is no reason why better finished, if lighter, stave pipes should not be serviceable, especially for temporary use, for irrigation on farms. The makers claim that they are from 50 per cent. to 70 per cent. cheaper than any other class of pipe.

The Lumber Market

Domestic Woods

The general improvement which is noticeable in certain of the woodusing industries has not as yet made itself felt in the lumber field. At the present time the demand for Canadian hard and soft woods is slack. It was felt that as business improved in the allied industries there would be a marked improvement in the call for lumber. This has not as yet materialized. If, however, the wood-using industries are operating, and they are, though at reduced capacities, a certain quantity of wood is being remanufactured, which means that some must be purchased in the near future to replenish the fast diminishing stocks. The February "Canadian Woodworker" contained a few prices furnished by a leading hardwood dealer, which gave his idea of the values which were current on the Toronto market. Another large wholesaler has submitted the following list as being his idea of present-day values:

4/4 Birch F.A.S.	$110.00
4/4 Birch No. 1 C. & Sel.	75.00
4/4 Birch No. 2 C.	45.00
5/4 & 6/4 Birch F.A.S.	115.00
5/4 & Birch No. 1 C.	80.00
5/4 & 6/4 Birch No. 2 C.	55.00
8/4 Birch F.A.S.	125.00
8/4 Birch No. 1 C.	90.00
8/4 Birch No. 2 C.	60.00
10/4 & 12/4 Birch F.A.S.	130.00
11/4 & 12/4 Birch No. 1 C—Sel.	105.00
10/4 & 12/4 Birch No. 2 C.	70.00
16/4 Birch F.A.S.	145.00
16/4 Birch No. 1 C.	105.00
16/4 Birch No. 2 C.	90.00

Maple prices would average from $5.00 to $10.00 lower than the above.

These figures are, with one exception, lower than those presented last month and as there has not been any drop in hardwood values, it goes to show that there is not any recognized level of prices.

Regarding operating conditions in the woods and the cost of logging, one well-known softwood wholesaler remarked that, owing to the absence of snow and cold weather hauling facilities had been unfavorable. Many teams had gone through the thin ice on open rivers. There was a danger, too, in view of the limited precipitation of snow that there would be driving difficulties in the spring owing to low water in the lakes and streams. Referring to decreased production during the present season, he estimated that in Northern Ontario the cut of white pine would be reduced by fifteen per cent. from last season; red pine, thirty per cent.; spruce, thirty-five per cent., and hemlock, twenty per cent. With respect to values, he believed that white pine would hold its own, and that practically the same prices would prevail as in 1920, with the exception of those on mill culls and dead culls, which might go very low. Red pine also would in all likelihood show a decline in values as well as spruce, of which there was a considerable quantity on the market, especially in the east. In hemlock, which was the principal lumber used for studding and other purposes in house construction, there had been a runaway market in 1920 and the price had dropped today about thirty per cent. He did not look for a change in quotations on hemlock of more than two or three dollars a thousand. In the west there had been a considerable reduction in the figure for logs, particularly in cedar and fir. On the former prices, which had during the war ranged from $25 to $40, had now declined to $15 and $25. The lumber market should be watched closely for a slight increase in demand will result in higher prices.

Imported Woods

The anticipated increase in the demand for American hardwods is still an immediate probability. Indications point to a gradual resumption of buying but at the present writing the market is very quiet. Certain of the wood-using industries, such as the furniture and automobile, are resuming operations on a limited scale, but seemingly have not found it necessary to enter the market for lumber. A distinctly optimistic tone pervades most of the American producing centres, for inquiries have been more plentiful during the last few weeks. While few of these have resulted in sales, yet the feeling is that certain industries cannot remain out of the market for very much longer. One thing is certain and that each passing month brings us that much nearer the time when buying will become more general. As all indications point to higher values as the demand increases, the woodworker who finds his stocks running low, is taking a chance when he puts off buying. He may find that he could have bought to advantage today rather than a month or two later. Most of the stocks of oak, walnut, gum, etc., are in strong hands and as present prices are at and even below the cost of production, it does not seem reasonable to expect prices to drop much further. If that is true and higher values are a possibility, the present would appear to be the logical time in which to buy. Production is low, stocks are being slowly depleted and broken up, which makes it appear that a shortage is probable in the near future. Should that occur, a mild scramble for lumber will be the inevitable result.

Mid-West Wood Turners Organize

The Charter Convention of the Mid-West Association of Wood Turners was held at Congress Hotel, Chicago, February 15th. This association is a newly organized branch of the National Association of Wood Turners.

The Convention completed the formation of the Mid-West Association, adopted Constitution and elected the following officers for the ensuing year:—President, G. S. Milhan, The J. B. Hellenberg Co., Coldwater, Mich.; Vice-President J. F. Strombeck, Strombeck-Becker Mfg. Co., Moline, Ill.; Treasurer L. A. Walker, Stephenson Mfg. Co., South Bend, Ind.; Secretary F. S. Upham, American Handle & Novelty Co., Des Moines, Ia.

The meeting was addressed by such speakers as Wm. B. Baker, Secretary of the Association of Wood Using Industries and of the National Chair Manufacturers' Association; by Wm. A. Babbitt, General Secretary of the National Association of Wood Turners and Chairman of the National Standardization Committee of the A.W.U.I., and Austin F. Hawes, forestry expert, Forester of the National Association of Wood Turners.

Information and Inquiries

You are cordially invited to make use of this department

Whole List of Questions

Calgary, Alta., March 3rd, 1921.

Editor, Canadian Woodworker:—

Will you kindly enlighten me on the following points:—

1. In your October issue, 1918, you gave a formula for standard fumed oak stain. Where can I get the necessary ingredients?

2. In an article in the October issue, 1920, a reference was made to a new process fuming liquid. Will you give me the name of the maker of this material?

3. Can you inform me what are the average quantities of the different grades produced from 1000 feet of Western pine log, with particular reference to such grades as clear, shop, No. 1 common and No. 2 common?

4. Would also like some information pertaining to the Millwork Cost Information Bureau. What is it? Can I join it? What are the dues, etc.?

Your kind compliance with this request will be appreciated.

Yours truly,
James Wright.

1. The materials required for making fuming stain can be secured from any of the manufacturers of finishing material who advertise in the "Canadian Woodworker," such as Adams & Elting Co., Toronto, Ont.; Marietta Paint & Color Co., Marietta, Ohio; Edward J. Shannon Co., Cincinnati, Ohio, and the Standard Paint & Varnish Co., Limited, Windsor, Ont.

2. The new process fuming liquid to which reference was made in the October "Canadian Woodworker," is manufactured by the Adams & Elting Co., Chicago and Toronto.

3. We have not any information pertaining to the quantities of the different grades of lumber produced from Western pine logs. In all probability I. R. Poole, secretary of the Canadian Lumber Manufacturers' Association, Nelson, B.C., will be able to give you some information on this point.

4. The Millwork Cost Information Bureau, Chicago, is an association of woodworkers who have got together and worked out an efficient cost-finding and estimating system for woodworking plants. If you will write W. P. Flint, secretary, 11 South La Salle St., Chicago, he will be pleased to give you full information.

What Causes These Pinholes?

A manufacturer of pianos is experiencing a considerable amount of trouble from pinholes and would like to have some of the readers of the "Canadian Woodworker" come to his assistance by suggesting how this objectionable feature may be overcome. The most peculiar feature of the problem is that the pinholes are to be found only on the underside of the piano tops. The work is all handled uniformly as far as is known and follows the usual procedure of staining, filling, etc. The varnish coats, with the exception of a final flowing coat, are applied by spray. What is the probable cause for these pinholes and why are they found only on one side of the tops? What is your idea?

Movement for Clock

Horseheade, N.Y., March 7th, 1921.

Editor, "Canadian Woodworker":—

Will you kindly tell me where I can secure a heavy English movement with brass dial for a hall clock. I would like to secure this complete ready for insertion in the case.

Yours truly,
F. L. Warner.

We understand that the Waltham Watch Co. make movements which are suitable for grandfather's clocks. If they are not in a position to fill your order, would suggest that you get in touch with Hirst Bros. & Co., Limited, Oldham, near Manchester, England.

Market for Wood Waste

An English manufacturer is in the market for quantities of birch squares 1⅛ in. x 1⅛ x 3 in. and ⅞ x ⅞ x 3 in. This stock might be cut from trim-saw blocks and edgings. If interested, write for name. Inquiry, 2784.

Maple Flooring Wanted

A firm in Manchester, England, are desirous of securing a large quantity of maple flooring and would like to get in touch with manufacturers or exporters who are in a position to handle overseas business. Name of above firm may be secured on application. Inquiry, 2738.

Spruce, Pine and Basswood Squares

A British concern is in the market for a quantity of spruce, pine or basswood strips 1⅛ in. x 1⅛ in. x 48 in.., tied in bundles of 30. The name of this firm will be furnished on request. Inquiry, 2783.

Be Careful About Minor Injuries

By Dr. Geo. G. O'Connell

The advisability of having all minor injuries promptly attended to cannot be too strongly emphasized. As, "From little acorns mighty oaks do grow," —so also from little cuts and scratches many bad infections arise.

With the proper medical attention given to minor injuries practically all of them heal without the formation of pus. When they are not attended, and infection or pus sets in, the healing of the wound is usually prolonged two or three times as long as it would have been had no infection resulted.

Aside from the physical pain and discomfort resulting from infection, there is to be considered the possibility of prolonged inability to carry on one's occupation with the consequent economic loss to both the employee and employer. It is to be again strongly advised that all employees immediately report all injuries, no matter how slight or insignificant they may seem.

The Mark of Conservative Merit

It is purposed that this advertisement shall carry a message of understandable value to executives in wood-using factories everywhere. In general, reputation comes when, through long years of painstaking growth, merit in goods and courtesy in service have remained supreme over many disheartening experiences. The fact, therefore, that a sound reputation has been established is, per se, evidence of unwavering cleavage to correct business principles. The successful executive will understand that. Because we can without boasting claim to have reached that position, we hope our advice to buyers of southern hardwood lumber, veneers and panels may be heeded. Our counsel "BUY NOW" is sponsored by a long record of constructive thought. Don't overload—don't speculate—but cover your next few months' needs.

News of the Trade

The Kiddie-Koop Mfg. Co., of Toronto, was registered recently.

S. Oakes, Strathroy, Ont., has started work on a new planing mill.

The Montreal Woodworking Co., Montreal, P.Q., was recently registered.

Western Upholstering Co., London, Ont., recently suffered a loss by fire.

R. H. Pugh, London, Ont., upholsterer, recently sustained a loss by fire.

The Winchester Repeating Arms Co. are contemplating erecting a plant in Canada.

The Spruce Falls Co., Kapuskasing, Ont., are erecting and equipping a planing mill.

H. A. Johnston, 412 Lake Front, Toronto, contemplates erecting 25 bungalows in North Toronto.

Richard A. Saunders, Carleton Place, Ont., has commenced the construction of a new planing mill.

Hardy Cooperage Co., Annapolis, N.S., was recently registered with N. Hardy and J. G. Hardy as partners.

Chas. E. Farrar & Sons, Greenfield Park, P.Q., were recently registered as upholsterers, with Chas. E. Farrar proprietor.

Curley & Buchanan, Dunham, P.Q., were recently registered as manufacturers of sash, doors and other forms of woodwork.

The sash and door factory of John East Co., Fort Frances, Ont., has been disposed of and will be converted into a steam laundry.

La Cie de Pianos and de Phonographes, St. Angelle de Laval, P.Q., was recently registered with J. A. Falandeau as proprietor.

The total pay roll disbursements of 51 Grand Rapids furniture factories is given as $14,697,070 for 1920, as against $10,418,815 for 1919.

The Quebec Paint and Varnish Co., Limited, Brantford, Ont., have been incorporated to manufacture a complete line of paints and varnishes.

The High Point furniture manufacturers contemplate holding an exhibition in the new furniture exposition building from May 1st to May 15th.

Certain changes have been made in the organization of the Continental Upholstering Co., Montreal, P.Q. M. H. Cohen is now the registered proprietor.

The Interior Hardwood Co., Limited, Kitchener, Ont., were recently authorized by supplementary letters patent to increase their capital from $40,000 to the sum of $300,000.

The Brown Bros. Co., 11 Broadway, New York City, offer in their advertisement in this issue a quantity of high-graded white hickory of various sizes for immediate shipment.

Industrial Products Limited, Toronto, were recently incorporated to manufacture and deal in all kinds of varnishes, japans, enamels and other finishing materials. Capital, $40,000.

J. E. L. Streight of Islington, Ont., has disposed of his planing mill and lumber yard to the Irvin Lumber Co., Toronto. It will be conducted as a branch yard by the latter concern.

The Holland Varnish Company, Limited, Montreal, were recently incorporated to manufacture and deal in varnishes, stains, polishes and other similar ingredients. Capital, $1,000,000.

The planing mill of McKenzie & Graham, Bible Hill, N.S., was destroyed by fire recently. The loss runs in the neighborhood of $40,000. The company is undecided as to its future plans.

A. E. Taylor, Hull, P.Q., has secured the Canadian rights for a well-known line of storage batteries, and contemplates securing a factory and installing equipment to handle this line.

As a sign of the times the fact that the Ford Motor Company of Canada, Ford, Ont., has reached capacity production, 225 cars per day, on a four-day-a-week schedule, is not without its significance. The assistant general manager, W. Campbell, says: "Our business is picking up in a remarkable manner, and we expect to have the factory strained to its production limit within a short time."

A survey of the furniture industries in Chicago and Grand Rapids reveals the fact that the average hourly wage in the former city is 60.3c. per hour, while 61.4c. is the prevailing rate in Grand Rapids.

Burdette & Valede, 33 St. James St., Montreal, manufacturers of soda fountains and fixtures, contemplate moving to larger premises in the near future. They are in the market for a planer and band saw.

Sanator, Limited, Montreal, P.Q., was recently incorporated to manufacture and deal in boxes, baskets and wooden containers. Capital $350,000. N. Morrissette and J. H. Petit, both of Montreal, are two of the incorporators.

J. C. Giroux, Limitee, Montreal, P.Q., was recently granted a provincial charter to manufacture and deal in all kinds of office and household furniture. Capital $20,000. J. C. Giroux and G. E. Dubuc, both of Montreal, are two of the incorporators.

Canadian Automobile Corporation, Montreal, P.Q., have been incorporated to manufacture and deal in automobiles, aeroplanes, and other wooden vehicles. Capital $600,000. Two of the incorporators are G. McTeigue and A. Mathieu, both of Montreal.

The large munition plant at Leaside, Ont., which was erected by the American Government at a cost of $8,000,000, has been taken over by the Leaside Munitions Co., Limited. It is the intention of the new owners to use this plant for manufacturing purposes.

The Canada Wood Specialty Co., Orillia, Ont., manufacturers of dowels, handles, etc., are adding a third electric enamel baking oven for baking the finish on enamelled handles. These ovens are manufactured by the Purdy Co., Limited, Oshawa, Ont.

The planing mill of S. L. Lambert, Welland, Ont., was recently destroyed by fire. The loss, which amounts to $30,000, is only partially covered by insurance. Defective wiring is given as the cause of the blaze. Mr. Lambert is not decided as to his future plans.

The W. E. Harris Manufacturing Co., Limited, Toronto, was recently incorporated as planing mill operators and manufacturers and dealers in wood products. Capital $25,000. J. F. Lucas and C. McKay, barristers, both of Toronto, are two of the incorporators.

Clarke Bros., Limited, Bear River, N.S., contemplate erecting a box factory in connection with their plant at Glenn Falls, N.B. This new factory will cost in the neighborhood of $25,000. It is expected that work on this new edition will be commenced in the near future.

A provincial charter has been granted T. H. Hancock, Limited, woodworkers and lumber dealers, Toronto, with a capital stock of $1,000,000. Mr. Hancock recently completed one of the finest and most attractive lumber offices in Canada at 1372 Bloor St. W., Toronto.

Canadian Stewart Wire Wheel Company, Limited, Montreal, P.Q., was recently incorporated to manufacture and deal in motor trucks, aeroplanes, and all kinds of wheels. Capital $300,000. Y. Ducharme and G. McTeigue, both of Montreal, are two of the incorporators.

The Celluloid Zapon Co., New York, have opened an office at 520 Walnut St., Philadelphia, Pa., with B. O. Clausen in charge. This company manufacture such lines as lacquer enamels, lacquers and varnishes, bronze liquids, and leather cloth in different shades and types.

W. L. Anderson was recently appointed general manager of the National Shipbuilding Co., Limited, of Goderich, Ont. He takes up his duties immediately. Mr. Anderson has been connected with the Sturtevant Co. of Galt, and was for several years with Messrs. Goldie & McCulloch.

Langslow, Limited, Cobourg, Ont., who recently opened a new factory in Cobourg to manufacture school, office and home furniture, have presented the public school board of that town with 30 Moulthrop moveable and adjustable chair desks. This generous gift was greatly appreciated.

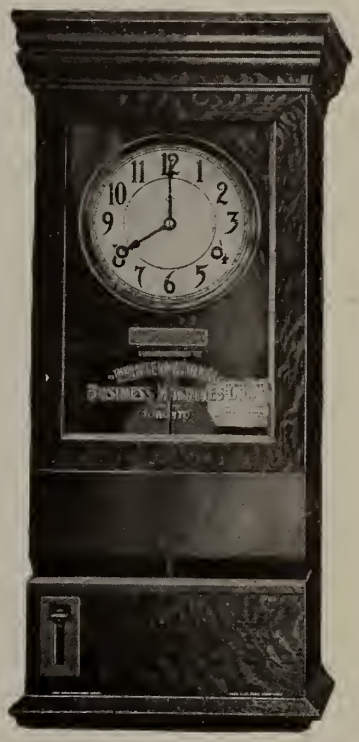
The Radford-Wright Co., Limited, Winnipeg, have under construction a large addition to their sash and door factory. When completed, their plant will be one of the largest and most up-to-date in western Canada. Several woodworking machines of the very latest type are being installed.

The office of L. L. Brown, B. C. Lumber Commissioner for Eastern Canada, was recently damaged by fire. The blaze

How much time is wasted between the factory entrance and work-bench ?

Although your workmen may enter your factory on time, do they **start work on time?** How much time is wasted between these two points in **your** factory? And how much time is lost between jobs? This is a factor in your manufacturing costs that may be greatly affecting the selling price of your products—**unjustly.**

International Time Recorders and Job Time Recorders will enable you to arrive at the exact amount and to reduce it to a minimum. The exact time each workman enters the factory is registered by the International Time Recorder. The exact time that same workman starts **productive** work is registered by the International Job Time Recorder. Then you have an accurate, unchangeable and indisputable record of the labor time you buy as a whole and the labor time that is actually productive.



It's worth some thought, isn't it? Would you like to have more interesting facts about it? We will gladly send them.

International Business Machines Co.

LIMITED

F. E. MUTTON, Vice-President and General Manager

Head Office and Factory: 300-350 Campbell Avenue, Toronto

International Time and Job Time Recorders will tell you

broke out in the kitchen of the Sheffield Lunch, which adjoins the lumber commissioners office and worked its way through into the latter office. Repairs are now being made.

The McGill-Quinn Handicrafts Products Co., Norwood, Ont., have inaugurated a direct-to-consumer sales policy. This firm is devoting their attention largely to floor lamps, but with the completion of their new factory, which will be at an early date, they propose to make a full line of wicker furniture.

The Gunn-Son-Ola Talking Machine Co., who took over the plant of the Walker-Clegg Co., Wingham, Ont., early last fall, have reorganized their factory and are putting their line of Gunn-Son-O'a phonographs on the market. Six different styles are being manufactured in such woods as oak, walnut and mahogany

The Hayes Wheel Company of Canada, Limited, Chatham, Ont., are taking on men and expect shortly to be running at full capacity. Owing to general conditions they have been operating at reduced capacity, but the brighter prospects which have opened up are so encouraging that operations are being extended.

The twenty-second annual convention of the National Association of Box Manufacturers will be held in the Florentine Room of the Congress Hotel, Chicago, Ill., on Wednesday, Thursday and Friday, April 6th, 7th and 8th, 1921. A cordial invitation is extended to all box manufacturers to attend this convention.

S. R. Rudd, of Arnprior, Ont., has taken into partnership J. H. McLean of Montreal. The firm will hereafter be known as the Arnprior Lumber & Construction Co. and particular attention will be devoted to the development of the planing mill business, the retail lumber trade and building. New equipment is being installed.

The plant of the Harris Wood Products Co., Streetsville, Ont., is to be put in operation under a new directorate. It will be remembered that this concern, which was organized last spring to manufacture a line of sectional houses, went into liquidation early in the fall. The new plans call for doors and sashes as the principal product.

At a general meeting of the shareholders of the Ideal Cabinets, Limited, Toronto, manufacturers of the Ideal Phonograph, the following officials were elected for the ensuing year: R. A. Stevenson, president; W. N. Martin, secretary-treasurer, and the above gentlemen with H. B. Kautzman and W. H. Lantz, comprise the directorate.

Elgin Handles, Limited, St. Thomas, Ont., have been granted provincial incorporation to take over the concern known as The Elgin Handle Company, and to manufacture and deal in wooden handles and other wood products. Capital, $60,000. G. P. Smith and C. E. Lewis, manufacturers, both of St. Thomas, Ont., are two of the incorporators.

The Electric Phonograph Company of Canada, Limited, Toronto, was recently incorporated to manufacture and deal in phonographs and musical instruments and to secure patents, manufacturing rights, etc., from the Automatic Products Co., Cleveland, Ohio. Capital $250,000. H. H. Gordon and J. D. Spellen, barristers, are two of the incorporators.

At a recent meeting of the Grand Rapids Market Association it was decided that the July furniture exhibitions to be held in that city will be of four weeks' duration instead of the usual three weeks' show. The reasons for this change are that a larger number of buyers usually attend the midsummer exhibition than visit the winter display, and also that a greater effort will be made this year to induce buyers to visit the market.

The plant of McFarlane Douglas Co., Limited, Ottawa, Ont., was recently damaged to the extent of $12,000 by fire. The blaze started from an explosion in a bale of cotton due to spontaneous combustion and spread rapidly to the steel door section and finishing department. The blaze was confined to these two departments by the automatic fire door which separated the woodworking department from the rest of the plant. Had the fire succeeded in reaching this latter department, a disastrous fire would have resulted.

The Office Specialty Mfg. Co., Limited, of Newmarket, recently held their annual sales convention in Toronto. In reviewing 1920 Mr. Slemin, the managing-director, stated that their progress had been phenomenal and that they had never fallen back a single month. This is very gratifying because conditions during the last six months were unfavorable to a large volume of business. An indication of the growth and development of this company is the statement that their business has been increased three and a half times in the space of four years. Branch managers from the different districts were in attendance together with a delegation from the associated company in Rochester, N.Y.

The North American Furniture Co., Limited, and the Owen Sound Chair Co., Limited, Owen Sound, Ont., recently put into effect a readjustment in wages. This was found necessary owing to the fact that substantial reductions have been made in the lines manufactured. A shop committee has also been organized in the North American plant, which consists of five employees selected by their fellow workmen and the five foremen. This committee will meet the management at least every two weeks and take up such matters as production, safety welfare, etc. This should result in strengthening the bond between management and employee as well as improving the organization as a whole.

The Canadian Phonograph Manufacturers' Association recently held their annual meeting at the National Club, Toronto. The officers elected for 1921 are as follows: W. B. Puckett, president; E. C. Scythes, vice-president; W. M. Martin, treasurer; J. G. Merrick, secretary; Export Committee, S. J. Cook, O. C. Dorian, O. Wagner; Exhibition Committee: J. D. Ford, D. A. Trestrail, A. E. Landon; Finance Committee: D. R. Gourlay, Thomas Nash and E. Van Gelder; Legislation and Tarriff Committee: A. Heintzman, J. E. Hoare, W. D. Stevenson; Nominating Committee: J. D. Ford, W. B. Puckett, D. M. Wright. The Executive Committee consists of the elected officers, together with the chairman of each of the standing committees.

The New York State College of Forestry at Syracuse, N.Y., is conducting a three-weeks' course in dry kiln. The instruction consists of a series of lectures and actual practice in operating a dry kiln, grading lumber, identifying woods and other subjects of a like nature. Arrangements have been made for representatives of some of the large lumber manufacturers, dry kiln experts, experienced graders, etc., to be present and take part in the programme. Thus the instruction to be given by the experts in the college will be supplemented by the practical experience of men from the different plants. The number of students are limited to 25, insuring personal instruction. Two of the experts of the Grand Rapids Dry Kiln Co., Grand Rapids, Mich., are delivering a series of lectures.

In February "Canadian Woodworker" a reference was made to the box plant that the Canadian Libbey-Owens Sheet Glass Co., contemplate installing in their Hamilton plant. In error the address of the above firm was given as "Toronto" instead of "Hamilton." The Canadian Libbey-Owens Sheet Glass Co., is the Canadian branch of the American Libby-Owens Sheet Glass Co., of Charlston, W. Va. At the present time work is proceeding on their large factory at Hamilton. It is in connection with this new plant that they propose installing sufficient box-making equipment to enable them to take care of their own requirements. They are in the market for the necessary machines. J. W. Hobbs of the Consolidated Plate Glass Co., Toronto, is vice-president of the Libbey-Owens Co.

The oak screen, which is to flank the speaker's chair in the House of Commons, Ottawa, recently arrived from England and has been installed in place. The new chair, which is also coming from England, is not expected to arrive until early in the spring. This chair is a magnificent piece of work, 13 feet, 6 inches in heighth. It is elevated on two platforms each embellished with deeply sunk quatrefoil tracery. Old oak beams from the roof of Westminster Hall provided the wood for the projecting canopy, in the centre of which the royal arms are carved in bold relief. On the main panel behind and above the seat is the royal mace and sceptre in a design of conventional oak foliage. This chair is a replica of the speaker's chair in the British House of Commons and has been constructed with the strictest fidelity to the original model, each intricate moulding and even the jointing having been followed exactly. The sculptors and carvers worked from plaster casts and photographs so that the work would not vary in the minutest detail. It is hoped that the speaker of the British House will be able to visit Ottawa and make the formal presentation.

Personal

C. O. Maus, of the Hyde Lumber Co., South Bend, Ind., was a recent caller on the trade in Toronto.

F. C. Marquis, who has large interests in the woodworking and allied fields, was recently honored by his business associates in commemoration of his sixtieth birthday. Mr. George Cantin, manager of the Victoriaville Furniture Co.,

One reason why our Gum is Straight and Flat

Do You Know

"That you can get Gum Lumber that is **free from stain and as bright as a dollar?**

"Always thought the sap part of Gum must be discolored, didn't you? Some boards black, some a lighter shade, a few bright—**all lacking uniformity?**

"Oh! of course, the inspection rules say "stained sap is no defect," **but what do you say Mr. Manufacturer,** you who have to **cut up, work and finish the lumber?**

"We have never believed that a manufacturer of furniture, trim, finish, etc., could satisfactorily use Gum lumber in the shape it is generally put out, and we, therefore, set out to **eliminate** the **objectionable features** we have mentioned.

"Have we succeeded? **Unqualifiedly yes.** Nothing left to chance, **no guess work.**

"Every board of our KRAETZER-CURED Sap or Quarter Sawn Unselected Gum **is bright,** with a slight pinkish tinge closely resembling cherry, and **uniform throughout.**

"And it's straight and flat too, **that's another thing we've done.**

"Get acquainted with our kind, **you'll never be satisfied with the other kind again.**

"Costs only a little more in the beginning and **the final cost is less, very much less** and oh! the **satisfaction, the freedom from trouble and worry.**

"Don't be deceived by misrepresentations. Insist on the genuine. Every board bears our trade mark.

Our protection THE KRAETZER-CURED LUMBER CO. *Your guarantee*

The Kraetzer-Cured Lumber Co.

GENERAL OFFICE: GREENWOOD, MISS.

Band Mills: Greenwood, Miss., Moorhead, Miss.

Why our Gum does not stain

Our Quartered and Plain Red and White Oak, Ash, Hickory, Red Gum and Tupelo are as fine as the highest quality of virgin timber and thorough knowledge of production can produce. THERE IS NONE BETTER.

The Sidmans!

We wish to call your attention to our AUTOMATIC SUCTION SYSTEM for returning ALL condensation DIRECT to the Boiler.

Made up of a Condensing Pump Governor and Receiver, and any make of Brass Fitted Boiler Feed Pump, either steam or electric driven.

First cost from, 40% to 65% less than any other system. 15% to 30% cheaper to operate, and 60% to 80% less for repairs.

Suitable for either old or new plants. Satisfaction guaranteed in every case. Ask ANY USER.

Edw. D. Sidman
Our Consulting Engineer

We can also supply you with any Steam Specialty desired, and our own make of Du-o-fold and Three Ply Curtains.

The Sidmans of Canada

Designers of
The Sidman Lumber Curing Kiln

LONDON CANADA

thanked Mr. Marquis in the name of the employees of this firm for the valuable support he had given this organization.

W. R. Elliott, of the Pacific Box Co., Limited, Vancouver, B.C., spent a few days in Toronto recently calling on the trade.

R. A. Laidlaw, of the Laidlaw Lumber Co., Toronto, has been appointed one of the two new trustees who recently were added to the board of directors of the Hospital for Sick Children.

E. M. Stewart, of Robert Stewart, Limited, woodworkers and lumber dealers, Guelph, Ont., recently returned from a trip to British Columbia. While there he gathered facts and information concerning the B.C. lumber situation.

Obituary

Joseph Dufour, carriage manufacturer, Ottawa, Ont., recently passed away in that city.

The death of J. J. Hawkey recently occurred at Parkhill, Ont. Mr. Hawkey was a well-known carriage maker.

George Y. Chown recently passed away at his home in Kingston, Ont. Mr. Chown was interested in various enterprises, being president of the Weber Piano Co., Kingston, as well as having an interest in a Montreal paint and varnish plant.

J. A. Cole, recently passed away at his home at North Bay, Ont. He was a well known woodworker and manufacturer, having been with J. R. Eaton & Sons of Orillia, Ont., for 25 years, later operating a planing mill of his own in North Bay. More recently he was with the A. J. Young Lumber Co., North Bay, Ont.

New Books, Catalogues, Etc.

The E. C. Atkins & Co., Inc., of Hamilton, Ont., have issued a revised price list as a supplement to their catalogue No. 18. This new list cancels all lists on pages 26 to 64, 77 to 85 and 93 to 95 in the above catalogue, and also cancels all former lists.

A new and revised edition of "Kiln Drying of Lumber," by H. D. Tieman, has just come to hand. This is the third edition of this valuable work on the artificial seasoning of lumber. The subject is covered in a very thorough and instructive manner and a vast amount of practical and technical information is given in a clear concise manner. The work is illustrated with over 50 engravings, together with a number of plates. The headings of the different chapters will probably give the best outline of the scope of this book; "The Structure and Properties of Wood;" "Common Practice in Drying;" "How Wood Dries; Shrinkage, Warping Case-hardening;" "The Principles of Kiln Drying;" "Circulation and Method of Piling;" "Special Problems in Drying;" "Improved Waterspray Dry Kiln;" "Drying by Superheated Steam;" "Theoretical Considerations and Calculations;" "Effect of Different Methods of Drying;" "Instruments Used in Dry Kiln Work;" "Temperatures and Humidities for Various Kinds of Lumber;" "Humidity Diagram."

The artificial seasoning of lumber is one of the most important operations in and around the woodworking plant, and the information contained in this book should be of real, practical value and application to every woodworker operating a dry kiln. This work is published by J. P. Lippincott Co., Philadelphia, Pa. Copies may be secured from the publishers of the "Canadian Woodworker." Price $5.00.

The 1920 year book of the National Association of Cost Accountants, which has just been published is an attractive volume which ought to prove of real value to all men interested in cost work. In addition to the reports of the various officers and committees and a list of the members of the Association, it contains a complete report of all papers delivered at the Annual Convention at Atlantic City, together with the discussions which followed each of these papers. This section contains a fund of practical cost information of a type which does not as a rule find its way into print. The Atlantic City Convention was probably the most important gathering of cost men which has been held in this country and the opinions of the men who took part in this conference are worthy of some study.

The Year Book is distributed to all members of the Association. We are informed by the Secretary that there are a few copies available for general distribution to men interested in cost questions. The offices of the Association are in Rooms 2546-2548 Woolworth Building, 233 Broadway, New York City.

FOR SALE

Planing mill on the Canadian National Railways, between Levis and Mont Joli, doing a Milling in Transit business, with work ahead guaranteed for several months at profitable prices. Fully equipped with Planer, Sticker, Resaw and Ripper, handli · several cars daily, with siding capac / of nine cars, right in the heart of lumber section of this Province, where more than ten times mill's capacity has been refused during the past year. Mill built of Cement with Cement Floor, Asbestos Roof, with additional buildings for Sash and Door factory or box factory, and sheds for piling dressed lumber, also with piling ground for about half a million feet of lumber. Price $30,000.00 on terms that will be satisfactory. A live man or group of men can easily clean up $2,000.00 per month net profit, and mill can be extended for increased business very easily. Principals only. If interested write to Box 106, Canadian Woodworker, Toronto, Ont. 1-3

Charring Posts of No Value

Service tests made by the U.S. Forest Products Laboratory on fences whose posts were charred at the lower end to prevent decay, in comparison with fences having untreated posts, showed that the charred posts were if anything less durable than the uncharred posts. It is concluded by the laboratory that charring is of little value in protecting the butts of fence posts and telephone poles from decay. One reason for the conclusion, apart from the test results, is that charring is unlikely to reach to the bottom of season checks and similar depressions in the surface of the wood.

Do You Know Me?

The Productimeter

I am the little machine that is always at the head of my class in accuracy, reliability, promptness, and deportment.

You attach me or one of my brothers to your moulders, matchers, stickers, self feed rip saw, or any other machine and I count or measure all the lumber going through. Then I tell you the exact amount so you can stop guessing at your production. I'll say I'm some boy.

Write my factory what machine you want me to check up on, and they'll send me to you on 30 days' trial. I have to make good or you can send me back.

Catalog No. 17 tells all about me.

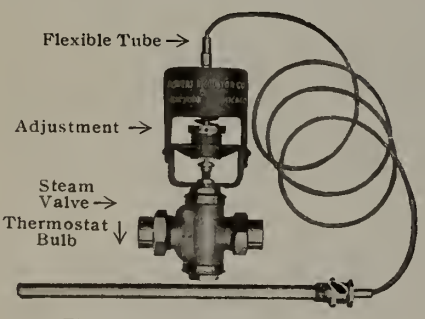
GARDEN CITY PLATING & MANUFACTURING CO.

Cor. Ogden Blvd. and Talman Ave., CHICAGO, ILL.



The Powers Regulator No. 11

Entirely self contained requiring no air or water pressure for operation. Automatic, reliable and accurate.

Peculiarly adapted to the control of liquid temperatures, in hot water tanks, glue kettles, acid baths, etc.

Other Powers Regulators for other uses. Write for Bulletin No. 129.

Standardize-Economize

A Powers Automatic Heat Regulator saves labor by mechanically controlling temperatures as required, thus relieving men for work which machines can't do.

It also positively prevents the ruin of **material** through **overheating** and **underheating**

The Powers Regulator never forgets—never procrastinates—never shirks. It controls the heat—keeps it where it should be—**all the time.**

It Standardizes Results

"Powers" uniformity in temperature insures uniformity in output. You can always be sure of right results—no frail mortal's memory or judgment need be trusted.

It Economizes

The "Powers" prevents waste and loss of material; saves the time of high priced workmen; enables them to turn out more and better work.

During our more than thirty years of experience in heat regulation we have gathered facts that are vital to any industry where heat treating processes are involved. Our knowledge is cheerfully at your service.

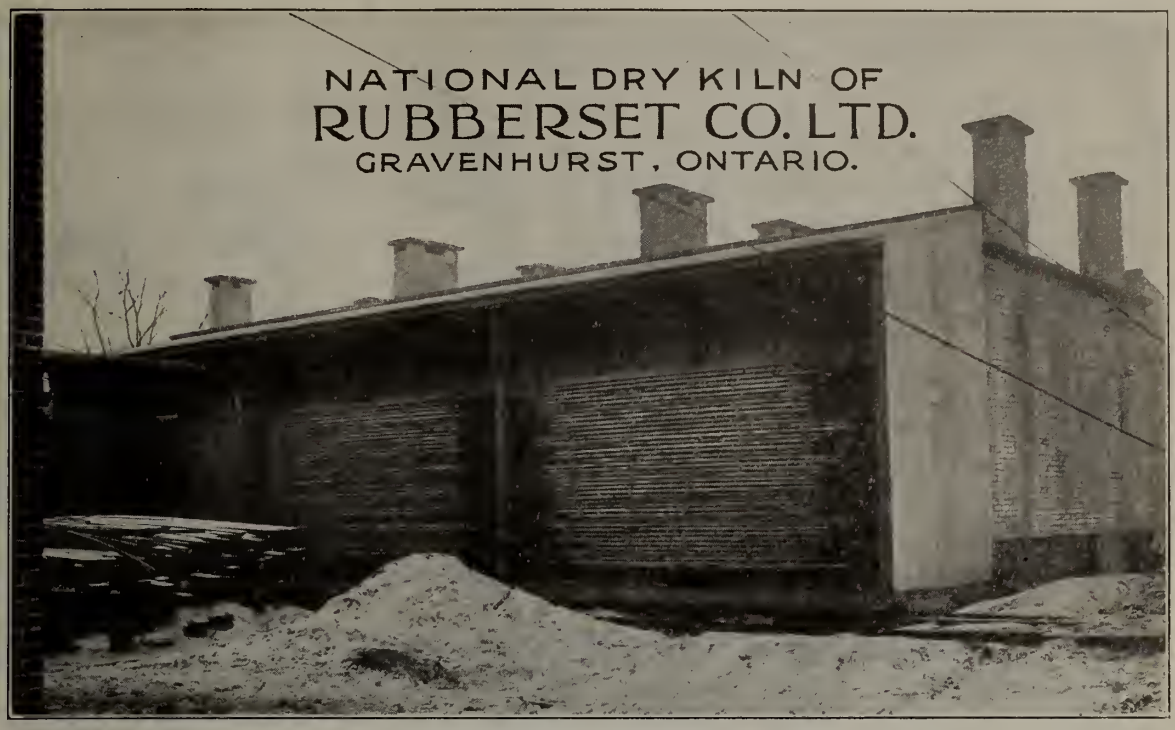
The Canadian Powers Regulator Co., Limited

Specialists in Automatic Heat Control

82 CHESTNUT STREET TORONTO, ONT.



Mr. McIntosh believed, during this kiln installation, that he did not need all that was being put on.

Mr. McIntosh's kiln is like an automobile with a self-starter and electric lights, as compared with one without.

THE ACTUAL USE OF AN ARTICLE IS THE PROOF.

We can build into your kiln just what is built into Mr. McIntosh's kilns that enabled him to write us on December 21, 1920, as shown herewith.

The National Dry Kiln Co.,
Indianapolis, Indiana.

Gentlemen:

It gives me great pleasure to inform you that our National Kilns are working perfectly in every particular.

As you know, our kilns are equipped with all your automatic control devices, such as the automatic water supply tanks, dry bulb thermostat, wet bulb thermostat, scalo meters, recording thermometers, door carriers, etc.

I thought, when installing the kiln, that some of the above were superfluous, but I can assure you that I would not think of doing without any one of them now. We have been operating our kilns for about two months, and find them to work better every day.

With the full information you give, along with the blue prints for installing, anyone who can read should have no trouble putting in the equipment.

We have just had all the pipes leading to the kiln covered with Johns-Manville insulating preparation, which we find is a great saving in heat.

I shall be pleased at any time to give you any information you may desire about our kilns.

Very truly yours,
Rubberset Company, Ltd.,
Gravenhurst, Ontario.
Per J. J. McIntosh,
Superintendent.

December 21, 1920.

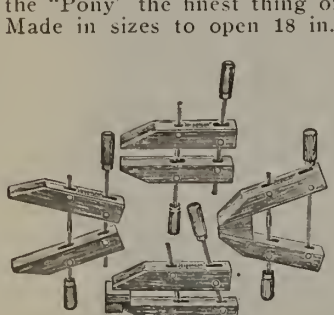
The National Dry Kiln Co., 1117 East Maryland Street, Indianapolis, Indiana

C. A. FIELDS, Canadian Representative, P.O. Box 55, TORONTO, Ont.

NATIONAL DRY KILNS

"Pony" Cabinet Clamp

For lightness combined with strength this clamp has no equal. All parts are selected from the best materials obtainable and we have spared no effort to make the "Pony" the finest thing of its kind on the market. Made in sizes to open 18 in. to 72 in.



"Jorgensen"

Peerless Adjustable Hand Clamp

Fits every grip without a slip and takes a tighter hold with less effort. It is a tool of real economy and a clamp that insures efficiency.

Empire All Steel Clamps Reduce Your Scrap Pile

There will be less trouble in your plant if Empire Clamps are used.

These unbreakable all steel clamps are proving their worth in many shops where the operators swear by them.

Try Empire and you will use no other.

We specialize in all types of woodworking tools.

Empire Tool Works

TORONTO

A Hundred Table Tops Now— Seventy-five Before

THE operator here, is a good man—a steady, hustling, careful workman, but he says the best he was able to get out of a garnet belt was seventy-five table tops. It wasn't his fault. It was clearly up to the belt.

A Carborundum Brand Garnet Belt is on his machine now and he is turning out 100 tops to the belt.

Proving once again that

A Clearing House for Practical Ideas and Mechanical Experience

Should trouble occur in your plant, don't look on it as something you must spend time and money to correct.

Perhaps some manufacturer in England has solved that problem—or it may have been in France, Switzerland, Japan, the United States, or right here at home.

Our engineers circle the industrial world. They bring to you knowledge gained in thousands of plants. Should some problem absolutely new arise, they have an industrial laboratory where it can be solved.

Consult this world wide organization without charges.

MORGAN
NAILING MACHINES

Are built strongly for heavy continuous service. Machines adapted to all kinds of special nailing.

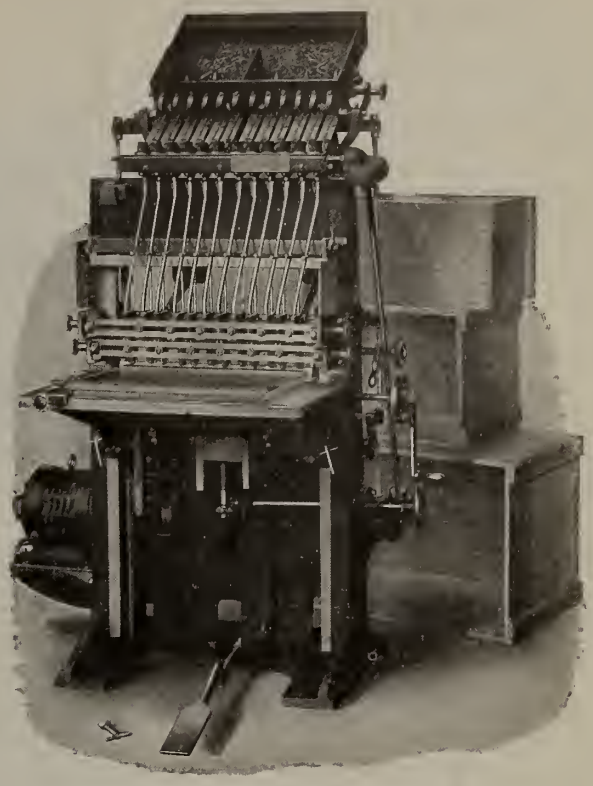
Regular machines for all sizes of boxes and crates.

Write us for descriptive literature.

Machines that save money

Morgan Machine Co.

DEPT. A ROCHESTER, N.Y.



Morgan No. 12-30 Open Back Nailing Machine, Fitted with motor.

You Can Use This to Advantage
The Olson Frame Extension

Increase the carrying capacity and therefore the usefullness of your Ford Truck by the addition of the Olson Frame Extension.

Particularly adaptable for the transportation of lumber and furniture for either short or long distances.

The perfect balance of the Olson makes smooth and easy running—a desirable feature when easily broken articles are being carried.

Our nearest branch will be pleased to send you fullest information.

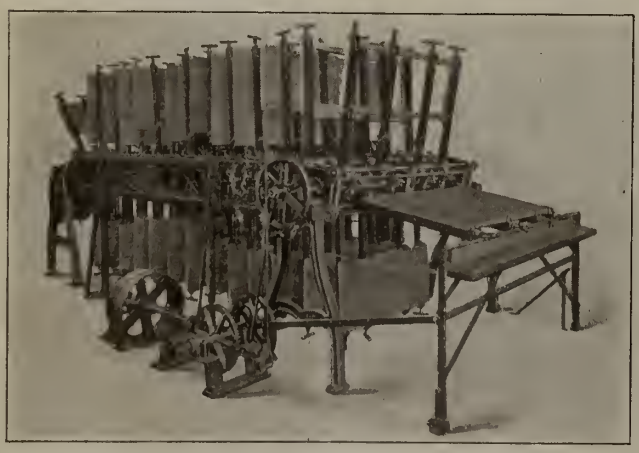
One Man Does the Work of Two
with a Billstrom Glue Clamp Carrier



For every plant where much edge-gluing is done there is a real need for a Billstrom.
Here's why:—

The empty clamp is held at just the right height for the greatest convenience of the workman.
When the clamp is filled he pulls a cord, which carries the filled clamp away and deposits an empty one in its place.
One man can accomplish as much by using it as two men can do employing the old methods.
It holds the work off the floor until the glue has set, when the glued stock can be quickly removed and piled flat, thus greatly conserving space.
It reduces the labor and cost of edge gluing to the minimum.
There is a sizs to suit your particular requirements.

N. J. BILLSTROM
2002 NINTH ST. ROCKFORD, ILL.

44 Yates No. 275
36 and 66-in. Automatic
Knife Grinders,
Brand New, at
One-half Price

Machines arranged for Motor Application as per cut, or regular belt drive, if wanted.

We have in Cincinnati, available at once, three Whitney 30-in. single surfacers and two Whitney 30-in. double surfacers, all with sectional rolls; three double arbor revolving saw tables; three single arbor tilting table saw benches; F.&E. single-end tenoner with roller table, and a few other choice machines. All are in exceptionally fine condition—are doing precision work at the present time.

7 New Hermance Molders, 8, 10 and 12-in., Stationary and slip-on heads.
8 New Andrew Multiple Vertical Borers, 20, 30, 42 and 60-in., any number of heads.

Band saws, 32, 36 and 38-in.
Borer, Andrew, 10-ft., 13-spindle, power table.
Borers, Andrew mult. vert., 20, 42 and 60-in., new.
Door clamp, Fay-Egan, heavy.
Door clamp, Jenkins-Hayes power-feed.
Edgers, two, three and four saws.
Glue cookers and retainers.
Jointers, 8, 12, 16, 20, 24 and 30-in.
Lathes, speed, eight, mounted on iron bed.
Lathes, turning automatic, Mattison No. 8 Yates No. 72, practically new.
Matcher, American Northwest, 24x8-in., 3 sides.
Matcher, 24x6-in., 3 and 4 sides.
Molders, 4-side, 9, 10 and 12-in. American.
Molder, Fay & Egan, 12-in. outside, heavy.
Mortiser, chain saw, New Britain No. 7, new.
Mortisers, F. & E. vertical, hollow-chisel; also plunger type; Greenlee vertical, double hollow-chisel.
Nailers, two, Hayes, 8-track, 8d, closed back.
Nailing machines, 2 closed back, 4-track, 4d, 15-in. spread, Hayes' make.
Pony planers, 16, 20 and 24-in.
Rip saws, self-feed, Hoosier, F. & E. Greenlee.
Rip saw, gang, Luther, for box work.
Router for stair stringers.
Sand belt, closet seat and similar work.
Sander, H. B. Smith, spindle and disc, practically new.
Sanders, 30- 42 and 54-in. Columbia; 30, 42 and 48-in. Invincible; 30 and 36-in. F. & E. double.
Saw, 8-ft. double cut-off, roller table.
Saws, combination and variety, single and double arbor, also tilting arbor, stationary and tilting table, 24 and 30-in. circular resaw.
Saw, circular re-slab, 40-in. blade, power feed rolls.
Shapers, Fay single-spindle reversible, also Shimer single with overhead routing attachment.
Shaper, Whitney No. 7 and 8 double-spindle, practically new.
Surfacer, 30-in. double, cabinet, B. & M., practically new.
Surfacer, Whitney 30-in. double, sectional roll and sectional chipbreaker; American No. 4½, 36-in. sectional and solid; Fay & Egan No. 140, 27 and 30-in. double divided rolls; also 18, 20, 24 and 30-in. single cylinder panel planers.
Tenoners, Fay & Egan double-end, also single-end.
Window frame machine for production work, new.
Window frame machines, Smith & Phillips combination.
Wood-worker, universal, Fay & Egan and Bentel & Margedant. One lot of glue room machinery.

We have just received two carloads of Band Saws and Jointers—all new—which are ready for immediate delivery.
Band Saws, 20, 26, 32, 36 and 38-in. Jointers, 8, 12, 16 and 24-in.

More *than* Economy *and* Speed

A Battery of "Automatics" at Stickley's, Grand Rapids

THE Mattison Automatic Shaping Lathe produces turnings much faster and cheaper than is possible with hand methods or with old style machine equipment.

BUT of even greater importance is its flexibility which gives your designer free play in creating his designs. It faithfully reproduces all the historic round, square and octagon turned work, which plays so important a part in the new, distinctive patterns of today.

MATTISON
Automatic
The Standard Shaping Lathe
OVER 3000 IN USE

If it is worth while to bring out new patterns, isn't it just as important to give equal consideration to the best and most economical method of producing those patterns?

CANADIAN WOODWORKER and Furniture Manufacturer

YOUR SALES

Increase with each Improvement in Quality

Your Profits Depend upon Speed of Production

The machine you buy for your edge shaping should have these desired attributes—**High Spindle Speed,** the kind that cuts cost of production.—**Freedom from Heating and Vibration,** the only means by which perfect edge shaping is attainable.

WHITNEY DOUBLE SPINDLE SHAPERS

have a regular working speed of 7,000 revolutions per minute, without tremor, vibration or heating, and mind you—they will keep up this speed continuously and produce the smoothest—cleanest kind of variety edge shaping.

Make inquiry of us, and let us convince you that the Whitney Shaper is the machine you want, to improve the quality of your product and boost sales.

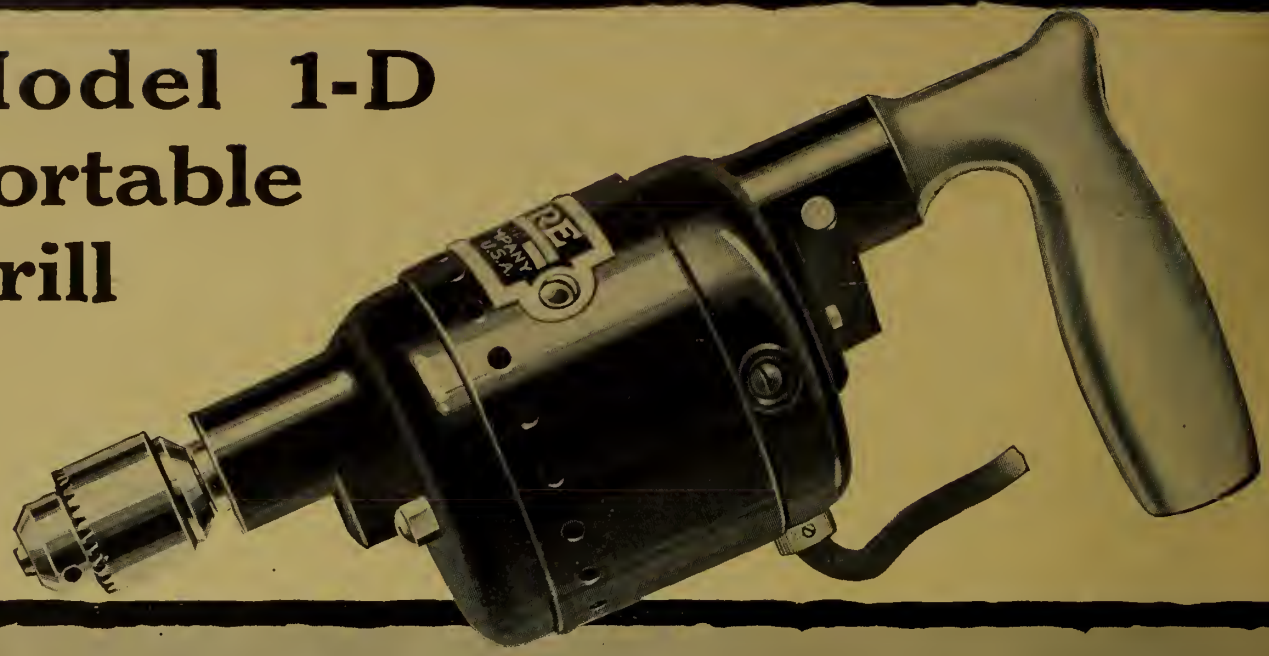
Model 1-D Portable Drill



HANDY—ECONOMICAL—EFFICIENT

Specifications:

Length—10 inches.

Weight—4¾ pounds.

Capacity—Steel, 0 to $\frac{3}{16}$". Wood and alloys, 0 to $\frac{1}{4}$".

Motor—Universal, on either direct or alternating current.

Diameter of Motor—3⅜ inches.

Spindle—Offset from center ¾".

Helical Gears.

Aluminum Handle.

Complete with 10-ft. cord, plug, switch and chuck.

Jacob's Chucks used as a regular equipment.

FOR speed in drilling and countersinking small holes, this tool is just what you need. It can be used on any kind of material—steel, iron, brass, aluminum or wood—and gives lasting service.

If your dealer cannot supply you with the Model 1-D, tell us about your requirements.

DUMORE GEARED ELECTRIC DRILLS

BUY THEM NOW

When Prices are Attractive

This is a special lot of second hand machinery we are offering for quick sale. Machines are all in stock in our warehouse, and every one is guaranteed in good working order. You can inspect them, or we will send full particulars on request.

1—McGregor-Gourlay Double Arbor Universal Saw Table, same as C.M.C. No. 618, with 14″ saws, self-contained countershaft, full complement of gauges, saws, wrenches, etc.

1—Ditto as above.

1—Preston No. 127 Variety Saw Table, countershaft attached, one 14″ saw.

1—Ballantine 36″ Band Saw, with solid lower wheel, complete with saw blades, wrenches, etc.

1—Ballantine Two Spindle Shaper, Spindles 20½″ centres, diameter of spindles where collars go on 1⅛″, top 42″ x 42″.

1—American No. 1 Single Spindle Shaper. Fig. 937 with plain countershaft.

1—C. M. C. No. 507 Mortiser, with boring attachment.

1—C.M.C. No. 624 Hand Feed Rip Saw Machine, with self-contained counter shaft, table 6'6″ long by 40″ wide, with plain box gauge, 22″ saw blades, 1¼″ arbor with cone for receiving saws different diameter.

1—Ballantine 8″ Four Sided Moulder, complete with square heads and straight knives on all heads.

1—American No. 2½ Single End Tenoner, with two copes and cut-off saw attachment. Fig. 9431 in American Woodworking Machinery Catalog.

1—Ballantine 16″ Buzz Planer with square cylinder, full set of knives and countershaft.

1—C.M.C. No. 646 Roller Table Cut-off Saw, sliding table 7'6″ long, stationary table 50″ to the saw, sliding table equipped with stop gauge, including five stops, with countershaft, complete with saws, wrenches , etc.

1—Yates No. 156 27″ by 6″ Single Surfacer with solid roll and chipbreaker, full set of knives, wrenches and countershaft.

1—Cowan Combination Vertical and Horizontal Boring Machine, complete with wrenches, etc.

1—Wood Frame Belt Sander, complete with roller table.

1—Hespeler 12″ Buzz Planer, fitted with round cylinder, full set of knives, countershaft, wrenches, guard, etc.

1—Ballantine Tilting Table Double Arbor Saw Table, same as C.M.C. No. 616, arbor raising and lowering, fitted with full set of gauges, countershaft, saws, etc.

1—Preston 36″ Band saw, lower web wheel and guards.

1—McGregor-Gourlay Variety Saw Table with countershaft attached, guard, gauges, tilting table, wrenches, etc.

8—Sections Cowan Four Screw Veneer Press 12″x50″, four sections 27″ clear space under screw plates, four sections 32″ under screw plates.

1—24″ Francis Double Roll Glue Spreader.

4—Sections Cowan Three Screw Veneer Press 38″x12″, 28″ clear space under screw plates.

1—American No. 4½ Single Surfacer, with solid roll and chipbreaker.

1—American No. 26, 10″ Outside Moulder, 4″ side heads, latest type machine, complete with knife jointers and all equipment, new straight knives on all four heads.

1—C.M.C. Arm Sander, No. 438, with paper cutter.

1—Universal Knife Grinder, 37″, made by American Wood Working Machinery Co., Fig. 1126 in their catalogue.

1—60″ Sturtevant Single Slow Speed Exhauster, left hand, top vertical discharge, complete with platform and rods to suspend from ceiling.

1—Pair 24″ Pulleys.

1—18″ Filing Vise.

1—Foley Band Saw Setter.

The last three items for use in sharpening small size Band Saws.

American No. 2½ Single End Tenoning Machine

A Sturdy Motor for Severe Service

Wound rotor type or slip ring induction motors are recommended for loads requiring very heavy starting torque or where gradual acceleration is necessary as well as for variable speed service.

Canadian Crocker-Wheeler wound rotor machines, like the squirrel cage type, are built mainly to meet severe service conditions. They embody the most modern electrical design and sturdy mechanical construction, with especially large bearings.

Our nearest House will give full technical data and recommendations on any of your motor requirements.

G-2 Will Do It. From the time stock is fed into the machine until the saw has completed the cut, it **must** follow an absolutely straight line. There is no alternative. The G-2 will rip anything from basswood to lignum-vitae straight and true as a die.

The G-2 is making good wherever installed. Why? Because they deliver the goods and keep on doing it. Manufacturers all over the country are using them. There are many features but the one that counts most is the absolutely straight cut secured under all conditions.

It would be worth your while to look into the possibilities of this machine whether you contemplate buying or not.

We have a circular which explains fully.
May we send you one?

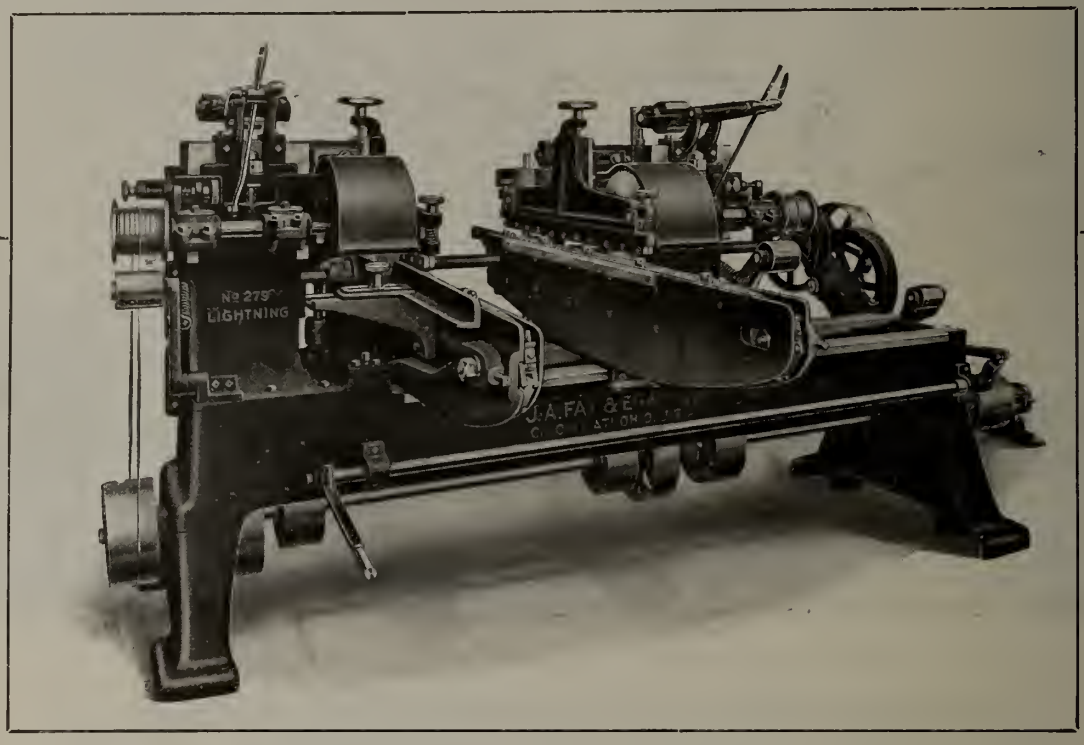
Control Your Manufacturing Costs

by installing a

No. 279 "Lightning" Double End Tenoner



There are many jobs now being worked on Shapers, Gainers, saws, etc., which could be done better and more cheaply on a No. 279.

No. 279 was designed for cutting tenons, coping and cutting off to exact dimensions both ends of material at one operation.

This machine is not only a modern fast-feed Tenoner—it is an up-to-date Automatic Double Cut-Off and Equalizing Saw as well.

As a Tenoner, it is distinctive in that it is entirely self-contained, all operating parts being driven from a single countershaft in base of the machine greatly economizing floor space.

Send for Special Bulletin 1-16 for full information about this wonderful and labor-saving machine.

J. A. Fay & Egan Company

ESTABLISHED 1830

World's Oldest and Largest Manufacturers of Woodworking Machinery

153-173 West Front Street, Cincinnati, Ohio

SIXTY YEARS

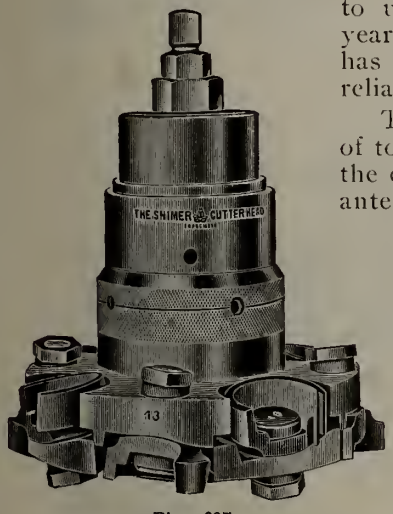


Fig. 627

The name "Shimer" has been quite familiar to users of woodworking machinery for sixty years. The reputation of Shimer Cutter Heads has withstood the severe test of time, and their reliability is unquestioned.

The cutter shown is turned to cut the shape of tongue and groove desired, so that to sharpen the cutter, it is filed or ground on its face, guaranteeing the user the same shape of cut during the life of the cutter. The cutter being fastened to a concave seat on a compound angle, assures the user of the proper clearance of cutters, consequently they never burn.

These heads are fitted with or without self-centering sleeve, and made expansion or solid, to suit the customer's wishes.

Write for Catalogue.

These are a few of the good points of the

Reynolds Magazine Fed Screw Driving Machine

Manufacturers who have been using the REYNOLDS are now wondering how they ever managed without it.

This is the machine that drives from 800 to 1200 screws per hour, and in certain classes of work as high as 2000 screws per hour have been driven.

A gross of screws (either wood or machine) is poured into the hopper and the machine does the rest.

Send us dimensions of your work and gauge length of screws and we will send complete description of machine for your needs.

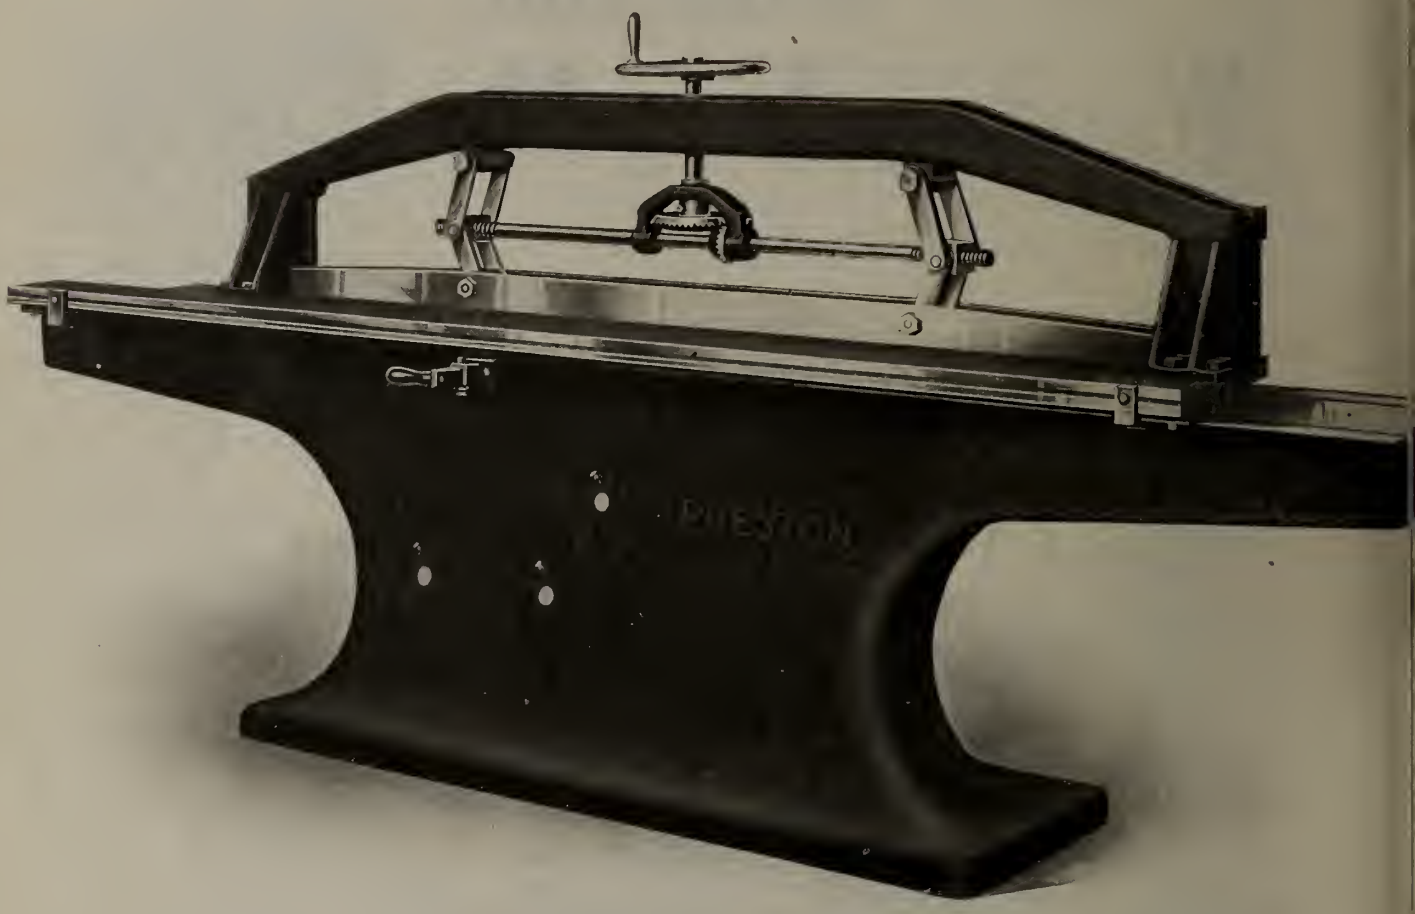
VENEER JOINTER

that will effectively joint buckled veneer



No. 181 "Preston" Veneer Jointer

THIS MACHINE was designed and built for the purpose of making commercially perfect face joints butt or crosswise as well as lengthwise of the grain on the highest figured circassian walnut or crotch mahogany veneer.

One of the most essential features of a machine of this kind is RIGIDITY. Examination of the frame or column on above illustration will show the massive construction of same which is of cored section and cast in one solid piece. This guarantees absolute accuracy in the table Vee ways at all times, thus contributing to a perfect joint being made on straight or curly stock at one operation.

Eaglesfield "BELTLESS" SWING SAW

Announcing——

A new design with special high-torque small-diameter

MOTOR DIRECT ON ARBOR

In addition to the present type of EAGLESFIELD BELTLESS SWING SAW, motor gear-connected, which was put on the market in 1919, we now announce a new design, with motor mounted directly on 2-in. spindle—gears entirely eliminated.

With ample power for saws up to 24-in., this new design permits a range of cutting from the small shop requirements up to heavy-duty service in car shops and saw mills.

Motor connection takes up only 3½ in. of saw, leaving ample clearance—as on a 24-in. saw, 8¼-in. cutting surface is available. Saw can be trammed for more accurate cutting than you have been accustomed to.

The unified hanger construction, resilient spring action, and the 7-in. section column are identical with the gear-head machine.

Motor is of the enclosed, built-in type, 25 or 60-cycle, 2 or 3 phase, any voltage. Extra large size S K F ball bearings. Saw up to 24-in. included in equipment.

Made in Canada

WE MAKE IT—and everything else in the Hardware line

WEBER-KNAPP CO., Jamestown, N.Y.

The Handiest Machine on the Market

Cross-cut, Mitre and Rip Saw Machine showing Split-Tilting Table and Boring Attachment.

The Split-tilting table (Patent Applied For) can be tilted and locked at any angle up to forty-five degrees as indicated on the graduated segment. This machine is also supplied with a solid table. The Boring Attachment is very complete in itself. A foot lever is connected with the table which slides back and forth on the knee. A large coil spring located in the column of the machine automatically releases the work from the bit when pressure is removed from the foot lever. The Boring Attachment is raised or lowered by means of a handwheel connected with a pair of mitre gears. The spindle is bored to take standard size bits and can be arranged for a hollow chisel mortiser. Special cutters may be used by removing the throat in the table. Each machine is furnished with one ten inch saw, belt and wrench.

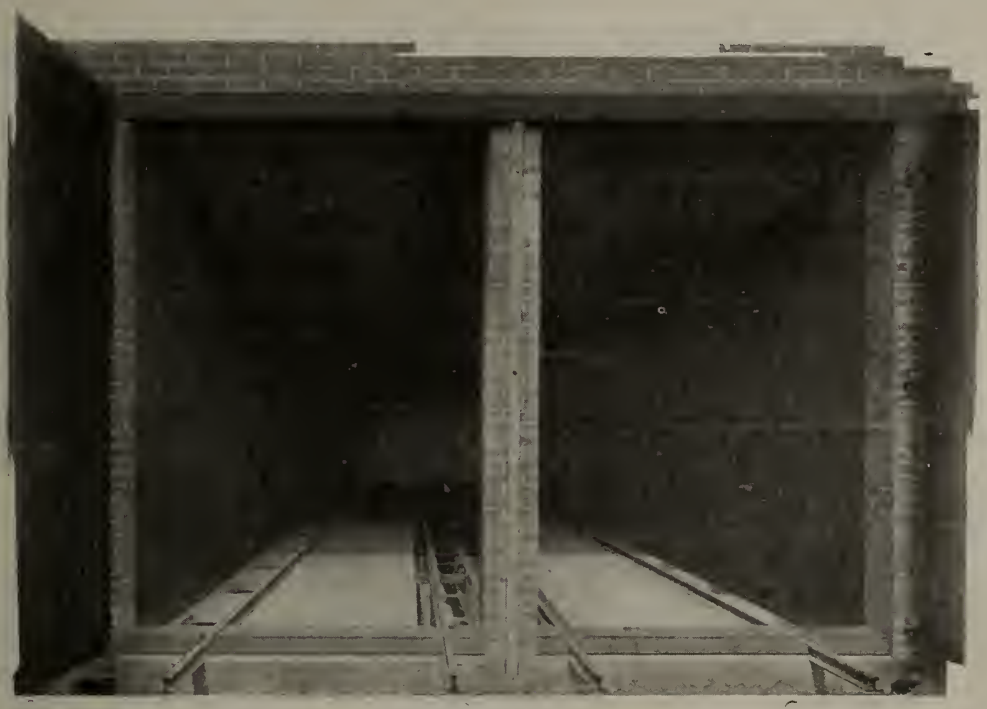
KILNS

New Principles of Lumber Drying



One Kiln Does the Work of Two

REAL ECONOMY

One Cutler Kiln does the work of two of any other make of equal size and does it better. This means that you buy but half the number of Cutler Kilns, save half the buildings, ground space, labor, handling equipment, cost of operation, supervision, and get a better quality of lumber. These are the facts which make the **Cutler System** so genuinely economical. These results are the direct effect of correct kiln design based on an accurate knowledge of the fundamental principles of drying lumber, on a thorough understanding of the mechanical features of all dry kilns and on nearly one hundred years of intensely practical experience in the drying of Lumber.

Art Fibre

Courtesy Kelton-Aurand Mfg. Co.

Good Fibre furniture sold at a reasonable price is what people are buying today.

Art-Fibre Cord and Art-Fibre Stakes enable manufacturers to produce such furniture economically.

That's why furniture made from Art-Fibre is becoming more and more popular.

Art-Fibre is made from stock especially adapted for taking stains and enamels, requiring the minimum of finishing materials. Its extra hard surface gives a perfectly smooth surface to enamels and varnishes and adds strength and rigidty to the finished article.

Cord, flat fibre and stiff stakes with or without wire centres come in either natural or brown color.

Unaflex Seaming Cord is unexcelled for upholstered furniture work. It is uniform, flexible and economical.

Write for Samples and Prices.

Perkins Vegetable Glue

PERKINS 183 was the FIRST VEGETABLE GLUE ever sold to high grade woodworking concerns and PERKINS 183 is now the last word to be said of a HIGH GRADE, UNIFORM QUALITY GLUE. Much money and effort have been spent on work covering a period of years; many changes were made in the formula until the present manufacturing process of 183 was reached and for fourteen years this glue has successfully filled the requirements of HIGH CLASS GLUE. Both our research and factory laboratories are constantly working to improve manufacturing methods and we shall never be satisfied to give the trade anything less than the best.

"St Joe"

Get the name fixed in your mind.

ST. JOSEPH IRON WORKS, St. Joseph, Michigan

Nine Good Reasons Why We Should Carry a Portion of Your Fire Insurance

1. Experts are created through specialization. Our underwriting is confined to lumbering operations and woodworking plants.
2. Our fieldmen are always at your service to assist you in bettering plant conditions and lowering your insurance cost.
3. We are spending more money in fire prevention work than any other insurance organization in the world, in proportion to volume of business.
4. Our inspections are an important feature of our superior service.
5. All risks must measure up to a high standard morally, physically and financially.
6. Our savings will reduce the cost of your insurance and will protect you from the excess cost of selfish competition.
7. The up-to-date successful business man believes in this form of insurance and we refer you to practically all of the large lumber operators in the United States and Canada, all of whom have our policies.
8. An insurance policy with us is more than an engraved certificate—it is a guarantee that both the spirit and the letter of our agreements will be complied with, and losses are always promptly and fairly adjusted.
9. We offer the last word in fire insurance indemnity, and the "proof of the pudding is in the eating."

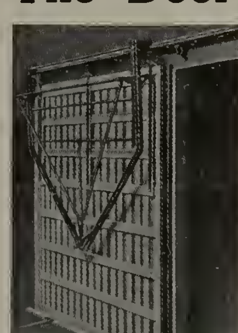
The Door Carrier System



Makes your dry-kiln doors steam-tight and saves time, heat, trouble and money.

Carrier lifts door clear of kiln and carries it down track. Returning, deposits door to rabbeted joint, where it is held steam-tight by its own weight. Applicable to old or new kilns.
Ask for catalogue.

ESTABLISHED 1867 INCORPORATED 1886

OTIS MAHOGANY

Brought from the inland recesses of the tropics, from the thick matted jungles where vivid flowers, and magnificent orchids grow in riotous profusion, where monkeys chatter incessantly, and birds of beautiful plumage dwell and strange creatures cry out in the night.

These piles represent the toil of natives of the jungle, and many miles of ocean travel to the land of the white man

Here you find

Tabasco, Laguna Honduras and Mexican Mahogany

The Otis Mills are always assured of an adequate supply. With a capacity of 12,000,000 feet per year, we are well prepared for any and all demands. Write for our prices to-day.

There is no doubt about a fundamental improvement in business conditions.

The volume of business in almost every line steadily increases, evidently reflecting the general feeling that we have reached a logical basis of relative normalcy upon which in ever increasing volume and with reasonable confidence transactions may take place.

While all the adjustments we may expect have not been made, undoubtedly the basic elements controlling supply, demand, production, costs, and sales prices, are in better balance, and no such violent fluctuations as have been registered in the past are to be reasonably expected. Certainly none of sufficient moment to discourage large activities are in prospect.

It is an encouraging outlook, which has not come as early as the most hopeful expected, but which has not been deferred as long as the pessimistic predicted.

It is a pleasure, as always, in this period of renewed activity to give to our patrons the scientific service and a maximum value, which it is ever our aim to secure to them.

Chas. T. McManus, 307 Brisbane Bldg., Buffalo, N.Y.

Are You Prepared For a Lumber Famine?

THE present situation among manufacturers, according to market reports, shows that Hardwood Stocks are far short of normal.

To those in close touch with the Lumber industry, there are positive signs pointing to a change in the lumber situation—values are bound to stiffen.

Prices are now at rock-bottom—this will not last. A sudden demand will shoot prices up again.

Just look over YOUR requirements for Birch, Basswood, Hard Maple, or Elm, now—and get quotations from us without delay.

Sawyer Goodman Company

Marinette - Wisconsin

Stimson Veneer and Lumber Co.

(Inc.)

Office and Mill: McLean Ave. and Union Belt R.R.

Memphis - Tenn.

We sell only the product of our own mills and make band sawn lumber in all Southern Hardwoods.

OUR MOTTO

REASONABLE PRICES – that you can afford to pay.
EFFICIENT SERVICE — that you have a right to expect
FAIR TREATMENT — that you can depend on getting

We would appreciate an opportunity of furnishing a portion of your lumber requirements.

Is it economical ?

Is it the right type ?

Is it the right size ?

THREE GUESSES

Electric power, heating, lighting and equipment problems are to be found in the woodworking industry.

Perhaps your output can be increased? You are, perhaps, losing electrical energy by wasteful types of motors? Are your switches and wiring devices up-to-date or are you in continual danger of fire?

We shall be pleased to answer any questions or help you with any problems whenever you care to write us.

Johnson Brothers Hardwood Co.

(OUR NAME IS EASY TO REMEMBER)

Bank of Commerce & Trust Building **MEMPHIS TENN., U.S.A.**

Lumber is selling today at less than the cost of production and any sane person knows that this condition cannot endure long. Prices must rise above their present level very shortly. It is the opinion generally that consumption now exceeds production and will likely continue to do so in even greater proportion for many months to come, even with the curtailed operation of the lumber consuming plants.

It would therefore seem a WISE policy to buy now against your future needs. Someone is going to pay more than present prices for their lumber, before long.

We are prepared to furnish all grades in all thicknesses 4/4" to 8/4", Cottonwood, Sap Gum, Red Gum, Red and White Oak, Ash, Tupelo, Soft Maple, Soft Elm, Sycamore and Willow.

"What Others Say"

"Your letter of February 15th received and we want to say that this was a very nice lot of lumber. It was good widths and lengths and well manufactured, dry stock and the grading was very liberal. We are sorry we cannot use more of this lumber at the present time. ***We received several cars from other manufacturers at a cheaper price but the lumber was not nearly as satisfactory.*** When we are in need of more stock we will take the matter up with you."

(Note—The above was sent us February 24, 1921 unsolicited. Name given on application).

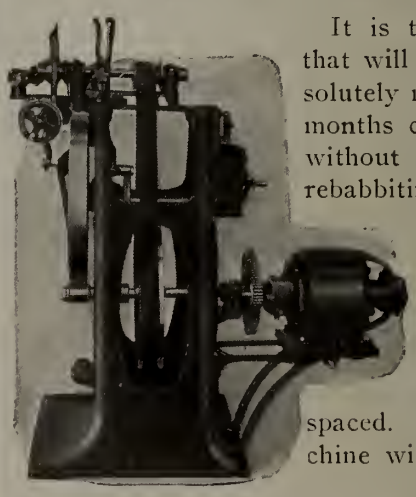
OUR EXPORT BRAND

The Berry Combination Band and Circular Automatic Saw Sharpener

Belt or Motor Driven. Capacity: Bands, 3-16" to 4", Circulars 4" to 32". Simple, Universal, Automatic in Action.

It is the only *combination* grinder that is *automatic*



It is the only grinder that will grind a saw absolutely round after three months continuous use—without readjustment or rebabbiting. It will take an unevenly spaced, hand-filed saw and make it perfectly round and even spaced. No other machine will do this.

For All Shops Using Circular or Band Saws

The Berry Tooth is far superior to the ordinary peg tooth. All teeth are alike, evenly spaced—ground right from the center. A saw ground with this machine does twice the work in half the time.

Write for Booklet to-day.

NATURE'S MAGNIFICENCE

"Great, wild and beautiful, beyond control,
She reigns in all the freedom of her soul;
Where none can check her bounty when she showers
O'er the gay wilderness her fruits and flowers;
O'er boundless plains she holds fiery flight,
In terrible magnificence of light,
At blazing noon persues the evening breeze,
Through the dim glow of realm-o'ershadowing trees."

The African Mahogany Tree grows in the heart of "Nature's Magnificence," six thousand miles away.

The Mengel Company has operated its own mahogany camps for many years; has selected and felled its own trees; has logged its own timber down the wild flood of the Tropical Rivers. ***And these operations are undertaken by no other manufacturer of mahogany veneer in the world.***

Vol. 21 Toronto, April, 1921 No. 4

Getting Back to Normal

One feature that tends for uncertainty and distrust is the discrepancy which exists between the values placed on their products by different manufacturers. There is a wide variation in the quotations and prices asked by various woodworkers. This holds true in the case of small orders as well as where large bills are figured. While there may be some excuse for a difference of a few hundred dollars in the figures asked for the woodwork for a house, something is radically wrong when the variation runs into the thousands or where there is a wide difference when the value of the work is small.

A case to point was brought to the attention of the "Canadian Woodworker" recently. Two of the largest woodworking concerns in Ontario were asked for figures on a small piece of work. One quoted $150.00 and the other named $280.00 as his best price, a difference of nearly 100 per cent. What hope is there of conditions in this industry becoming stabilized as long as there is such a lack of agreement as to values?

It is extremely difficult to explain why experienced estimators, practical men of long experience, who should know their work and know values, cannot agree as to the worth of some simple piece of work. The most likely explanation is that in this particular instance one figured the material on replacement value while the other based his price on the actual cost of the stock required.

This brings up an important point—one that is applicable to all branches of industry. In a time of depression and deflated values, such as that through which we are passing, is it advisable for a manufacturer to accept a loss, due to depreciated values, as quickly as possible and work up and dispose of his stock, basing his costs on replacement value, or is he justified in attempting to maintain prices at a level that will enable him to dispose of all accumulated stores of raw material at a figure which will, at least, return the money invested, when such a course tends to retard the return of normal conditions.

If there ever was a time when there was a chance of realizing on high-priced material, it would appear as if such a period has long since passed. It does not seem probable that material purchased when values were at their peak, can be turned at a figure based on actual cost. What governs the value of any article,—the price paid or general market conditions? The value of high-priced material in the hands of a manufacturer depreciated while in his possession. The loss has already taken place. Sooner or later the time will come when the loss must be accepted.

There is a bright side to the situation. Let us suppose a case. An order is accepted for goods at a price which shows a profit, figuring the material at replacement value. The stock to be used was purchased when prices were at their peak, so that it would appear as if a heavy loss was inevitable. The work is completed, delivered and the money received. Some of this money is used to replace the material which was worked up. The manufacturer now has the same stock as before and in addition is a few dollars ahead on the transaction. It would be futile to attempt to show that a profit was made for undoubtedly a loss has been accepted, but the point is that that manufacturer is in a far better position than if he had held up his price and lost the business.

It has been suggested by some, who have made a study of conditions, that the best way to get back to normal is to accept normal values and carry on as if normal conditions existed. This would entail a loss for the time being, but this loss could be carried in a special adjustment account and liquidated at a later date. The steps suggested for getting back to normal are in brief: Determine normal production, standardize the expense of doing business, determine fair standards of performance by the workers, determine quantity of goods which can be made, estimate cost of normal production, determine fair prices at normal profits, hold losses between standard and actual overhead for the year in a special adjustment account, take workers into your confidence, secure co-operation of bankers and plan a selling and advertising campaign. If everyone were to adopt such a policy—presto, business would be normal.

There has been a slight improvement in general conditions. The volume of business offering is not large, but it is slowly increasing. Let every woodworker do his part and bend every effort to assist rather than hinder the return to normal, healthy trade. There is such a thing as being too conservative, too economical. Let judgment and courage rule rather than fear and lack of confidence. Economy that avoids waste is always commendable and should be worked overtime under present conditions, but economy that throttles production, stifles demand and creates unemployment is unwise.

"Perfection" Objective in St. Therese Plant

Willis & Co., Limited, Demand Quality Rather Than Quantity — Organized for Efficient Operation—Production in Neighborhood of 4000 Pianos Annually

(By F. H. Devenish, of our Montreal Staff)

"PERFECTION" is the aim and motto of Willis & Co., Ltd., piano manufacturers, Montreal and Ste. Therese, Quebec. The plant at Ste. Therese is laid out and equipped with this end always in view, and the workmen are also instructed verbally and by printed notices, in English and French, to make this the only consideration in carrying out the various operations of manufacture. The office administration, too, is based on efficiency, the one object being to turn out instruments of a high grade, combining the best material and construction with a quality of tone which has no superior in Canadian made pianos.

Clamping up the key-boards in the cabinet making department.

The "House of Willis" needs no introduction to Canadians. It is one of the oldest and most respected organization in the piano business in the Dominion. The name is closely associated with the musical history of Canada, the firm having been purveyors to Royalty, the leading educational and religious institutions, and private families generally for over forty years.

Manufacturing Since 1877

This well known organization was founded in 1877, by Alexander Parker Willis, the president of the company. In its inception it was conducted on a very modest scale. About twenty years ago a factory was opened at St. Therese, Que. This was a wooden building and still remains as a part of the present plant. From time to time additions have been made, until today the plant has a capacity of 4,000 pianos per annum. The present factory, which consists of a basement and three storeys, gives a floor space 100,000 feet. Last year a new kiln and a varnish drying room were constructed, and it is proposed to build a kiln for drying veneers.

The plant has a unique situation, in that it is located on the two sides of a small stream, the power plant being on one side and the factory on the other. A concrete dam and sluice enables the flow of water to be regulated. Every precaution against fire is adopted. The factory is sprinkled, buckets filled with sand are placed on each floor, and a tank of 40,000 gallons capacity is erected on a steel frame outside the main building.

Modern Drying Equipment Installed

There is ample yard room for storing the lumber, which is air-dried from two to five years.. Stocks of mahogany, fir, balsam, birch, maple, elm, basswood, spruce, pine and walnut are piled in the yards, while generous supplies of mahogany, walnut ,oak, maple and birch veneers are stored in a large shed.

The new kiln is a very substantial structure of reinforced concrete on steel girders, and brick. It is in two sections, one for the one inch stock and the other for the two inch stock. At the receiving end there is a pit, with reinforced concrete pillars to carry the truck rails. The object of the pit is to collect the humidity in the first stage of drying, the water laden air being drawn off by flues at the bottom of the pit. After being dried, the lumber is cooled off in a cool-

Action setting and regulating. Note treadle on boring machine.

Sound board and bellying department. On right, attaching ribs to sounding boards by means of "go-bars."

ing chamber. There are loading and unloading platforms at the ends of the kiln. Economy is always considered, and the kiln is heated by exhaust steam from the power plant.

In the basement the packing cases are made from tongued and grooved spruce. The boxes are lined with sheathing paper. The glueing of walnut butt veneers is also conducted on this floor, it being necessary to do this work in a comparatively humid atmosphere, as the veneers have a tendency to crack in a hot, dry place.

Favor Aluminum Cauls

The lumber after being dried is taken to the machine department, on the first floor, as required. Here it is cut and ripped to length, and also inspected for defects. It is also planed to gauge for thickness. The machines used for machining the core stock, falls, trusses, toe-blocks, etc., are those of the Canada Machinery Corporation, of Galt, Ont. From the machine shop the stock is conveyed to the adjoining glueing department. Here the cores are built up. These cores are of birch, with cross-bands of birch veneer, and then, as a rule, mahogany face veneer, making a five-ply material. The glueing is done by a Francis spreader, which covers both sides of the veneers simultaneously, and makes an even spread of the glue. Aluminum cauls are placed between each panel. Aluminum is used because it is light, easily handled, retains heat, and presents a smooth, polished surface, upon which the glue does not adhere and which produces veneered work with a smooth, even surface. In the case of curved stock, zinc cauls are employed. The cauls are allowed to gradually cool, as if the panels were subject to chill the glue would lose its strength. The veneered stock is stored for two months in a very spacious section on the same floor, precaution being taken to see that it is properly piled, thus keeping these pieces in perfect condition. These are taken out as required and cut to size.

A corner in the machine room. Floors are scrupulously clean and stock kept in orderly piles.

The cabinet-making room is on the next floor. It is a very large department, the benches being arranged under each window so as to give the maximum amount of light. A certain amount of veneering is done here, the edge veneers being put on the stock. In addition, others parts are prepared, the sanding being done on Lucas and Fisher belt sanders.

The rast or back is one of the most important parts of a piano, in that it has to bear a considerable share in taking the great strain incidental to tuning. After it has been glued the back is cut to dimensions by a machine specially built for Willis & Co., Limited. This is a horizontal table, on which the back is placed, the planing down to dimensions being done by a rotary saw. The wrest plank and pin block and sounding are then fitted. The wrest plank is built up of ¼ inch selected quartered rock maple, cross-banded on a core of rock maple. The sounding board is of spruce, and is built of strips running in a diagonal direction. When glued together in the rough, the board is ½ inch thick, but it is planed and sand papered down to a finished thickness of from a ¼ inch in the bass end to ⅜ inch at the treble end. The bridges and ribs of the sounding board are glued on before it is fitted to the rast.

The bridges are made of thin strips of maple glued together. This is known as laminated construction and gives them great strength. They are bored for the bridge pins prior to being fitted. The sounding board, ribs and bridges are prepared in the bellying department. The sounding board receives a coat of varnish before it is attached to the rast.

The next operation is the fitting on of the plate or iron frame, which has

Gluing stock, showing Francis spreader and heater. Part of hot box showing on extreme right.

been previously bronzed. The pins are then driven in, after which the strings are attached.

Mechanical Equipment in Finishing Room

From the cabinet shop, the parts are sent "in the white" to the top floor, where the finishing department is situated. The stains are made up in a special room, the company believing that they get better results by manufacturing their own stains. The cases receive, in addition to the stain and filler, five or six coats of varnish. The first coats of varnish are applied by DeVilbiss spraying machines, and the final coats are flowed on by hand. The under coats are dried in a kiln, the walls of which are of double thickness. After this process the pieces are seasoned, and then go to the Maddox rubbing machines, finally being hand rubbed. The oak cases are fumed and waxed, the light pieces being given a coat of oil to give them a dark appearance. All the various parts which are varnished and polished are transferred on roller racks, thus eliminating all risk of damage, and facilitating handling.

The final touches are given in the side glueing department, where the pianos are transferred after the strings and keys have been fitted. In this department the instrument is set up, the pedals and the pedals straps put on, the castors fitted, and the action and keyboard adjusted. The piano receives several tunings and chippings, as well as action regulating and special fine tone regulating. It then gets another polishing, and after being fitted with the hardware parts it is again fine tuned and fine regulated by experts and is ready for the market.

Mechanical and Power Installations

The following is a list of the machinery used:—Sticker, two pony planers, swing cut cross saw, three 16" buzz planers, dowell machine, rip and cross cut saw, two band saws, shaper, two boring machines, turning lathe, drum sander, manufactured by McGregor, Gourley Co. Ltd., Galt, Ont.; self feed rip saw, self feed buzz planer, band saw, boring machine and belt sander, manufactured by the Canada Machinery Corporation, Galt, Ont.; rip and cross cut saw, manufactured by the Beach Manufacturing Co., Montrose, Pa., U.S.A.; belt sander, manufactured by the Fisher Sander Co., Kitchener, Ont.; two rubbing machines, manufactured by the Maddox Machine Co., Jamestown, N.Y., U.S.A.; three varnish sprayers, manufactured by the DeVilbiss Mfg. Co., Toledo, Ohio, U.S.A.; and glue heaters and glue spreaders, by the Chas. E. Francis Co., Rushville, Ind., U.S.A.

Rubbing by hand and with Maddox automatic rubbers.

In addition to this the company use veneer presses, clamps and forms for rasts, special cut-off saw for backs, and kilns manufactured by themselves. The glue is supplied by F. Canac Marquis, Quebec City.

The equipment in the power plant consists of two boilers, by Leonard & Sons, London, Ont., and two fire pumps, connected with the tank, a 175 h.p. engine of the Jerome Wheelock type, supplied by Goldie &

Varnish being applied with DeVilbiss equipment. Note varnish drying kiln and movable racks.

McCulloch, Galt, Ont., a compressor for the varnish spraying machine, are situated in the same building. From the power house the steam is conveyed overhead in a covered box across the stream to the factory, and used, in addition to heating the buildings, for various purposes, such as heating the glue, caul boxes, varnishing, etc., etc. All the condensation returns go to the boilers, thus economizing on steam. Grease and steam separators are installed.

Capable and Efficient Management

The factory offices are on the first floor, and are exceptionally spacious and well equipped. The stock room adjoins, this being so arranged that the stockkeeper is alone responsible for receiving and distributing the large amount of stock, such as hardware, fittings, glue, felts, etc., which is required. The head offices are in the Willis Building, an imposing eight-storey structure of Indiana limestone, 580 St. Catherine Street West, Montreal, and are under the management of Inglis Willis, the city sales manager.

The directors of the company are A. P. Willis, president, R. A. Willis, vice-president, C. D. Patterson, general manager, W. D. Willis, secretary, G. L. Duncan, treasurer, F. G. Sharpe, A. S. Benoit and A. Desjardins. The direct management of the factory devolves upon A. P. Willis, Jr., son of the president, who has been associated with the work of the factory for many years, from a practical as well as an official point of view. He makes his home at the factory, and has acquired a thorough knowledge of the men and of the French language. He is assisted by Joseph Colpron, as general superintendent, a man of thirty years practical piano experience.

Furniture vs. Washing Machines and Autos

Is Furniture to Give Way to Vacuum Cleaners and Washing Machines—Sales Methods Must be Revised—Widespread, Co-operative Advertising Offers Solution

By R. W. Wells

In this day of evolution and change, it is evident to the most casual observer of publicity that co-operative advertising by groups of industries is the order of the day. I share the opinion of some leading merchandisers that the next five or ten years will see this method the outstanding development in sales promotion.

A glance through any of the American magazines will reveal a number of co-operative advertising campaigns that are spreading the most effective sales promoting propaganda. This is particularly true of the industries that figure in the building of a house—the makers of hollow tile, face brick, limestone and common brick; otherwise the producers of cement, stucco board and interior woodwork, all set forth the merits of their respective products in a most convincing fashion. Nor do they stop at this. These various groups offer to the public (usually without charge) books of house plans, color schemes and, for a small fee, complete working blueprints and specifications.

Increased Sales the Result

The results of these publicity campaigns now in progress are most encouraging and could well be considered by the furniture manufacturers of Canada, who made such a promising "preliminary canter" last fall on the "track" of modern merchandising.

I have been in correspondence with the officers conducting many of the above-mentioned campaigns and this is a typical statement regarding results: "Our members are held together, there is a better tone in the industry, there is a marked development of progressiveness in our individual manufacturers, and the public is responding magnificently to our advertising suggestions. We are more than pleased and expect to continue our efforts indefinitely."

Furniture Not Considered

Let us consider these campaigns together with the individual campaigns of firms manufacturing linoleums, ready roofing, wall paper, paints and woodwork and the automobile to go with it all. Here we have national advertising, telling of a score of different ways to build and decorate a house. What about the furniture?

Few individual firms or any group of manufacturers are advancing the merits of any kind of furniture or suggesting furniture at all. It is forgotten in the plans for a house. True, a number of cabinet makers are offering to reproduce old masterpieces but no furniture advertising is making an appeal to the great majority of the people. Yet what merchandise is there (outside of the automobile) that has a greater appeal than furniture. Say "Furniture" to almost anybody and they are interested. Talk it to them and they listen.

Not Securing Its Just Share

Right now, the furniture industry of Canada is being robbed of its legitimate share of the public's money by the makers of washing machines, vacuum cleaners, automobiles, pianos, jewellery and a score of other manufacturers, who recognize the vital importance of national advertising and who go after business in an aggressive, not-to-be-denied manner.

Advertising has made the washing machine a necessity. It has made the vacuum cleaner a necessity. It has given jewellery the preference for gifts for all occasions. It is responsible for the rapid growth of the automobile industry. Yet this great and powerful servant, "advertising," lies waiting, in vain, for the Canadian furniture manufacturers to realize its value and permit it to increase their sales.

The furniture industry has a war to fight against competitive products—it must fight with advertising and must fight soon for its prosperity and development.

Fir Stump Roots for Furniture

One inventor at Victoria may solve the question of getting rid of the huge stumps on cut-over forest lands in B. C. He is laying before the department of industries his plans for putting up small portable sawmills to be sent to various places where the stumps are plentiful. The mills will cut them in slabs, bringing out the gnarled grain of the roots. These slabs he says take a fine polish and can be used for various purposes. The price for slabs with the best grain suitable for furniture, etc., runs to $6.00, and the inventor claims some stumps when sawn up will run to $18.00.

Engineering in Furniture Factories

Handling and Transporting Material—Figuring Power Requirement and Type of Prime Mover—Future Expansion of Plant Must be Considered

By B. A. Parks*

One of the most important problems confronting the furniture manufacturer is the receiving, handling, storing, drying, and transporting of the raw material, namely, lumber. Much thought and study should be placed on the arrangement of sidings, storage yards, dry kilns, cut-off saws, etc., as an efficient layout will pay for its development many times over in decreased labor and saving in time.

The lumber storage yard should be large enough to at least hold a year's supply in order that advantage may be taken of favorable market conditions and also to avoid delays in delivery due to transportation difficulties. The ideal storage yard should be equipped throughout with industrial trackage laid parallel with the receiving siding. This trackage system should be served by at least two transfer tracks running at right angles to the receiving siding. With this arrangement lumber is unloaded and sorted directly on small lumber trucks or "bunks" of the ordinary kind and then by means of the transfer tracks the truck loads, containing about 4000 ft., are placed in storage ready to be taken to the kilns for drying.

The type of kiln used will depend on the thickness and kind of stock to be used and also somewhat on the individual preference of the superintendent, but they should be so located in a battery as to be served by the same system of transfer tracks that serve the storage yard. A dry storage shed equipped with industrial trackage is also valuable as it allows for an accumulation of dry material and thus avoids delays in receiving lumber at the cut-off saws which might be occasioned by accidents to the kilns, stock spoiled in process of drying, or other delays between the kilns and the mill.

The same system of transfer tracks that serves the storage yard and kilns should be extended to the cut-off saws, where there should be provided hydraulic or screw lifts or elevators to raise the entire load of lumber and keep the top of the pile a few inches above the tops of the saw tables.

Cuts Down Hauling Costs

It will be seen that with the above arrangement the lumber is not handled from the time it leaves the railroad car until it is placed on the table of the cut-off saw, and the consequent decrease in handling costs is at once apparent. The arrangement of lumber storage yard, kilns and transfer track to cut-off saws is of course a problem for each individual case, and consequently only brief suggestions can be offered here which must be worked out by the engineer to suit each situation.

While receiving and handling of the lumber should probably receive the greatest consideration in laying out the transportation facilities to and from the plant, yet railroad sidings to the power plant, for the delivery of machinery and coal, and to the shipping room for shipping the finished product, should not be overlooked but should receive thoughtful study. It should be borne in mind that sidings to the lumber storage, power plant, and shipping room should have separate access to the main tracks, if possible, so that switching may be done on any siding without its being necessary to disturb the cars on any other.

Provision for Extending the Plant

Probably the most efficient and economical method of extending or enlarging a furniture plant is on the sectional plan, each new extension consisting of a more or less complete unit in itself. This method also creates the least amount of disturbance to the existing arrangment of any plan that might be devised. With this in mind the original plant, as described above, should have a service wing at one side in the center in which would be housed the toilet and locker rooms, as hereinafter described. This wing should be the same height as the manufacturing building and in addition to the toilet and locker rooms, should have a passageway which would give access from each floor of the original plant to the corresponding floor of the new unit. In other words, the new unit of a plant under enlargement should parallel the original unit at a distance of 40 to 50 ft., the two units being joined by the common service wing. The site should be so chosen and the original layout so made that extensions to lumber storage yard, dry kilns, sidings, etc., would be logical developments of the above plan.

The above sectional or unit plan of plant enlargement has another feature which may be valuable under certain situations in that with a series of multi-storied buildings, joined together as described, there are two possible methods of arranging separate departments or groups of departments which are closely allied. They may be separated either vertically or horizontally, in other words, one department or group of departments may use the several floors of one building or they may occupy the same floor in two or more buildings if this arrangement seems to be more satisfactory.

Generation and Transmission of Power, Light and Heat

On account of the large amount of refuse from most furniture factories, which is available for fuel, it follows without much argument that in, by far the majority of cases, it will pay to erect an isolated power plant, unless capital is limited or the plant be very small. The power plant of any industrial institution is deserving of the most careful thought and study on the part of the designing engineer. The almost uniform practice in the past, and in fact the too prevalent custom today, is to treat the power plant as sort of a necessary evil and install the cheapest equipment that money can buy. The only excuse for such a procedure is the fact that most furniture factories supply the large part of the fuel from waste and consequently the owners feel that it is not economy to purchase good efficient machinery. With the increasing cost of coal, however,, this excuse, if it may rightly be termed so, is disappearing and a well-designed plant for the production of light, heat and power is coming to be recognized as decidedly a paying investment.

The first decision to be made in starting the power plant design is the method of transmitting power to

*Second installment of address before American Society of Mechanical Engineers.

the various machines in the factory. In by far the majority of cases, the most efficient method of transmitting power from the prime mover to the principal machines in small and medium-sized plants is by means of shafting, pulleys and belts. The principal machinery in a furniture factory is almost always in one department, the mill or machine room, and consequently the larger portion of the machinery can be driven by belts from one, or at most two, lines of shafting. Electric individual or group driving of machinery is unquestionably the best and most economical where machinery is widely scattered, or where some of the machinery is operated only part time, but where most of the machinery may be arranged in one department and the majority of it is operated at all times, the initial expense and overall efficiency of driving from line shafting take precedence over the electric drive.

Placing the Lineshaft

The location of the main lineshaft will depend on the arrangement of the machine room or rooms. Where practically all machinery can be located on the main floor an excellent design is obtained by incorporating a low basement in the building and placing the main line shaft or shafts on concrete piers in this space. By using wedge and lateral-adjustment bearings the shafting can be maintained in perfect alignment and many of the breakdowns incident to poorly supported shafting will be avoided. This arrangement has the additional advantange of removing all overhead shafting from the machine room, the individual drives to machines coming up through the floor, and it also admits of easy access to all bearings, pulleys, and belts without the use of ladders, thus materially assisting in proper attention being given to maintenance. Where it is necessary to use ladders or scaffolding to make repairs to shafting and equipment, it is but human nature to neglect this work until it becomes unavoidable, consequently any arrangement which will make such repairs and adjustments easy will be found profitable.

Electric Drive Advantageous

If due to the arrangement and location of machinery it is necessary to place machine rooms on two floors, the most logical position for lineshafting is on the ceiling of the lower floor, for this permits of driving machinery on both floors from the same lineshafting. In this case additional headroom should be allowed on the lower floor, 13 to 14 ft. in the clear being usually sufficient. Provision should also be made in the design of the building for supporting the main lineshafting, the joists being increased in size to not only carry the additional load but also to provide a structure as rigid and as free from vibration as possible. A good method of designing the floor structure of the building is to place the main girders or beams longitudinally and the joists transversely, about 4 ft. apart. Every other joist may then be increased in size to carry the lineshafting drop hangers. This arrangement of joists also has the advantage that when cutting holes for belt ways through the floor it will be unnecessary to cut the joists and thus weaken the floor structure. The only objection to this arrangement of girders and joists is that it throws the floor loads into the curtain walls between pilasters and thus necessitates heavier lintels over window and door openings than would be the case with girders running transversely and joists longitudinally, as is the usual practice.

In large plants with widely distributed machine rooms, or where there are several isolated machines to be driven, the electric individual or group drive is practically the only means of transmitting power efficiently and economically. In some plants a combination of lineshaft and electric drive may prove advantageous, but each plant is a problem in itself, the decision being made upon proper consideration of the various factors involved and no general rules can be laid down to govern such decision. In driving woodworking machinery electrically it will generally be found the best plan to arrange the machinery for driving purposes in groups, all of each group operating for about the same period of each day. In this way the initial expense for motors is kept to a minimum and also each motor driving a group of machines is kept more uniformly loaded to near its rating. Where certain machines are operated but intermittently or require a comparatively large amount of power for driving, then the individual motor drive will undoubtedly be found the most satisfactory and economical.

Upon deciding on the method of transmitting power to the various machines the next step will be to select the proper type and capacity of prime mover. The capacity may be determined by taking a total of the power required to operate each machine, as furnished by the manufacturers, assuming that there will be periods during which all machinery will be in operation. This total will give the "connected load," making no allowance for power lost in transmission.

Figuring Load Factor

The load factor in most furniture plants will average from 75 to 80 per cent of the connected load. An estimate must then be made of the power consumed by power-transmission equipment, consisting of shafting and belts or electric drives, and by adding the connected load, corrected for load factor, plus an allowance for mechanical efficiency of the prime mover, the indicated horsepower capacity required to furnish the plant with power may be determined. The electric load and lineshaft load should, of course, be kept separate in order to terminate the generating capacity required, also the electric lighting should be laid out and proper allowance be made both in the generator and prime mover. Unless it is expected that extensions to the plant will be made in a short time, the engine should be so chosen that it will deliver the required indicated horsepower when loaded to about 75 per cent of its rating. This will allow a fair margin of growth of the plant before an additional power unit is required, and at the same time the engine will be operating under an economical load from the beginning. Having determined the capacity the type of prime mover must next be decided upon, and if part of the machinery is to be driven from lineshafting, then the choice will be with some type of reciprocating engine.

In all but the very largest woodworking plants the demand for low-pressure steam for heating and drying purposes forms such a considerable portion of the exhaust steam available from the engine and the waste from the plant makes up such a large part of the full supply that it is uneconomical to operate condensing, at least during the larger part of the year. As the space in this paper is not sufficiently large to discuss all the factors effecting a decision to operate condensing at all periods of the year, it will be assumed that we are treating of the small or medium-

sized plant where it is seldom if ever found economical to operate condensing, at least during the heating season.

Keeping Down Power Bill

The low-pressure steam requirements for dry kilns, heating, etc., should be determined and a curve drawn showing the average demand for low-pressure steam throughout the year. It is apparent that the largest demand will be during the winter months at the height of the heating season and will gradually taper off to a minimum during the summer months. Assuming a steam consumption of 26 or 27 lb. of steam per indicated horsepower per hour for the ordinary Corliss type of engine and that 85 per cent of the exhaust will be available for heating and drying purposes, a curve should next be drawn showing the average available exhaust steam for the various months of the year, and upon comparing the two curves it will be seen at a glance during which periods of the year the heating and drying demands exceed the exhaust from the engine, or vice versa.

In most furniture plants the exhaust from the engine will exceed the requirement for low-pressure steam during the summer time and it therefore becomes a question as to how valuable this excess of exhaust steam is and how great an investment is warranted in cutting it down to the minimum. From a knowledge of the total steam requirements of the plant the amount of fuel required can be calculated, assuming that 20 to 25 per cent. of the lumber cut finds its way to the boiler room as refuse or waste, and that the fuel value of the wood is about 20 per cent of that of the average bituminous coal, weight for weight. It is then a simple calculation to determine the cost of evaporating the excess of exhaust steam during such periods of the year as this excess exists. Any saving effected by reducing the amount of the excess exhaust steam, which would go to waste, should not only pay all fixed charges on any investment made to reduce this excess but should also pay a return of at least 20 per cent per year on this additional investment. As briefly outlined above, then, it is fairly easy for the designing engineer to determine how economical an engine it will pay to install and whether it would be profitable to operate condensing, say, during the summer months, or to install other means of utilizing or reducing the excess of exhaust steam, thus effecting a saving in the coal pile. The type of engine best suited for driving a lineshaft load where efficiency, economy and continuous operation are permanent considerations is probably the slow or medium-speed releasing-gear simple Corliss engine or the poppet-valve engine, which latter is similar in most respects to the Corliss except in the valve gear.

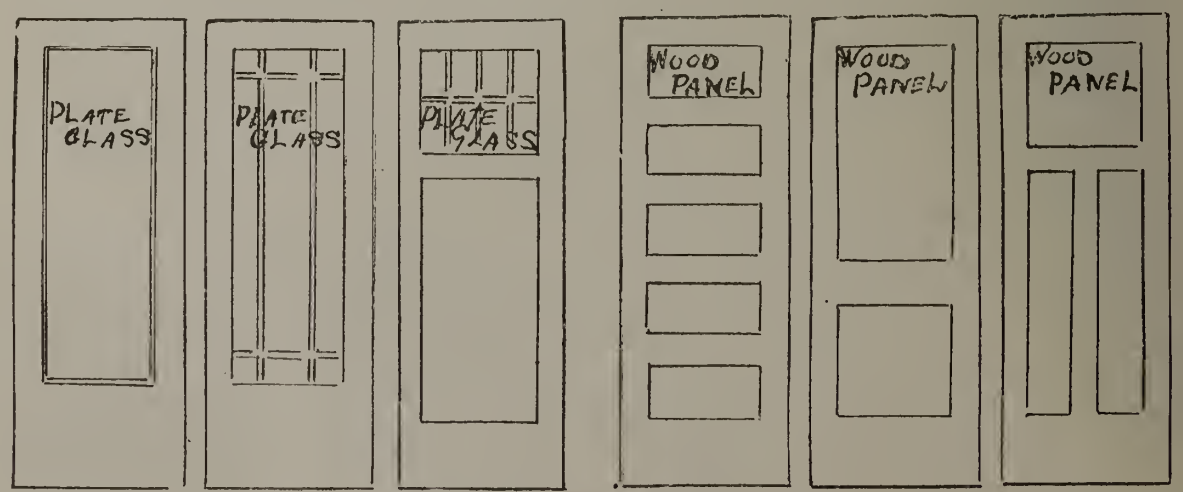
Is Demand for Small Houses on Increase?

Highly Trained Designers Specializing on Small Homes—Millmen Should be in Position to Satisfy Requirements of Clients—Woodwork Adds Charm and Attractiveness to Home

By W. H. Shaw

In the future our dollars will have to be really earned. The era of national and individual extravagance would appear to be over. The wealth in circulation during the last few years has been out of proportion to the wealth produced by this country. The problem now is to more nearly equalize these two factors. There must be expansion and this must be in staple lines. There is always money for necessaries, and until this field is served absolutely, diversions and luxuries will have to wait their turn. The links of business are so joined that the first slackening in the purchase of motor vehicles really was an indication of the physical fact that we had just about come to the end of our era of extravagant spending.

Should we own a home before an automobile? It is a curious commentary on the times that while people maintain that they cannot afford to build homes, or even to buy them—unless that is the only feasible way to keep a roof over their heads—yet many seemingly can afford to buy and to pay the running expenses of an automobile. Building costs, compared with prices of a few years ago, are high, but so are automobiles, especially in first cost, and the price of gasoline and the cost of everything to keep them run-



Types of inside and outside doors.

ning is constantly advancing. The purchase of an automobile is only the beginning or first cost and the depreciation in value is rapid. The money put into a home is an investment. Piece by piece, the situation in the matter of automobiles and of home building parallel each other both as to the cost and the difficulties that stand in the way. The normal life of a well-built home, which receives a little care and attention from time to time, is twenty-five to forty years at the least and may be a hundred. Its investment value does not lower at least for ten years, but what is a $3,000 automobile worth after five years' service?

Should Place Home First

In the final analysis it comes back to what a man chooses. Many cannot buy both an automobile and build a home. One must have a place in which to live. How long will the sober judgment of the people allow them to rent a two or three-roomed apartment in which to sleep and eat, while they buy an automobile in which they expect to live. It is the psychology of the times which has allowed the mind to be so perverted. In the meantime the large proportion of the building which has and is being done, comes either in the class of apartment houses, or apartment hotels, or some type of garage, or automobile equipment. Such buildings have repaid the investment with satisfactory interest. People continue to pay higher and higher rents and they also continue to buy automobiles—but, apparently, the change is now upon us.

It is very improbable that rents will come back to so-called normal, even after the walled-up stream of building begins to flow again. When people have lived huddled in small apartments for a time they will have learned many things, both as to increased convenience and inconvenience, all of which will help in planning the new small home in demand to-day. Never before has so much thought been expended on the small home by highly trained designers. The wise man will have his plans made ready so that he can start his building as soon as he sees his way to do it.

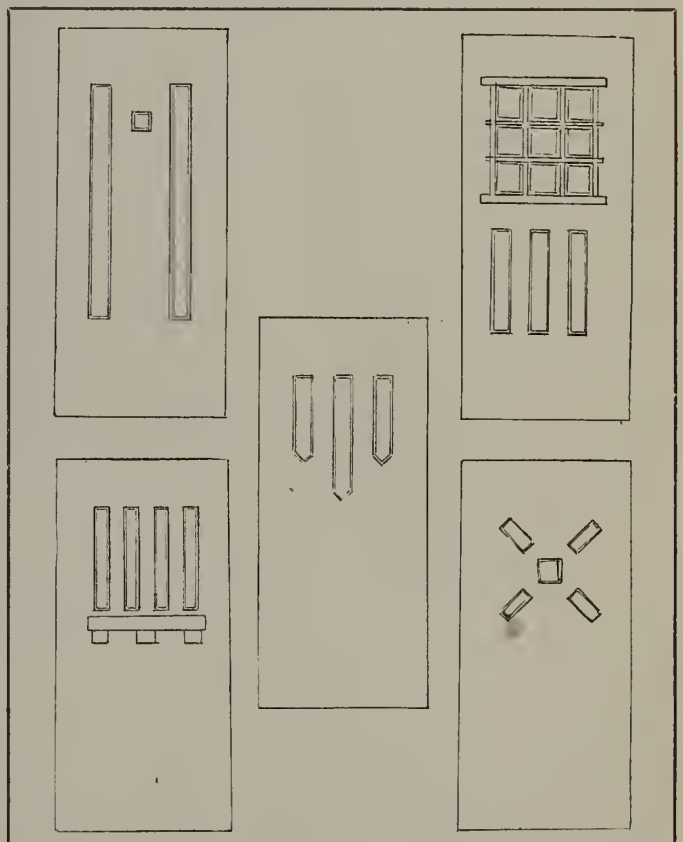
Requires Careful Consideration

When the cost of building can be approximately estimated in terms of the cubic foot of contents under the roof, one may realize what an important element is the size of the building, area and height taken together. Next to size comes the matter of simplicity, of construction. Every additional corner or unusual angle in the construction of a home means additional labor for the workman; the cutting of material, especially lumber, which usually means that small pieces are wasted and the general slowing down of the work until the unusual parts are out of the way.

One of the most important features of the real attractive, well-designed house is the trim or woodwork, as it is familiarly called. Carefully selected woodwork combines the three essentials,—comfort, beauty and utility—and lends a warmth and feeling of life to the home. Outside it is the finishing touch in the form of an inviting porch, door or attractive window. Inside it is the door with its becoming panels, the mantel, bookcase, built-in sideboard, breakfast nook, window seats or stairways. To the builder it is one of the most important features of his construction programme and for that reason is of considerable consequence. Upon it depends much of the satisfaction of his client. Likewise it is important to the millman, who is continually consulted by people in his community who are planning new homes. The choice of millwork is left to him in many cases, and he can make the proper selection if he is acquainted with the details of the material. The days of "soft selling" are over and the sooner the millwork industry realizes this fact and gets on a modern, post-war basis, the more rapidly will come the prosperity with which it is bound to be blessed.

Door Important Feature

Great strides have been made in the standardization of millwork during the last few years; and now most millmen carry a certain stock line on hand at all times, so that there will be little delay when the order is placed with him. Of this type of material exterior doors are, perhaps, as important as any other item.



Suggestions for attractive outside doors.

Attractive doors are largely instrumental in making attractive homes. Invariably, the first favorable impression gained by visitors is due to the distinctive doors which are everywhere so evident. Two essentials of a good door are strength and design. These doors can be manufactured in a variety of designs; as some of the cuts show. There is the all-wood door with its variety of panels, and the wood door with its different kinds of glass panels. There is the French door with its expensive glass front and a great many others too numerous to mention. Slab doors are very popular because of their distinctive appearance and their sanitary construction, there being no horizontal surfaces to collect dust. In connection with the front doors, especially in Colonial houses and Colonial bungalows, the sidelights are manufactured in a variety of attractive designs.

Interior doors are important because they form a large part of a harmonious picture. They are in a sense furniture, and should be selected accordingly. Colonnades are another feature of interior trim that demands the careful consideration of the builder who is seeking to make his handiwork as attractive as pos-

sible. They, like doors and windows, are furnished ready to set up by the millman and are made in a variety of designs.

"Build Now," Slogan of Woodworkers

Mr. Millman, are you talking spring business with your clients now? Why wait until it is too late? Perhaps never in the history of our country have the people as a whole been as interested in the building proposition as they are to-day. What class of small house will be built in your locality or in the country at large? Psychologists assert that there is very little hard, cold judgment in the world. Most people are ruled to a large extent by their feelings. Most people buy or build a certain class of house because a certain type appeals to their reason, because the arrangement of its plan is logical, or because it will give comfort or pleasure to some loved one. A type or design of house of late years which has appealed to young people on account of its charm and older people on its convenience, is the bungalow. With the demand still for small houses, city, town, country and summer home, many will without a doubt continue to build this class of home.

So much discussion has developed over the term "bungalow," its definition and origin, and just what a genuine bungalow may be, that the term has lost its first great significance. Its first lustre has been somewhat dimmed and the issue befogged by the quibble over terms, though the ideal which the term represented has not only remained clear but has developed more definitely, and has now taken its place in the hearts of this nation of home lovers, even more secure than in its early popularity.

Why Bungalow is Attractive

The term "bungalow" at its best, to express it in very modern language, stood for efficiency; conservation of effort, in its saving of steps and labor-saving devices; economical first cost, through building only what the family really needed, without making provision for entertaining, convenience — through the thoughtful use of the latest and best ideas in labor-saving equipment, a positive sense of brightness and of life inside the house, plenty of air, and a pervading sense of cheer, and with all that charm which belongs to the sense of personality at home in its own surroundings.

All of these desired things may belong to the small home, irrespective of its general plan or type. Whether it is all built on one floor or whether it is two full storeys in height is not an essential point. There will be, doubtless, a thousand small houses built for every large house. While many of these large country homes and city mansions are very beautiful, yet in a broad sense the beauty and charm of the country at large depends far more on the character of the small house than the beauty of the large homes. The great streets of palaces on one side cannot counterbalance the slums on the other side.

Sectional Bookcases

A firm in Durban, S.A., dealing in furniture and office equipment, would like to get in touch with Canadian manufacturers of sectional bookcases. Inquiry 2812.

In the States efforts are being made to standardize doors and window openings and the frames that surround them.

Conditions in Woodworking Industry

The anticipated improvement in general business has not materialized. It was confidently expected by many that April 1st would see a definite turn in the tide of events and that from then on there would be a marked increase in demand with a general resumption of business.

In the furniture industry the demand showed an improvement during the first part of March, orders coming in freely; during the latter part it eased off considerably. In spite of that, the unfilled orders on hand at the beginning of April showed an increase o 5% over those on the books of the different furniture manufacturers on March 1st.

Lumber, glass, hardware and other materials required by the furniture industry are still on the downward grade. Glass is probably in the lead, as showing the greatest decline, with lumber a close second. The weighted commody figure representing all materials used in the manufacture of furniture has declined to 244.7, a drop of 100 points. This must not be taken to mean that there has been a reduction of 25% in furniture manufacturing costs as wages have been cut very little and freights and overhead remain at very high figures; in fact as the volume of business is below normal, the proportion of overhead expenses shows a considerable increase. Practically all furniture factories are operating though at reduced capacity. Business is very spotty, some plants being busy one week and nearly idle the next. Those manufacturers who brought out new designs in medium-grade lines are meeting with fair success.

In the sash, door and millwork field business is very erratic. The woodworkers in certain towns find a strong demand while in the neighboring municipalities business is very slack. In the Maritime Provinces the woodworking plants at Amherst, Truro, Moncton, Fredericton and St. John were busy during March while those at Sydney, Halifax and Charlottetown were quiet. Conditions are better in Quebec; in fact, this is the only province reporting a larger volume of contracts awarded during the first three months of 1921 than in the corresponding period of 1921, the figures being $14,250,000 for January, February and March, 1921, as against $13,914,000 for the same months of 1920. With the exception of Quebec, the woodworking plants in the various centres enjoyed a fair volume of business. The same holds true of Ontario. Many of the plants are working full time while others are operating at reduced capacity. In Toronto there seems to be a marked improvement in the demand for millwork of all kinds, practically all the planing mill men reporting a gratifying increase in the volume of business offering. On the Coast conditions seem to be fairly quiet, the reports received indicating that the woodworking industry in British Columbia is experiencing a period of marked inactivity.

Figures recently issued by the MacLean Building Reports, Limited, covering the first three months of 1921 show that the total value of residential contracts awarded during this period to be $8,763,600, as compared with $8,869,200 for the corresponding period of last year. This shows a decline of some $75,000. For business building, that would include stores, warehouses and other structures of a similar nature, the figures are $17,902,500 for 1921, as against $18,702,300 for the first three months of 1920.

Train Foremen to be Better Managers

Greater Efficiency Demand of To-day—Eliminate Waste by Remedying Cause—Foreman in Ideal Position to Function as Efficiency Engineer

By P. L. Burkhard*

If the company is to reduce its production costs it calls for greater efficiency than ever before. This is not the time to let up. It is the time to buck up. If unit costs are to be decreased in the factory, wastes must be cut out. It should be evident from this that foremen can no longer take the attitude that "it doesn't matter." It does matter. Prices are high to-day partly because of industrial waste and partly because of inflation. The banks can take care of inflation—they are now slowly forcing deflation—and index prices show that already there is some drop. We must take care of the industrial wastes ourselves, because that is the biggest part of our job. What are we going to do about it?

The elements of industrial activity which may be either utilized or wasted are (1) man's time and energy, (2) machine and equipment time and energy, and (3) materials. These three elements sum up the industry itself. When a worker does four hours' work in eight hours, or expends his energy through unnecessary operations or in some useless manner, a waste may be charged against him. It is likely that if a worker is wasting part of his day he is also wasting the time and energy of more or less equipment. A machine not operating or running idle is generally a waste which is unnecessary. Of materials too much cannot be said. We may grant that every shop has its scrap, cut-offs and rejects, but who knows how little scrap is actually warranted? The foreman who wishes to function as an efficiency engineer in his own department should strive to reduce the quantity of scrap to its minimum. The importance of this is also reflected in the quality of the product which passes inspection. He should strive to get the most out of the machines, tools and equipment in his department. He should strive to win the co-operation of the men in his department so that they will utilize their time productively. This does not mean that he should attempt to speed them up, but rather show them how to accomplish more with the same amount of effort and energy. It is well directed energy which brings the greatest results. Mis-spent energy wears a man out more quickly than energy which produces output.

There are two serious obstacles which confront the foreman who makes up his mind to eliminate the wastes which exist in his own department. The first is his viewpoint. When a man has been on a job for a number of years, no matter how good he is, he just naturally gets into a rut. He cannot see conditions in their true light. He loses his sense of values. Most men can go into another man's department and see what the trouble is. Unless they are trained by experience in efficiency work they won't see all the trouble, but they will see enough to venture an opinion as to what the other fellow should do. But when it comes to a man's own job! He gets so close to his own problems that he cannot see them. It is particularly hard for a department head to see the wastes of his own department in their true proportion. To overcome this the foreman must get a bird's-eye view of his job. Me must get far away from it to see it as it is. He must realize that simply because he does a thing in his own way that it is not necessarily right. He must be able to analyze and weigh the facts. In other words, he must get the viewpoint of the industrial engineer.

The second obstacle that the foreman meets is that effects loom up larger than causes. The system under which he broke into his trade, from apprenticeship to an executive position, has been one which places stress upon effects and forgets causes. The reason for this is that manufacturing has not been scientific in any sense. Factories just grew as the proverbial Topsy. There was no undertaking of that type of management which to-day may be called scientific. The best we can say about it was that it was rule-of-thumb from start to finish. Causes for industrial wastes were unthought of, the wastes themselves were not seen. The rule-of-thumb manager and his foreman thought they were working efficiently when they remedied effects. I can best illustrate this by mentioning that at one time rule-of-thumb physicians relieved patients having a high blood pressure by bleeding them. To-day the more scientific physician prescribes a diet. In other words, to-day he is getting down to causes. In the same manner the foreman who undertakes to reduce or eliminate industrial wastes must get down to causes.

The causes of industrial waste may be traced to one or more of the following reasons: (1) Lack of a well defined purpose, (2) absence of essential data, (3) non-standardization either of product, conditions, operations, instructions, (4) planning too vague and general, (5) lack of control, (6) inadequate incentives, and (7) lack of co-operation. From these causes we may deduct the principles which govern business and industrial efficiency. The principles are basic and adherence to them will remove the cause which may be permitting waste in one form or another in the plant.

Failure to move material may be due to lack of planning. Backtracking may be due to non-standardization. Operators may be producing sub-normally due to the lack of planning, data or more probably lack of adequate incentives. In any case, if we get down to causes we are in a position to get a more effective productivity.

Therefore, if the foreman is to function as the efficiency engineer in his own department, he must train himself to get the right point of view, the viewpoint of the industrial engineer; he must learn to concern himself with causes and not effects. Then he will be in a position to locate industrial wastes which are common to all industries and which occur in his own department. As he gets a working knowledge of the principles which govern effective production he will become keen in his ability to measure the wastes which occur, ascertain the cause, and correct the condition, by striking directly at the heart of the trouble. He will then verify my statement that after all it is the foreman who is the logical efficiency engineer.

Can You Make Perspective Drawing?

Ability to Make Sketches Valuable Asset for Foreman and Superintendent—Simple Method Outlined

By S. E. S.

The ability to make oneself understood in giving out orders in a plant, is a quality that few foremen possess. In the following article, the writer will endeavor to offer and explain a method, which, if adopted will aid greatly, not alone in time, but will help your men to see in their minds' eye an article as you see it yourself. The practicability of rough sketches in giving out work has long been practised, but to be able to make a projection in the perspective, is truly worth while.

It is a fact, that a good many workmen are not able to read mechanical or architectural drawings, when made separately in plan, elevation and section. This is especially true of small details and objects which have to be considered as a whole. It is vastly quicker for the detailer to make an offhand perspective of the object and mark the dimensions, than to make the usual three drawings. If it is necessary to explain the work in hand, it can be better understood from the projection anyway. As the underlying principles of perspective drawing are not understood by many men, who have a natural ability for offhand work, and as they are quite simple for this elementary work, I will endeavor to set forth enough of them to enable the foreman or draftsman to make such drawings, as are shown in this article.

Perspective Defined

In the first place let us not get perspective mixed with isometric drawings, which are also employed in the same sense, but which are used more for patterns and intricate machine parts. In the isometric drawings, the opposite lines are parallel, and this gives the impression that the object pictured is too large at the further end. To correct this, and give the eye the true idea of distance, the opposite lines of the perspective drawings, converge to a point somewhere beyond the object at which we are supposed to be looking. The points, at which the lines come together, are what we call "vanishing points."

Fig. 1 illustrates how this is done, and at the same time gives a haidy way of making perspective sketches with first-hand instruments. The straight edges and the manner of their use are illustrated. If a man should like to make perspective sketches, and has trouble getting his lines to run in the right directions, he may acquire the right hang of it by using the simple plan as set forth in Fig. 1. Then follow with ink or colored pencil if desired. The idea of the straight edges is to facilitate the speed with which the perspective drawings can be made by having them always hooked over the brads at the two vanishing points.

When making simple drawings for shopwork it is not necessary to use more than two points, and their location is mentioned further on. It will be noticed that the brad holes are in line with the edges of the ruler or straight edges, and this side should always be used for a guide in making the marks.

Outline of Method

Fig. 2 shows the method of finding the middle of centre of perspective plane. The projection from this centre may be made upward with a triangle or along the perspective line, as the case may be. Good judgment will often allow one to do this offhand when he knows where the lines should be drawn. It will be seen that the convergence of the lines toward a common point is the thing which gives the sense of proper size for any given distance, so we must locate our vanishing points in such relation to the body of the drawing that the required parts to be shown will not be covered in developing the drawing. It is well also not to overdo the matter, as has happened in figures 3 and 5.

While not technically correct, it is common practice to make all the vertical lines perpendicular to a base taken from a T square. If such is shown on the top of a figure, it will cause the bottom to show rather wide, as is seen in Figs. 3 and 5. A good comparison is shown in Figs. 3 and 4, in which the legs are vertical throughout. In Fig. 3, the legs seem to spread at the bottom, while in Fig. 4 the discrepancy is hardly noticeable. The latter shows comparatively little of the top, yet enough to receive the dimension marks, while in Fig. 3 so much of the top is shown as to entirely conceal one leg.

Details May Be Included

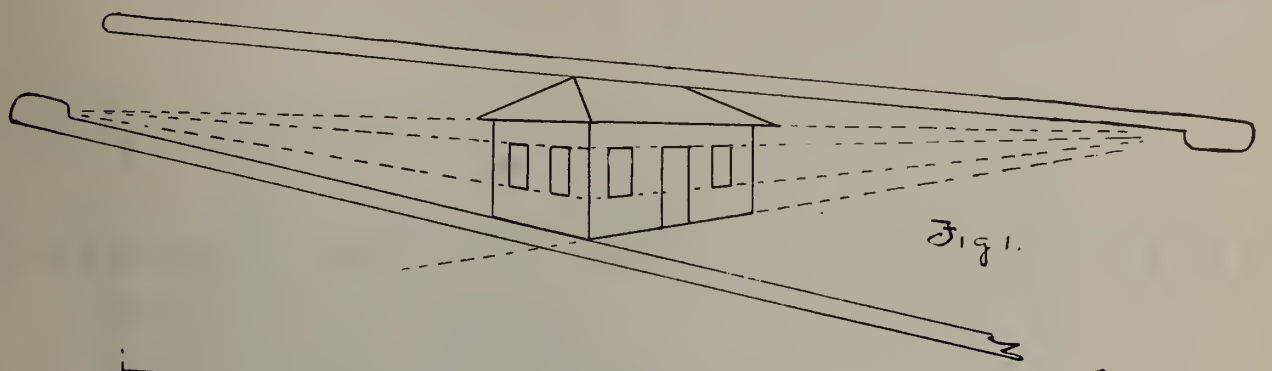
Detailed sketches like Fig. 6 may accompany a sketch of the table, showing how the apron is mitred at the corner of the leg. Such details as these serve as reminders of the method to be followed. If the job contains anything which might be new to the workman, it should be explained by word of mouth and the drawings and details gone over carefully once or twice to be sure he has caught the right idea and is able to successfully carry out the work, without spoiling stock.

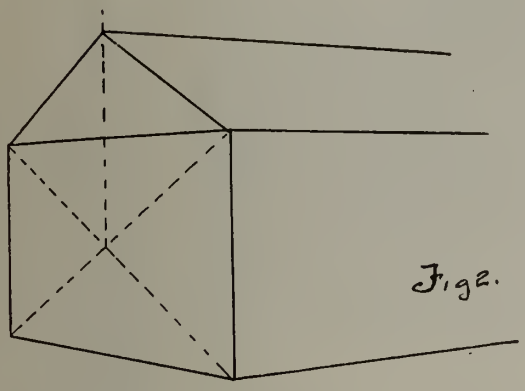
Fig. 7 shows a common wood box. This sketch with a bill of stock is all a workman should require to complete the job. Fig. 5 is a chest of drawers and needs only the marking of the dimensions and a stock bill in order to have the work go forward to completion. In this connection most factories have an established set of methods or fixed ways of assembling or doing things in the way of cabinet work, so that when a sketch is handed to a workman he is only interested in the dimensions. The details of construction will be taken care of by him.

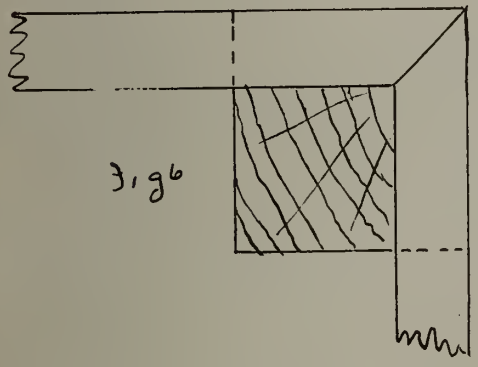
It will be understood that the cutting bills for these pieces will furnish such information as does not appear on the sketch, or, perhaps, turn it around. The drawing should furnish the information not to be found on the cutting bill. The two, taken together, should tell how to complete the work. Then again, if the information cannot be grasped by the workman, he should be instructed in an easier style of drawings, so that when he comes to such difficult ones as architects' details or details of cabinet work, he will have a better idea how to go about his work.

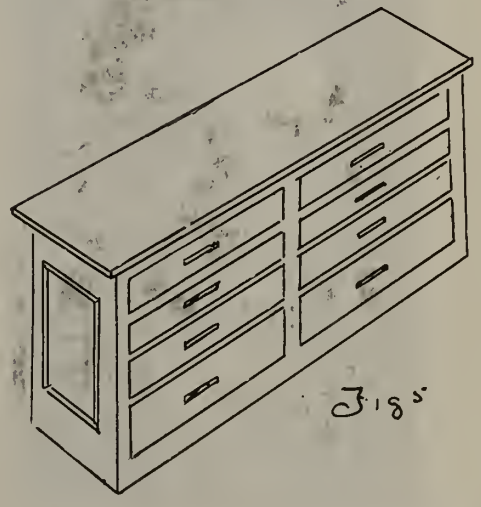
Determining Height and Length

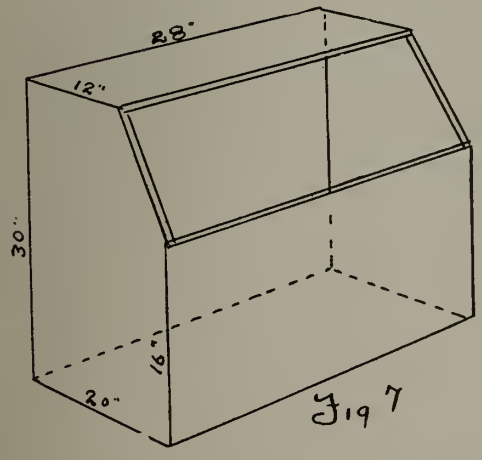
It is not necessary to make these sketches even as good as they are in this article, and these are rough enough. All the offhand sketches used in the shop are

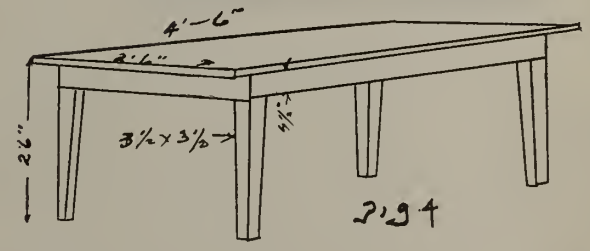












Suggestions for making perspective sketches.

usually made with a pencil and one need not be so careful at the intersection of the lines as a line made too long can be easily erased.

The hardest part for the beginner is to make the up and down lines look right, more especially on longer sketches. This is true where he is compelled to start them away from the angle or intersection of the top, as in case of the table legs. A good way to locate these lines is to draw a light line on the top of the table as far as the projection of the top is to be, and all the way round. The corners of the legs will drop from the corner of the line and so give the beginner a start in locating the legs in right place. The length of the legs or extreme height of any perspective is found by drawing a light line from the bottom of the nearest leg and to each vanishing point, then bringing the two legs down to them. The farther leg is located by the intersection of two lines each running from the farther leg to the vanishing point, as shown in Fig. IV.

The one thing to remember in this work is that it is but a means to an end and is not of great importance as to the quality of the drawings so long as they serve to convey to the minds of the workman what is meant by the bills.

Architectural Service Builds Goodwill

Planing Mill Operator Considers This Valuable Department—Results in Many Nice Orders—Pays to Go After Business Aggressively

The McKinney Lumber Co. has developed from a small beginning into a go-ahead, fair-sized industry and while it does a large retail lumber business, it has found that the contracting end is an active element. "In fact," declared Mr. McKinney, in conclusion, "it is the life of our business. To it there is no limit, and if one is alive at all times, there is no need to be idle."

"We find a great boom to our business in our architectural department. We make our own designs and believe we secure a lot of business by this means

A. J. McKinney, McKinney Lumber Co. Woodstock, Ont.

that otherwise would slip away from us," said A. J. McKinney. As an instance of what such a service and department gain, Mr. McKinney says that he met a farmer on the street a few days ago, who asked him what it would cost to build a cottage 26 ft. x 30 ft., four rooms—two bedrooms, a dining room and a kitchen. Mr. McKinney inquired when he would be going home and received the reply "about 4 o'clock in the afternoon." He was then requested to call at the office before his departure. When the farmer drove up, Mr. McKinney says they had ready for him a neat little design with floor plan, elevations and complete specifications. The rural visitor was so surprised and delighted that the McKinney Lumber Co. got his business at once.

Another interesting illustration is furnished by the McKinney Lumber Co., who state that about a year ago a farmer was burned out at six o'clock in the morning. He drove into Woodstock and called at the lumber company's office early in the afternoon. A member of the firm went out that evening, and took the measurement of his foundation, which was not destroyed. The next afternoon the farmer, his wife and family and a friend who had just built a new house, came into town. "We took them," continued Mr. McKinney, "into our draughting room and with their help designed their new home, got their business the same afternoon and the next day the farmer was drawing material away for his new home. We find that this architectural department works well, not only with farmers but with school boards, church boards and, in fact, anyone who is building."

Mr. McKinney, whose yards and mill are located at the corner of Ingersoll Ave. and Riddell St., Woodstock, has had a long and practical experience with the lumber and construction line. His father was a framer and bridge builder. The subject of this reference went into the bush when 12 years old. Two years later, being left alone and the oldest of a family of four, he had to get his back to the wall and put up a hard fight. Arriving in Woodstock 22 years ago he worked as a carpenter and foreman for a local contractor until 1910, when he launched out in the contracting business on his own behalf.

In 1912, finding more capital necessary for the extension of his business, he took in a partner and organized The McKinney Lumber Co., Limited. The partnership lasted for one year when, by mutual consent, he bought out his partner's interest, still leaving the concern as a joint stock company. Business has kept increasing, and more enlargements were made to the plant until the last Sunday morning of 1919, when the entire mill and contents were destroyed by fire. Mr. McKinney and his associates had faith in the future of the business and turned their whole force the next morning to reconstruction. In two weeks' time they were able to move into the new planing mill building on the old site. This is a two-storey structure 60 ft. x 112 ft., fully equipped, together with a closed lumber shed, also two storeys high, 50 ft. x 80 ft. At present the company is building an addition 50 ft. x 60 ft. to their shed and a new office and storage building 50 ft. x 26 ft.

Organized for Maximum Production

Large Quebec Plant Employs Modern Methods—Bonus System Increases Output—Departments Maintained at Highest Efficiency—Interesting Description of Organization

The Brompton Lumber & Manufacturing Company, Bromptonville, P. Q., was organized in October, 1919, to take over the plant of the Tobin Manufacturing Co., which had been closed for several years. The factories have been completely overhauled and additions made, and a large amount of new equipment installed. The result of this reorganization was a large volume of business; about 14 million feet were dealt with during the last twelve months in one of the most up-to-date and largest woodworking plants in Eastern Canada.

Woodworking plant of the Brompton Lumber & Mfg. Co., Bromptonville, Que., showing one of a battery of kilns on left.

The plant is situated on the St. Francis River, five miles from the city of Sherbrooke, with Grand Trunk Railway sidings alongside the mills and right into the yards, which are divided into two sections, one for hardwoods and the other for softwoods. The plant consists of a planing mill and re-sawing equipment, with a capacity of over a million feet per month; a hardwood flooring mill, with a capacity of 200,000 ft. per month; a moulding mill; a sash and door and interior trim factory, with a capacity of 200 doors per day and 500 sashes; and a wholesale lumber department. Besides these, there is a sawmill at Stoke, seven miles from Bromptonville, and another sawmill at St. Francois Xavier, also seven miles from Bromptonville in another direction. The company, through Mr. E. W. Tobin, the president, have connections with several large sawmills in Eastern Canada, which he controls.

Efficiency Department Watches Production

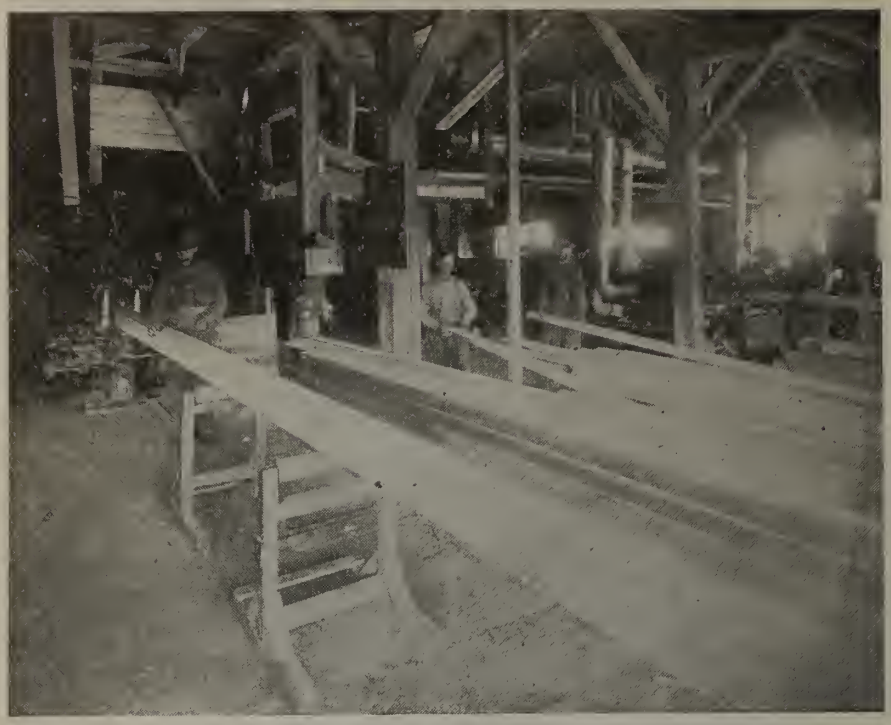
The entire plant is laid out on a systematic plan which has for its purpose the rapid despatch of orders and the maximum of efficiency in all departments and operations. In order to acquaint each department with its duties and the relation of the department to the other departments, the management has devised an "organization chart" which tells at a glance the definite duties of each; also the persons in charge, their position, their assistants, etc. The management is thus relieved of much detail work, and is always in direct touch with the working of the organization, since all heads report to a superintendent who, in his turn, confers with the management.

It is interesting to note that there is a department called the "Efficiency Department," which comes directly under the manager's supervision. Mr. Germain created this department early last spring, and states that he is pleased with the results obtained. As the name implies, this department is for the sole purpose of recording productions of departments and machines, to watch for leakages, wastes, etc., and to apply proper remedies. The head of the department receives his orders from the manager only and he has access to all parts of the plant, stores, offices, etc.

Record of Output and Idle Time

To obtain the maximum of production output from the several machines through the plants, each machine is fitted with a meter showing the number of feet manufactured daily. These figures are recorded every morning in the manager's office on a large chart, together with the total idle time of each machine. The chart shows the minimum allotted the machine, daily and monthly, and if the output is above the minimum at the end of the month, the foreman receives a bonus in cash, but if the output is below the minimum he is called in for a bit of a personal interview with the manager.

When there is a stoppage of a department or a machine for an unusual cause, such as mechanical defects or breakdowns, the production clerk notifies the manager on a special slip called "Signal for Manager," the cause of the unusual stoppage. If the cause is due to poor supervision of the Master Mechanic he is interviewed and the department affected gets a credit for the lost time, which does not affect the monthly percentage. Mr. Germain states that he has doubled his production in three departments and he has also improved his yard service to a point of great efficiency, as there is now no delays in deliveries of lumber to machines. Every foreman looks out for his supplies. Many men return at night to inspect their machines and put them in shape to start at the first turn of the engine in the morning. When the production is way above the minimum allotted, the bonus is worked on the extra footage produced



View in planing mill, showing Yates band resaw and matcher.

thus encouraging the foreman to do still better every month. Any defective material is charged to the foreman and taken out of his wages so as to prevent slackness or neglect to increase production at the expense of quality.

Perpetual Inventory of Lumber and Stock

The yards have a combined capacity of six million feet of lumber divided in two sections, one for hardwoods for the hardwood flooring department, and one for softwoods for the planing mill department. A third and smaller yard is used for storing lumber used in the woodworking factories such as pine, basswood, clear rough B. C. fir, etc. An unusual system of stock-keeping is in operation under the supervision of the Cost Accounting Department. Every lumber pile bottom bears a number which is never changed and the stock clerk's book contains a sheet bearing a corresponding number and the details of the stock examined in each pile. The stock clerk daily checks up with the piles in the yard the feet in the piles which have been handled during the previous day, adding or deducting the necessary quantities on the corresponding sheet in his book. In order to avoid errors, the yard foreman puts a signal (a piece of thin board painted in red) on each pile handled during the previous day; this the stock clerk collects and brings back to the yard office. The stock clerk enters in another book, called the "Lumber Book" under the proper specie, size, width and length, the changes which have been made during the previous day, so that the Lumber Book is always up-to-date. It is thus easy to ascertain the total quantity of lumber of a certain thickness, width and length. At the end of the month a stock sheet is made out from this "Lumber Book." Mouldings, hardwood floorings, doors, sashes, etc., are also recorded in the same way but under bin numbers instead of piles.

The shipping department, under the supervision of the head shipper and with seven tallymen, comprises twelve double teams, two five-ton motor trucks with semi-trailers, and four single horses for the handling of the lumber buggies in the local yards for the supply of lumber to the mill. When working at capacity, eighty men are engaged in the yards. The lumber receiving department is under the same supervision but it is looked after by the yard foreman only, who directs the location of all lumber received and the way it is to be piled. A standard piling arrangement is recorded on a map and no change is allowed to be made unless fully discussed with the management. This means a great saving of labor and space, besides being very convenient for new hands to become familiar with the yards in a short time.

Testing Lumber Going Into the Kiln

With a view to establishing a good and reliable grade of hardwood flooring every precaution is taken to manufacture a uniform grade of material equal to none as far as finish and dryness is concerned. The kilns comprise a battery of four progressive kilns twenty feet by eighty-five feet each, with a combined capacity of 320,000 feet. No lumber is allowed to enter the kilns before the percentage of moisture content is ascertained. If the moisture content is above

Hardwood flooring grading racks with compartment for each length.

or below a certain percentage it is directed into a slow or fast drying kiln according to the amount of moisture which must be removed. The importance of properly dried lumber for manufacturing purposes is recognized and to that end twice every day a record of the temperature in the kilns is taken from the recording thermometers, the air velocity as recorded by th anemometers, the humidity in each kiln is recorded by the hygrometers, and the outside temperature taken. When a lot of lumber is due to come out a thorough test is made. This test is very severe, the test pieces being subjected to a temperature of 450 deg. F. in an electric oven for that purpose. If the lumber under test shows more than 5.6 per cent. of moisture content it is not allowed out of the kiln.

Hardwood flooring department, trimmers and end matchers in foreground.

The manufacturing is followed throughout in the same strict manner. When the lumber is released from the kilns, it enters the flooring department on rails, where it is delivered to the rip saws. These rip saws were designed by the millwright of the company and differ from the others in the fact that regardless of the widths of the rough boards, the ripping is all done in one operation. There are two receivers to one feeder, as the wide boards multiply quickly on this rip saw. The receivers then place the strips behind the fast matchers, according to their widths. There are two fast P. B. Yates No. 87 hardwood matchers running continually making flooring. The flooring drops on a table alongside the trimmers after which it goes to the two C. M. C. upright end matchers. When the material is end matched, it is fed through an American flooring scraper, making it of uniform thickness. An inspector watches for any change in settings or other variations which might pass the operators. When the flooring is released from the scraper it is trucked away to the grading room, adjoining the large flooring shed. The grading room is equipped with a homemade device which automatically figures out the footage in each bundle without any possibility of error. This device has saved two men in the grading room, and besides several hours' work in the accountant's office. Each bundle is stamped as to the grade and footage.

A Busy Department—Scene in Sash and Door Factory.

Work Done On Special Orders

On the ground floor of the main building is situated the moulding department, which comprises four stickers, P. B. Yates and C. M. C. machines. Three machines are for stock pattern mouldings, and one for special work for the factory department. The stock mouldings are made on a requisition from the stock clerk according to the standing of the mouldings in stock in the large moulding shed. As a bin gets low a production order is made out; this goes to the moulding department foreman who divides the work so as to reduce the number and extent of changes in set-ups to a minimum. The meters on the stickers answer two purposes—they record the lineal footage of the stock run, and provide a record for the stock clerk.

The planing mill is off the main building, and is operated by a separate motor. It comprises one P. B. Yates 341 band resaw, one Montmagny circular saw and carriage for resawing large timbers, one power feed circular table resaw, and two fast feed P. B. Yates No. 91 softwood matchers. The lumber is brought in by lumber buggies and taken away in the same way, when not unloaded from one car and loaded on to another from the railway siding which is situated near the planers. With the trackage facilities

enjoyed and the efficiency of the layout of the planing mill and tracks, this plant can handle milling-in-transit, running the material from one car, through the machines and into another car, with a minimum of handling and a minimum of expense.

200 Doors and 500 Sash Daily

The woodworking factory is situated on the second floor. At the front end there are the offices of the superintendent, the foreman, the drafting room and the cost accountant's office. This department manufactures pine and B. C. fir doors, cupboards, stairs, sashes, frames and special millwork. It is equipped with the latest machinery in "duplicate battery" for quantity production. The benches are located on both sides of the upper floor, where the light is plentiful.

The breaking out department is on the lower floor, where the pine, B. C. fir, etc., is received from a special softwood kiln, on trucks. The factory foreman issues a requisition for every order manufactured, one copy going to the foreman of this department and the other copy to the cost accountant. The lumber is cut up to the size wanted, then sent to the upper floor by an elevator which takes up trucks and lumber, where it is delivered to the marker, who marks the material for the tenoners and mortisers and routes the work throughout the factory. All operations are recorded on the individual time sheet, under the proper order number, and when the article is finished the general office has the entire cost with the completed order. This department has a capacity of 200 doors per day and 500 sashes and frames besides other mill work. Adjoining the factory department, above the planing mill is the veneer department, where veneering of all descriptions is done.

Economical Power and Heating System

The power plant is in a brick building 60 feet long by 35 feet wide. The equipment consists of a 325 h.p. Corliss engine manufactured by the Jenckes Machine Co. of Sherbrooke, and two 125 h.p. boilers fed by Sheldon's refuse collectors. The engine and boiler rooms have been recently rebuilt, and new equipment added. All condensations are collected by an elaborate system of steam traps, which bring the water back to the boilers at a temperature of 210 deg. F. requiring but very little fuel to bring it up to boiling point, thus saving a large quantity of shavings, which are baled and sold as fast as they are available. The heating system throughout the plant is very effective. Besides the steam power there are one 100 h.p. C.G.E. electric motor and one 50 h.p. Crocker-Wheeler electric motor, making a total of 500 h.p. to operate the plant, besides small motors in the machine shop, grinding rooms, etc.

The company also have a steam creosoting plant, where they treat fence posts and timbers for underground construction.

One very active department is a newly organized advertising department, which has inaugurated a plan service. Advertisements are inserted in local papers notifying prospective builders that the company will supply sketches, floor plans, specifications, bill of material, together with the cost, delivered on the job within fifty miles from the plant, if on roads accessible to motor trucks. We understand that several sales of houses have been made already, and the demand for the service is very encouraging.

E. W. Tobin, M.P., is president; U. E. Germain, managing director; J. O. Asselin, secretary-treasurer, and P. Alegre and J. P. Mullins, directors.

Gibbard Team Heads League

The hockey team of the Gibbard Furniture Co., Napanee, Ont., won the championship of the Napanee Hockey League. Owing to the mild season, all the games scheduled were not played, but in the majority of those that were pulled off the furniture team came out on top. The accompanying group shows the team, together with some of the officials of the Gibbard Furniture Co. The following gentlemen appear in this group. Commencing with the top row and running from left to right we find: C. N. Loucks, F. McCullough, J. H. Moffatt, W. F. Vine, H. E. Loucks, G. W. Gibbard. Second row—Fred Huffman, Authmire Pybus, H. Belcher (manager of team), Ross Loucks, Leslie Richardson, Harry McNeil. Bottom row—Gerald Johnston, Ray Huffman, Harold Johnston.

Hockey team of Gibbard Furniture Co., Limited, Napanee, Ont.

Where is the "Joker"?

"Take for example a can of tomatoes on the merchant's shelf. Say this can cost him 15c. Say that that same brand of tomatoes can today be bought by the merchant at 9c. Suppose that merchant sells that can, which cost him 15c at 11c, has he made or lost money? Almost every merchant will tell you that he has lost 4c, when as a matter of fact he has made 2c. For, with 9c of the money that he has taken in can buy another can of the same tomatoes, making his stock exactly the same as before, and he still has 2c more than he had before."—The Canner.

Executives and Labor Efficiency

"From 70 to 80 per cent. of the inefficiency in industry is caused by management and by management I mean executives as distinct from workers and capitalists. Not all the loafing done by workers is due to their wanting to loaf. The worker wants a better and more efficient foremanship. He wants foremen who know their business; who are leaders and not drivers, who are fair and believe in the 'square deal'; who are sympathetic and human; who can interpret the ideals and ideas of the management to them. The economic fundamental in industry today is that there should be a maximum attainment per operation, per hour, per worker. Who will play the leading part in readjustment? The industrial executive."

Some of the small moulding machines earn as much money as the large ones, and considerably less power is required to drive them.

Are These Applicable to Your Plant?

Can the Following Suggestions Taken from a Bulletin Issued by a Well-Known Canadian Woodworker to His Employees, be Applied to Advantage in Your Plant?—Waste Should Not be Tolerated

By W. Warren

"The present time seems to me to be exceptionally opportune to take up with you the necessity of conserving, to the utmost, both material and labor and as far as possible handling our departments, so that a maximum of output may accrue with a minimum of outlay. You are more or less acquainted with the present state of the market. Business is quiet; orders are few and far between, whilst prices have dropped to cost and even below the cost of production. The public seems to be demanding lower and still lower values.

"We want to keep our factory operating and take on all the business that offers, but we are not anxious to take a loss on every order accepted. In other words, we are willing to forego all profit in an endeavor to keep the wheels revolving and provide work for our employees, but we are asking you as an employee to co-operate and assist us in keeping costs down to a minimum.

"There never was a time when greater efficiency was required than to-day. Our plant can only be kept operating at prodigious cost of upkeep; therefore, intensified waste elimination is absolutely necessary if we are to carry on profitably. Waste is a pernicious thing and our value to the firm is measured largely by our ability and willingness to reduce it to a minimum. This can be done in numerous ways; in fact, there is not a single department where it cannot be applied satisfactorily. Economy can almost be termed a virtue, and its steady application becomes a fascinating hobby and gives a pleasure and interest in our occupation.

Greater Efficiency From Dry Kilns

"In the operation of the factory in conjunction with the yard, it is imperative that we have an abundance of kiln-dried material; eighty-five per cent. of the material used in the factory must be artificially dried. We have never caught up in this section. Our kilns, if operated fully, are capable of curing 60 M ft. every two weeks; if less is handled, then, we are operating at a loss, and this loss extends itself to and is shared by the factory and mill, and so becomes a triple loss, slowing up our production and making itself felt in every department. It is, then, of the utmost importance that the same day a kiln is unloaded that it be reloaded and operated at once; otherwise the most expensive kind of waste steps in. We must co-operate in preventing this kind of waste.

"Regarding the storage of dry lumber, heated housing capable of handling 100 M ft. has been provided, and this space must be made full use of, and no kiln-dried hardwood stored except in its proper places. If stored otherwise, re-drying becomes necessary at a cost of $10.00 per M, often deteriorating the lumber.

"In deciding the grade of material to be used, we often allow precedent to step in and control our judgment. All precedents are out of date, and must be discarded. Conditions as they are to-day must be uppermost in our minds and our decisions based thereon. Do not give a customer clear pine for paint purposes, without first acquainting him with his mistake. Do not use clear stock if common will serve the purpose. In brief, supply material suitable for requirements, and so eliminate waste.

Exercise Judgment and Foresight

"Coming to plant upkeep, the line of least resistance is the one we are prone to follow. The price of equipment is out of sight. When asking for a new belt, new knives, repair parts, saws, etc.; before discarding the old, see if it cannot be repaired at less cost than the price of a new piece. In the majority of cases it can, and a very considerable saving may be effected by a little thought and effort in this direction. You can quite easily squander a week's or even a month's wages by ordering something that a little forethought might save. There is room here for waste elimination.

"There is scope in the shipping department to distinguish ourselves by rigid economy both as regards material and labor. One of the most essential points is to see that the trucks and rigs are properly loaded. There is nothing that adds to the cost of shipping to the extent that waiting for a load will do. On close investigation I find that our trucks occupy approximately one-third of their time in the yard. This is out of all proportion and must be remedied. It spells waste of the worst kind. What is true of the trucks is also true of the waggons.

Eliminate Waste Wherever Found

"Another important point in this department is to see that the undershippers leave the piles in the same condition as they find them. When covered, uncover them and take the stock as it it is piled. There is a tendency to throw off some of the top pieces, sometimes because the sun has affected them, and by persistently following this practice, the percentage of waste is alarming. The material thus handled is reduced to culls and often to no value.

"No matter what our position in the woodworking business may be, we shall not be successful unless waste elimination is the uppermost thing in our minds. A man may be an excellent mechanic, but if he is wasteful he is worse than useless and merely a bill of expense. To be valuable to our employers, we should be cranks regarding waste.

"I ask that you give waste your consideration, and let us act in unison to root out any undue leakage."

Commercial Value of Sawdust

Sawdust as a waste product is a thing of the past for it now serves many purposes and has an ever-increasing commercial value. Mixed with clay it makes good tiles and bricks and combined with concrete a good flooring material is obtained. It also finds a place in the dye industry for coloring purposes.

A gas, excellent both for lighting and heating purposes, can be made from sawdust. It is believed that, particularly in the neighborhood of sawmills, the gas could be produced so cheaply as to be supplied for a few cents per thousand feet.

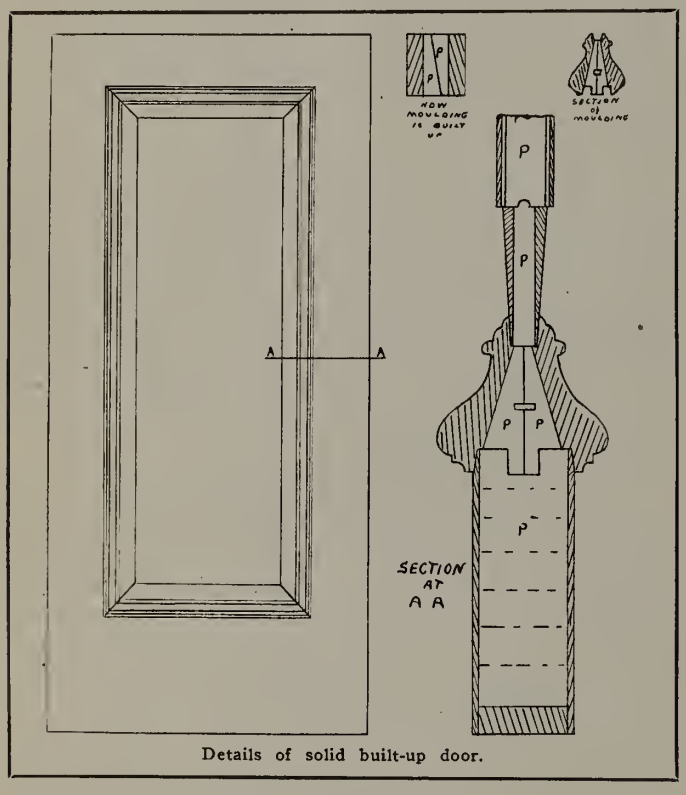
Improved Idea in Built-Up Door Construction

Each Part Made of Laminated Construction—Effects Saving in Amount of Fancy Wood Required—Makes Strong, Substantial Door

By D. L. W.

One of the newer ideas in built-up door construction is shown in the accompanying illustration. These details were taken from a batch of doors, in quartered white oak, being made for a high-class interior fitting job by the R. Laidlaw Lumber Co., Toronto. It may be said to be a real built-up door for every part is of laminated construction.

At first glance one might think that following out this suggestion would entail a lot of extra work, resulting in a very expensive door. Mr. Warren, the manager, says that this is not so. Where a number of doors are going through, he did not think that the cost, when this construction is used, would be any



Details of solid built-up door.

higher than for a door built after the usual fashion, adding that it could not be used to advantage on a cheap or medium-priced product as it was a strictly high-class proposition.

The stiles and rails are built up in the usual way, with a pine core having a strip of oak on the outside edge, and faced with ¼" quartered white oak veneer. These are grooved, mortised and tenoned as usual. The edges facing the panel opening are bevelled slightly. This corresponds to a slight taper to the groove in the moulding and ensures a snug fit for the latter.

The moulding is built up as shown in one of the small insets; that is, oak is glued on both sides of a pine core. It is then slit diagonally through the core on a smooth-cutting rip saw (the reason for using a smooth-cutting saw is so that one of the pieces may be reversed and glued again without jointing) and the groove cut on saw also. The idea of placing a tongue here is to overcome any tendency the two pieces might have to slip when the pressure was being applied, owing to the fact that the two faces are not parallel. Working this way permits of full advantage being taken of the quartered figure in the wood. The completed lengths are now run through the sticker in the positions shown, the two side heads doing the shaping and the under head cutting the two grooves.

The raised panel is built up in two sections, the raised centre piece, which is of five-ply construction, and the outside or rim. The five-ply panel is laid up with crossband and face veneer, then cleaned up and trimmed to the exact size required and the groove run on a shaper. The outside piece of rim is built up and run through the sticker, where it is bevelled and the tongue made. It is then mitered and glued to the five-ply centre section. The advantage of this method is that advantage may be taken of five-ply construction for the panel, giving a stronger, more permanent job and eliminating much of the tendency to warp and buckle, and the raised effect may be secured without using ⅜" or ½" face material which would be necessary if the panels were raised in the usual way by cutting down on the shaper or panel raiser.

In assembling, the doors are first put together without glue, dry joints, and the mouldings mitered and fitted and everything made ready for the final assembling. It is necessary that the panels must be put in as the doors are assembled. The mouldings are glued to the stiles and rails and a dry joint is made between the panel and moulding. The groove in the top of the moulding is tapered slightly to conform to the bevel on the rim of the panel and thus ensure a tight joint.

When built this way, all nails are eliminated, there is no danger of the mouldings coming loose, the five-ply panel will hold its shape, a saving has been effected in the amount of oak used, and a better door produced.

Building on Increase

From figures recently issued by the MacLean Building Reports, Limited, Toronto, it would appear as if the building industry in Canada is getting away to a good start. The figures show that for the first two months of 1921 contracts were awarded for residential work valued at $4,212,000, as compared with $3,810,400 for 1920 and $2,096,000 for 1919. In addition, permits were issued for residential work to the value of $7,123,000. During the same period contracts were let for business blocks, warehouses, office buildings, etc., valued at $13,335,000. This compares very favorably with the figures for 1920 which were $9,880,500. As the prosperity of the furniture and woodworking industry is largely dependent on activity in the building field, it would appear, from these figures, as if the woodworkers in Canada have little or nothing to fear for 1921.

The automatic screw-driving machine has done away with a great deal of hard, tedious manual labor.

D. R. Brewster Defines Good Kiln Drying

Artificial Seasoning Too Important to be Given Scant Attention—Only Ten Per Cent. of Manufacturers Realize True Value of Proper Drying—Competent Operator Big Factor

(Concluded from March issue)

The second class of dry kiln operations might be called the "hit or miss" class. At these plants the importance of the dry kilns in a woodworking factory has been more or less appreciated. Steps have been taken to improve both drying equipment and practice. But action has not been based upon a thorough familiarity with different angles of the problem. Kilns have usually been purchased because of the advice or experience of some acquaintance in the same line of business. Sometimes this acquaintance has been well posted on the subject and has given reliable advice. More often, however, he too has not studied the question thoroughly and his kilns and methods are far from the best for the purpose. Thus, unsatisfactory kilns and methods are passed along from one plant to another. As a result, a large number of factories have found, after spending many thousands of dollars for new kilns, that these kilns are poorly designed and poorly suited for their purpose.

If, by chance, such plants happen to be fortunate in their selection of a kiln, they still have to solve the problem of satisfactory kiln operation. Lack of knowledge of good operation often causes costly blunders even when a plant has excellent dry kiln equipment.

It has been said, in fact, that good kiln drying is 90 per cent. operation and 10 per cent. kiln. Personally, I believe this is overstating the case, and that a good kiln has more of an influence than that on successful results. However, it is unquestionably true that a good operator can do better drying with a poor kiln than can a poor operator with a good kiln. This is not an argument against getting a good kiln simply because you may not be able to get a good operator, for even a poor operator can do better work with a good kiln than he can with a poor one. It is rather an argument for both a good kiln and a good operator as the right solution of the problem.

The "Safe and Sure" Class

The third and most successful class of operations seeks this solution. I have termed them the "Safe and Sure" class. Realizing that a good kiln drying is not only important, but vital to the greatest success of their manufacturing operations, these "safe and sure" plants investigate the whole subject of kilns thoroughly before they finally decide on the type they want. They study the principles of kiln drying and secure unbiased advice and information from government and other research and technical service agencies. They secure catalogues and information from a number of different dry kiln companies and weigh all the statements and arguments in the light of the facts and principles developed in scientific research work. They then decide on the type of kiln best adapted to their needs and select the one which will be most economical in the long run, making the first cost a secondary consideration.

After the kilns are built, these "safe and sure" plants make certain that they will be properly operated by securing a competent and well-trained kiln operator. Since trained and experienced operators are scarce, they have found that the best plan is to select an intelligent, ambitious man from the factory organization and give him special opportunities and encouragement in learning the technique of good drying practice. This can be learned first, by studying the literature provided by the government and sent out by the Technical Service Department maintained by some of the leading lumber companies; second, by studying the correspondence course in kiln drying given by the engineering department of one of our universities; third, by taking the short courses in kiln drying given at some of the forestry schools, or, fourth, by attending the ten-day short course for kiln operators now being given each month at the Government Forest Products Laboratory.

Importance of Intelligent Operation

After securing a grounding in the principles of kiln drying by one or all of these methods, any man of average intelligence and interest in his work will be able to work out the application of these principles to the correct operation of a specific set of dry kilns. As a matter of fact the subject of kiln drying is really neither technical nor complicated—nor nearly so much so as operating an automobile and keeping it in good running order. Yet many thousands of men have become chauffeurs and truck operators in a comparatively short time.

You would not maintain a motor truck without a trained and competent driver. Nor would you become discouraged in the use of a truck because good drivers are scarce. You would either search until you found a good driver, or else develop one. In the same way, realizing that poor kiln operation may, in a very short time, cause a loss several times what a good operator would cost for a whole year, the "safe and sure" plant makes it a point to find or develop a trained man to run its dry kilns.

All along the line—in the yard, in the kiln, in the factory—the intelligent "safe and sure" policy will constantly pay big profits in the seasoning and kiln drying of lumber. These profits will result first, from a reduction of investment in yard, lumber and kilns; second, from decrease of time in drying; third, from smaller losses of stock in the kilns; fourth, from obtaining a steady and dependable supply of raw material for the factory, and fifth, from eliminating loss of stock and labor in the factory due to casehardening, checking, warping and honeycombing. If your plant is already in the "safe and sure" class you are even now benefiting from these profits. But if there is any reason to suspect that you may still be in either the "Hit-or-Miss" or the "Foolproof" class, I earnestly suggest that you give the matter of good kilns and good kiln operation your immediate and careful attention in order that you, too, may benefit from the profits which result from adopting the "Safe and Sure" plan.

But 10 Per Cent. Kiln Dry Right

My acquaintance with hundreds of plants leads me to estimate that at least 50 per cent. of all kiln operations belong to the "foolproof" class. At least another 40 per cent. belong to the "hit-or-miss" class.

Only the small remainder—not more than 10 per cent. —deserve to be classified in the "safe and sure" class. However, I do not mean to criticize the first two classes. They can hardly be blamed for their lack of an understanding of good kiln drying because modern kiln drying practice, as we know it to-day, has been developed only in the past few years.

As a matter of fact, the need for more careful and scientific methods has become apparent only since hardwood lumber has become scarce and high-priced. Not many years ago when plenty of thoroughly air-seasoned hardwood stock could be had at a small fraction of present prices, it may have been more economical to waste part of the stock in poor kiln drying, rather than to go to the expense and trouble of reducing that waste by better kilns and better practice.

Fortunately now that it does pay to eliminate such waste, you will be encouraged to know that it can be done, and oftentimes at surprisingly small cost, particularly to those plants that already have kilns. For good results, it is by no means necessary to scrap the old kilns and build new ones. Even where it would be advisable to do this eventually, it should often be possible to postpone the building of new kilns until building costs go down, by simple alterations in present kilns. In any case I would advise you to consider the possibilities of alterations vary carefully before deciding to invest in entirely new kilns and equipment. Remember that, after all, the operator is more important than the kiln, and bend your efforts first toward securing a competent operator and then do what you can to provide him a good kiln.

Should Pay Profit

To sum up, then, good kiln drying requires first of all a kiln in which temperature and humidity can be varied and controlled and in which the circulation of air will give uniform drying results in all parts of the kiln. In addition the kiln should be provided with means for steaming the lumber. Having such a kiln to work with the operator should understand the principles of drying lumber and keep careful records of kiln operation; he should test the moisture in his stock and govern his drying conditions accordingly; he should test for casehardening and steam the stock when necessary to relieve casehardening; finally, he should bring his stock out of the kiln with moisture content evenly balanced and neither too high nor too low, free from casehardening and ready for use.

In this short talk on kiln drying, I have only been able to hit a few of the high spots and have had to purposely omit all but a mere mention of many important points. I realize fully that what I have said will probably not enable any of you to return to your plants to-morrow and start working out your drying problem without further information and assistance as to details. The most that I could hope to do in such a limited time was to outline to you the main requirements of good drying practice, with the hope that I might arouse your interest and curiosity to the point where you would want to follow the matter much further and find out the practical application of the general principles to your particular plant and problem. I can assure you that you will be well repaid for the time and effort required to study this subject thoroughly, and I shall be very glad to furnish any of you detailed information as to where you can obtain advice and assistance and reference material on the various phases of dry kiln design and operation.

1921 Will Reward Fighters

These are unusually strenuous times, not only in the millwork industry, but in all industries, and in my opinion we will never again see the time that millwork will sell itself without any effort on the part of the producer, says W. P. Flint, secretary of the Millwork Cost Information Bureau, in an address before the Southern Sash, Door and Millwork Manufacturers' Association. You had this bureau and your association as a guide during that frenzied period—neither of which failed—and most firms conducted their business in such a manner that a reserve was created, which will make it easier to finance a period of dull market conditions.

This does not mean that you should sit with your hands folded and wait for business to come to you, for we will never again see conditions as they were and it will be necessary for you to make an aggressive, intelligent selling campaign, if you wish your share of the business that is bound to come to the intelligent manufacturer. In this connection, I call your attention to the slogan of the Chicago Tribune—the world's greatest newspaper—which is being given wide publicity—"1921 will reward fighters." Gentlemen, this is great, and by fighters is not meant price cutters, or the selling of your product below cost.

Be fighters in 1921 and go after every prospect that you hear of. A cat is a waiter, as it is evidenced by the manner in which she sits at a hole waiting for a rat to appear. A fox terrier is a fighter and doesn't wait until he sees a rat to go after it. Just mention the word to him and see his ears prick up. Give him a smell of one and watch the dirt fly until he has a hole large enough in which to follow and secure his prize. Conduct your business, men, in the same way. Don't be a cat and wait for it to come to you, but be a fighting terrier and dig it out.

Now comes the important part. What good is any business you may secure if you do so at less than cost of production? None whatever. And the length of time you will survive is measured by the reserve that you have accumulated. Why do you consider it necessary to sell below cost? I don't think you do consider it necessary, as it has been proven by past experience that such a price does not create any new business. The next question you may naturally ask is: "What shall we do?" My reply is, "Fight and create business, but know your cost in fighting, as that is your most effective ammunition."

Relative Prices of Lumber and Other Building Material

Home-building is still retarded by high costs of labor and materials, and popular feeling is strong for reductions all along the line.

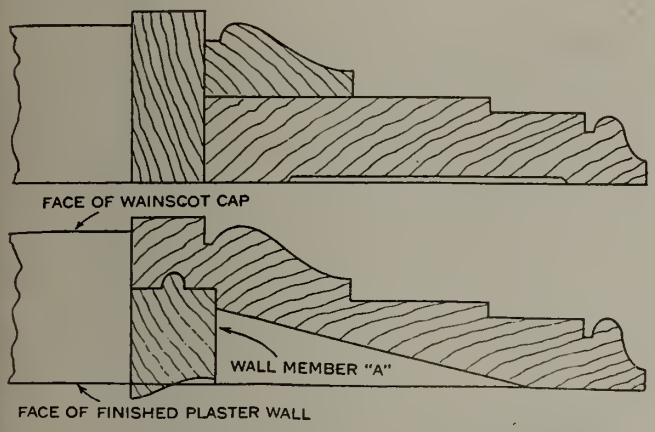
In any popular discussion of building costs, attention is naturally given first to lumber, as it is commonly thought that lumber is the heaviest item in the cost of frame buildings. People learn with surprise that the cost of labor runs to about seventy-five per cent. of the cost of building, and that the cost of plumbing is frequently more than the cost of lumber.

As compared with other building materials, lumber and structual steel have declined most from the prices of 1920, and the attention of the public should be called to this fact.—The Wood Box.

Suggestions for Planing Mill Operator

Economic Production of Special Design in Interior Trim—How One Firm Gets Out Special Order Frames—Separate Cutting Bill for Stock and Interior Trim

Often, in designing hardwood door trim for special jobs, an architect will call for heavy molding with large projection, or it may be necessary because of a projecting base or wainscot. Formerly it was built up in three or more members, as shown in the accompanying sketch. As the various members shrunk perhaps unequally, unsightly lines appeared, which



Economical method of running door trim.

marred the appearance of the trim. This has been overcome in many instances by running the trim in one piece as illustrated.

With one piece of wood across the face, the shrinkage is equal and there are no joints to show up badly; also, in fancy figured woods the grain presents a uniform figure across the face. It is also economical, as rippings can be used for the wall member A. By making wall member A as shown, the sharp edge will press directly into the plaster, thus concealing any unevenness in the plaster. Any one having seen open spaces between the back of trim and plaster will appreciate this advantage.

This method can be used for almost any profile of trim that may be designed. Generally 1-in. lumber can be used, although occasionally it may be necessary to use 1¼-in. material, if the moldings are very deeply cut. If only because of the time saved in setting up and running the material, this method commends itself to the progressive millman, and, where once tried, it is almost certain to be used again.

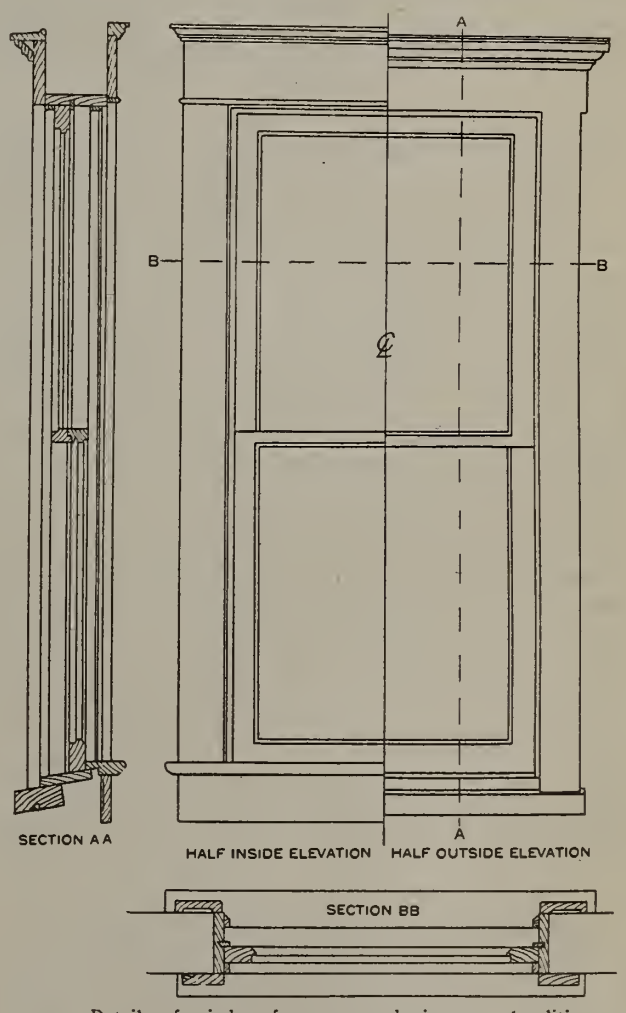
Another suggestion: We will assume that in the routine of business a planing mill receives an order for one skeleton plain-head window frame, 24x28 glass, 1⅜ sash, double-hung, 5¾ jamb and yellow pine finish inside. The sash size of such a frame is 2-ft. 5-in.x5-ft. 2-in., as our mill makes it—1 pair w. pine sash, 24x28 (2—5x5—2), 1⅜, 2-lts., check.

The order is written for the mill and two duplicate slips are made. The original slip goes to the mill, together with the cutting list for the frame. One duplicate goes into the file, and on the back of this card the time, lumber and other necessary data is noted, and the total cost recorded when the frame is finished. The third slip goes to the shipping clerk.

A duplicate slip is made of the cutting bill and given to the yardman, who sends the required stuff to the man who cuts the stock for frame, and the original slip goes to the cutter. After the stock is cut it is put through the sticker, then goes to the trimmer, who cuts all the stuff to its required size, cuts the dadoes and puts the pulley stiles through a machine which makes the mortises for pulleys and cuts the weight pockets. From the last-mentioned machine the stuff goes to the sander, thence to the frame-maker, who puts the pulleys into the pulley stiles and assembles the frame except that he leaves the tintel loose as it has been found that the lintel is easily torn off during the handling of the frame when being shipped.

The frame is now finished at the mill and is put into the warehouse. The benchman, having the frame completed, returns his slip to the foreman, who in turn puts it into the office. The clerk, after having received the time-card, figures up the entire cost in lumber, hardware and time, and thus the cost of the frame is established.

The inside finish required for this window frame



Details of window frame as made in many localities.

is not gotten out immediately, but is measured up later by the man who measures up all interior finish when he is notified that the millwork is ready to be measured up. The mill measurer takes the size of

the frame at the sash opening, thus—1 skeleton window frame, 2—5x5—2, Y. pine finish. After determining the style of trim required, which we will assume is 4¼-in. plain trim, 1⅛-in. stool and cabinet head, he enters an order in the mill for the trim as shown.

This finishes the window frame complete, as far as the planing mill is concerned. The second sketch

shows the construction of the frame as it is made in many mills, viz., a section on line AA of the outside elevation, a section on line BB, and half-inside and half-outside elevation.—The "Woodworker," Indianapolis.

Chappells, Limited, Acquire New Plant

Mention was made in a recent issue of the "Canadian Woodworker" of the fact that Chappell Bros. & Co., Limited, of Sydney, N.S., had taken over the Sydney plant of the Rhodes-Curry Co. or Truro, N.S. This has been accompanied by a reorganization of Chappell Bros. under the name of "Chappells, Limited," and an increase of capital stock from $50,000 tc half a million. The officials of the new organization are as follows: R. R. Chappell, president; M. R. Chappell, managing director and vice-president; Wm. Chappell, consulting engineer, and James H. Chappell and George A. Chappell, directors.

The purchase of the Rhodes-Curry plant is one of the largest transactions that has taken place in Cape Breton for some time. The deal includes all the real estate, plant and machinery with the exception of a quantity of contracting equipment. The acquisition of this property gives Chappell Ltd., an additional 150 feet of railway siding and more than double their warehouse and storage capacity. At the present time they are running both retail yards and when the volume of business warrants, will put the recently acquired plant in operation.

Chappells, Limited, do not look for any great change in prices during the coming season.

Orange Box Industry in Palestine

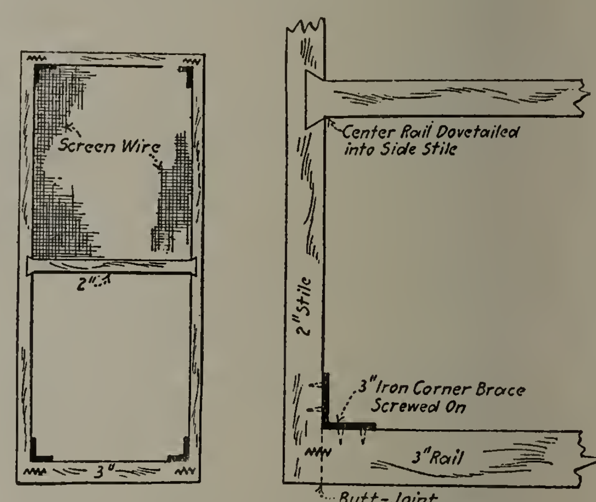
Orange boxes are made in Jerusalem of lumber imported from Roumania and Austria, but recently Norwegian and Swedish lumber has been used, says the United States Commerce Reports. Some of this material comes sawed to the sizes required, and some is sawed at Jaffa. The dimensions of the sawed boxes are as follows: length, 68 centimetres (26.77 inches); width, 32 centimetres (12.59 inches); height, 27 centimetres (10.62 inches). One partition is used. The thickness of the ends and partition is 16 millimetres (0.65 inch); thickness of the sides, 8 millimetres (0.314 inch); thickness of tops and bottoms, 7 millimetres (0.27 inch). The box itself weighs about 4½ kilogrammes (10 pounds), and its contents about 33 kilogrammes (72.75 pounds).

Since the Armistice the price of lumber has declined, and still greater reductions are expected, which restricts purchases to immediate requirements. The orange season in Palestine lasts from November to March, and contracts for lumber are made in the summer for delivery in August and September.

Make Screens During Slack Period

A reader of the Canadian Woodworker offers the suggestion that the making of full length window screens offers a profitable form of employment for shops that are finding things quiet. Old pieces of lumber may thus be turned into saleable articles and a certain amount of work provided.

The accompanying sketch shows a satisfactory type of screen which was made by the writer. The



Screen made with square butt joint.

stock is one and one-eighth material; thoroughly dry and seasoned. The centre rail is dovetailed into the stiles, making a strong joint. The corners are butt-jointed, using corrugated fasteners and wrought steel corner braces, instead of the usual mortise and tenon. This makes a supposedly better frame than when the mortise used for the wood is left full strength at its weakest point, the joint. The wire is tacked on in the usual manner, along the edge of the frame and covered with a half-round or suitable wood moulding. The most suitable form of hanger to use is those which are interchangeable with storm sash hangers.

Don't try to make enemies; they will make themselves without your help.

In business, as in other matters, to give is to gain; they gain most who serve best.

What Kind of Oak Do You Prefer?

Have You a Preference for Stock From Any One Section?—Does High-Land and Low-Land Oak Differ in Texture?—Read What Others Have to Say, Then Send in Your Opinion

There is more to buying lumber than specifying a certain suitable grade of stock and letting it go at that. Lumber from different sections and even different parts of the same district have varying characteristics which make such wood more or less desirable for certain specific purposes. This might be illustrated by considering the case of oak lumber.

Some reader may say "Humph! Oak is oak." So it is, but oak from Virginia differs in quality, texture, strength and grain from oak grown in Arkansas, for instance. For certain work on certain articles, one might be preferable while for some other equally important purpose the other wood might be considered more advantageous. Another point is that the state or section in which the oak grows is not the sole controlling factor for lumber from the same section, only cut from high or low land varies in its several qualities.

As a general rule we may take it that wood growing in the warmer, milder climate of the south, is softer in texture and possibly more even and finer in grain, than that grown in the more rugged northern climate. Again, as suggested above, timber from high land is harder in grain and texture than that from low lands.

A number of furniture men were asked by the "Canadian Woodworker" if they made any distinction between oak from various sections, and to outline their experience with stock from different localities. The following replies should prove of interest and value to all wood users: One western Ontario manufacturer states that in our plant, in which we make dining and chamber furniture, we prefer oak of soft texture, which grows in West Virginia on high land, but for chair work a much harder texture is preferred, for the reason that soft wood is not of sufficient strength for frail parts. There are many localities in the States where soft wood is procurable, and the geographical location does not make all the difference. It depends largely whether the timber grows on high or low land. The low land oak is always of hard texture and character, and this is what the waggon-makers prefer on account of its great strength, but if we were to finish this on our fine furniture, the result would not be pleasing, as the stain will not penetrate evenly and it is only suitable for painting.

The soft oak has a large open pore, and the soft parts will absorb the finishing material, and the flakes will remain bright, forming a golden cast between the two which, as already stated, cannot be obtained in hard oak. The soft wood is very much easier handled. It takes less time to dry, and then again, saws and knives cut it with greater ease, saving power and so forth. We could enumerate many other objections, but we trust with the information given you, that some of your readers may be guided when purchasing oak in the future.

Another well-known furniture man says: We have used oak from different states—Mississippi, Missouri, Arkansas, Louisiana, Kentucky and West Virginia. We find the latter the most suitable for our purpose for the following reasons: It is of an even texture—uniform color—and considerably softer than what we have had from other states. The last five years we have practically had no other oak than that grown in West Virginia..

Other opinions submitted are as follows:

"We are not large users of oak, but we prefer to secure oak from Virginia and that vicinity, rather than the stock grown further south, or here in the north. We like it because it is softer and we think takes a nicer finish. It is decidedly easier on our equipment throughout the factory and nicer to handle."

"Our experience with quartered oak has been limited almost exclusively to Indiana and Kentucky stock. For golden oak, the soft textured wood shows to much better advantage, and is of a more even color. While it costs considerably more at certain times, we think the extra quality makes it well worth the difference.

"For fumed oak, with care in selecting, the southern woods are good, but the extra time selecting takes away some of the advantage of the difference in price. For this reason we always buy the northern grown stock."

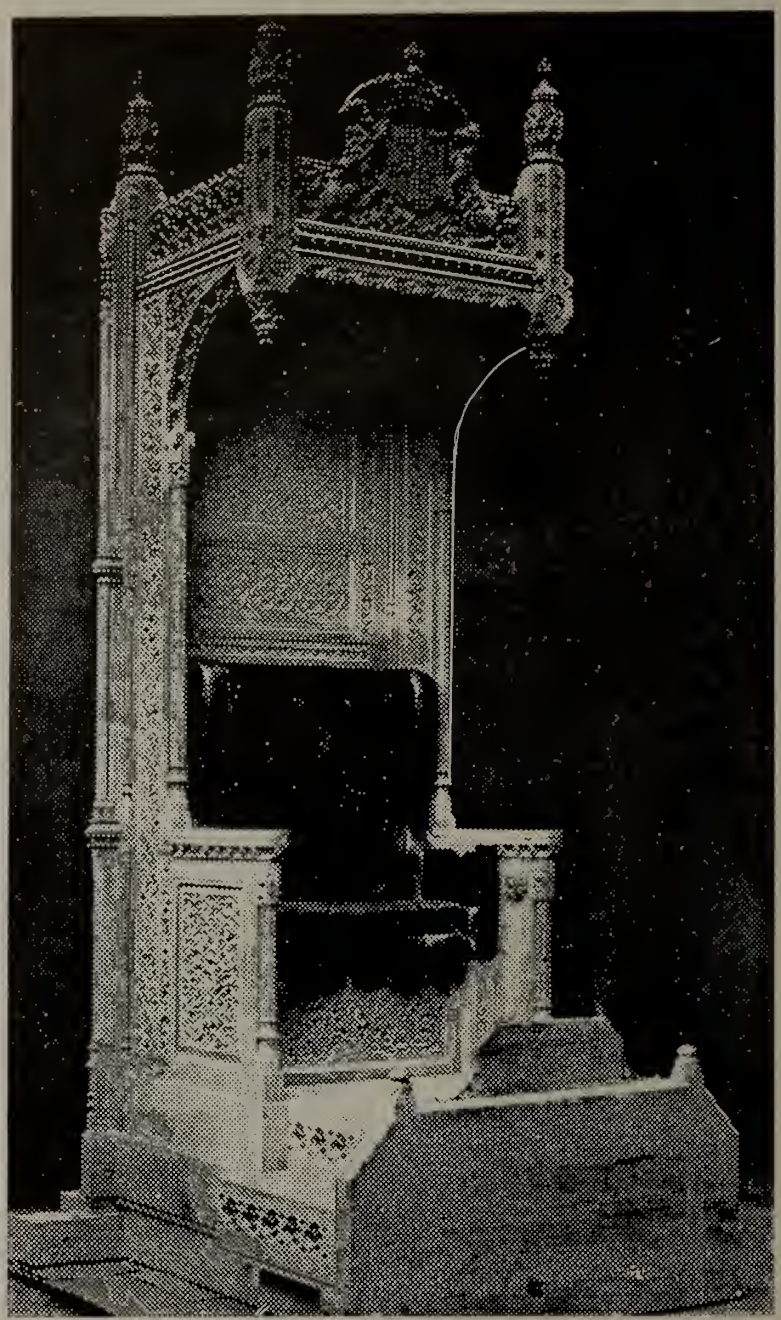
'We have had only little experience with American oak. The only kind of oak we have been manufacturing is plain red oak. However, we prefer to have eastern "grown stock," as it will machine to better advantage. We also find that this stock has a closer grain than the Southern oak, thus giving smoother and more uniform finish."

Important Gathering to Discuss Costs

All woodworkers, who are interested in costs, are invited to attend the seventh annual meeting of the Millwork Cost Information Bureau to be held in Chicago, Wednesday, April 27th, 1921. A very instructive and interesting programme has been prepared. This gathering offers an opportunity to secure first-hand information pertaining to the cost and estimating problems encountered in the woodworking industry. Cost systems that are giving every-day service in various plants will be described and analyzed; the weak points brought out and improvements suggested. In issuing this invitation, which is extended to non-members as well as members of the association, the secretary, W. P. Flint, states that "you will not be called upon to digest a mass of ideas that are practical in another industry and not in yours, but only such information that is actually in every-day use in the millwork line."

This organization enjoys a membership extending into Canada. Among the Canadian members are found the following firms:—

R. Laidlaw Lumber Co., Ltd., Toronto, Ont.
Henry Morgan & Co., Ltd., Montreal, P.Q.
Wm. Rutherford & Sons Co., Ltd., Montreal, P.Q.
P. W. Gardiner & Son, Galt, Ont.
Midland Wood Products, Ltd., Midland, Ont.
Midland Woodworkers, Ltd., Midland, Ont.
J. R. Eaton & Sons, Ltd., Orillia, Ont.
The Laberge Lbr. Co., Sudbury, Ont.
Radford-Wright Co., Ltd., Winnipeg, Man.
Moose Jaw Millwork Co., Ltd., Moose Jaw, Sask.
Regina Sash & Door Co., Ltd., Regina, Sask.
Western Mfg. Co., Ltd., Regina, Sask.



Replica of Speaker's chair in British House of Commons.

New Speaker's Chair for Ottawa

The Speaker's chair at Westminster is famous for its artistic beauty and dignity in design. It is considered to be a perfect specimen of Gothic architecture. In the replica for the parliamentary buildings, Ottawa, the original chair has been carefully reproduced. Many photographs, plaster casts and other accurate details have been taken and faithfully followed. The foliated canopy, the intricate carvings and mouldings, and the graceful pinnacles and pendants, are some of the finest examples of the carver's art. The royal arms which surmount the canopy are carved from the old oaken beams from the roof of Westminster Hall. The back of the chair contains many delicately worked linen-fold panels, each with the monogram "V.R." and the wreath and inter-twined cord. On the folded ribbon, amidst the ornate carving on the right side of the chair is inscribed "Manus justa nardus memor et fidelis mens conscia recti," and on the reverse jamb, "Nec prece nec pretio libertas in legibus hostis honori invidia laus deo." (The hand that deals justly is a sweet smelling ointment. A heedful and faithful mind is conscious of righteousness.—(Justice is influenced) neither by entreaties nor gifts. Liberty lies in the laws. Envy is the enemy of honor. Praise be to God.) The chair, which has a total height of 13 feet 6 inches, is a gift to Canada from the members of the United Kingdom branch of the Empire Parliamentary Association. The replica has been executed by Messrs. Harry Hems & Sons, Exeter, under the direction of H. M. office of works.

Situation Calls For Close Co-operation

Box Men Put Their Business on Sound Basis—Hampered by Excessive Freights—Wages Must be Considered—Greater Efficiency Required

By B. F. Masters, Chairman, Board of Governors*

When we met a year ago at our annual meeting our industry and the business industries of the country were at about the peak of prosperity. Our factories were all running at full capacity, there was a splendid demand for our product, and I presume that all of us were very agreeably pleased with the results of our business for the preceding year, and the prospects at that time were very splendid for a continuation of, you might say, abnormal business, because the business conditions that existed a year ago were a little bit abnormal. We called them normal because they were about up to the capacity we reached during the war when we all went a little better than a normal condition to meet the exigencies of that occasion.

At our last meeting, which was in October, we perhaps did not realize the situation we were facing at that time and which has since developed. We were not competing much at that time. We were still running along on a fairly even basis of production and of demand, and prices were being maintained, so that our product was being manufactured and sold at a profit. We are here to-day under a condition that marks perhaps the most extreme and most divergent view and condition of previous meetings that has ever existed at any meeting of this association.

Box Industry Not Alone

Our business is not the only one that is affected by the depression through which we are passing, or at least of which we are in the midst. I hope we are passing through it. Some people even predict that we have reached the bottom of the depression and deflation. That is a question that may be argued pro and con. I wish I could bring you some message on that subject. I can't. I don't think any of us know very much more than the rest of us, but it is notably true that some lines of industry have not been deflated, if I may use that word, or liquidated to the extent that our industry has. There may be some industries in which this deflation or depression has been equally or more pronounced, but my personal view of the situation is that we cannot have stability in business until all the basic commodities have been deflated or liquidated on a comparative basis. I doubt if there is a manufacturer here to-day who would be willing to see the present depression in the lumber and box industries continued and have it stabilized on the present basis without a like deflation in some other industries with which we come in contact. It is my opinion, for what it may be worth, that we will not have complete stability in the various lines of trade, and complete confidence in the minds of the buying public and in the business men of the country, the financial interests and all others that combine to produce a demand for business, until this deflation is general.

Without mentioning the lines in which deflation has not been complete, the most notable example and perhaps the key to the industrial situation to-day is the railroad situation and with the excessively high freight rates that prevail to-day, and when I say excessively high freight rates I do not mean that the railroad companies are receiving very much more freight than is necessary to pay the enormous wages and other elements of service that they are obliged to pay under the present rules and regulations, but with transportation standing as it is to-day and with the part it plays in our commercial enterprises and in our business, it is not reasonable to believe that our industry or any other industry can be stabilized upon a rock bottom basis, that your prices can be brought down to the irreducible minimum, until freight and transportation charges have also been brought down to a comparative level.

Readjustment in Wages Must Come

The great problem of to-day seems to be between labor and capital and seems to be which should take the first step in reducing the cost of production. There are many industries, particularly in large centres, in which union labor prevails, where wages have not receded to any extent whatever, for I think I am safe in saying that there are not over three or four labor unions in Chicago that have reduced their wages over the high peak that was paid during the most exciting days of the war. This is not so nearly true in the smaller centers nor is it true to as great an extent in sections where union labor does not dominate. Our railroads are manned from bottom to the top, clear down the line, with union labor, and the Federation of Labor has declared itself very positively against any reduction in wages. The railroad companies are not buying, as we all know, probably for the reason that they fear they cannot afford to buy. They are seeking the privilege, as you know, of making new contracts with their employees. This attempt is being combatted by the employees because they say before wages are reduced capital must reduce its income and must reduce its rates, bankers and financiers and capitalists and manufacturers; in other words, capital must reduce the level of its prices in some way that will bring down the cost of living before wages are reduced. It is a thrice-told tale and we all perhaps have our notions about it. I don't suppose any of us feel that we want to burden labor with the responsibility of bringing the commodities down on a pre-war level without sharing in the reduction in the cost of living, but it must be admitted that the cost of living is being reduced gradually, in many lines to quite an extent, and still one outstanding argument against the reduction of wages, particularly in the large cities, is the excessive rents that are being charged. Chicago, perhaps stands foremost in that situation. There are some statistics given out this morning that indicate the scarcity of homes in general is not so great as we have been led to believe, but the impression has prevailed here that there are not enough homes in Chicago for Chicago's citizens, and consequently those who have homes have been putting rents upon a basis that has entirely precluded the possibility of any reduction in wages to the laboring man. So that we have the conflicting conditions, the employer on one side, expecting a reduction in wages, and faced with the necessity of reducing the cost of his product, what-

*Address, National Association Box Manufacturers, Chicago, Ill.

ever he may manufacture himself, and labor, on the other hand, confronted with the necessity of providing food and clothing for themselves and their families.

Selling at or Below Cost

It is difficult to foresee what the present tendency may lead to. The tendency of prices at which products are sold has declined very much more rapidly than the cost of production. I daresay that I voice the experience of every man in this room when I say that the reduction in the selling price of your product is in no way analogous to the reduction in your cost. I have heard it said that selling prices in some instances have been reduced fifty per cent. If that be true, it may be possible that the prices that have suffered this great decline were a little higher than they need to have been; though I have yet to find anybody in the box business who could be charged with profiteering, but it may be that some of us had greater profits than others and greater than might be justified, but I am sure it is true that the cost of production has not in any measure declined with the cut in selling price brought on by competition and by the general sentiment of the buying public that everything must be cheaper. When a manufacturing industry, when a user of boxes, a consumer of boxes, a shipper, is confronted with the necessity of reducing the price of his product about the first thing he looks to is a reduction in the cost of his package. I have studied the situation to some extent and I have observed the experience, the tendency in this direction, and I believe it is quite generally true that the cost of the package is one of the first things that a shipper endeavors to reduce in order to get the cost of his product down.

Primarily the cost of a shipping container is an expense item. Everything else that goes into a manufactured product is no doubt figured as a part of the basic or elemental cost of that product and some provision is made by all manufacturers in various lines for that, but the average shipper rather lumps the cost of his package. There may be exceptions to that, but they look upon it as an item of overhead, not an element that enters the constructive cost but just that general term overhead that applies to all the evils of every business, and I suppose the box business is burdened to it to a greater extent than almost any other industries our hopes for the future are all overhead.

Values Should Not Be Sacrificed

Therefore, you find a tendency to reduce the cost of packages accentuated more than any other product, and we are the very first industry, perhaps, to be confronted with this demand. The result has been that we are about the first industry to yield. Notwithstanding the National Association and the various local associations and the various attempts that have been made to stabilize our product, I know of no industry that is more easily led aside from recognition of the cost of our product than the business that we are all engaged in. You always find somebody who is willing to sell his product at the buyer's price, at what the buyer tells him his competitor will furnish it for. I am not saying this critically, and if it be true, it perhaps applies to me as much as to any of you gentlemen, but that is the tendency and we must recognize it, a tendency to disregard costs and sell our goods at whatever price we can get, an attempt to reduce our stock of raw material, an attempt to keep our factories operating by making a price that we know will lose us money. Ordinarily such a theory or such a condition should be discouraged, and is ridiculous in a way, but we have been passing through a period that has been ridiculous, if I may use the word, it has at least been extreme, and we are obliged to do many things which, taken separately and apart, might seem foolish or ridiculous but which when considered in connection with the whole may, after all, be reasonable.

(Continued in May issue)

Hemlock Suitable For Butter Boxes

A test to determine the suitability of various kinds of wood for butter containers, made by the Dairy Division, Department of Agriculture, Washington, D.C., showed that hemlock may be used for butter containers without imparting to the butter sufficient woody flavor to be commercially objectionable.

The butter used in the test was made from unripened, pasteurized sweet cream. Four boxes each of all kinds of wood were used. These boxes contained about two pounds of butter. One of each was paraffined. All were lined with parchment paper. The boxes were placed in a refrigerator and a temperature varying from 34 to 40 degrees Fahrenheit maintained for ten days. The boxes were then removed and the surface examined for woody flavors. The judges were M. A. A. Sonderguard, G. R. Campbell, C. E. Newlander, William White, all of the Dairy Division, and R. K. Helpehnstine, of the forest service. "Our tentative conclusions," they reported, "are that hemlock, cypress and Sitka spruce may be used for butter containers without imparting to the butter sufficient woody flavor to be commercially objectionable."

Butter packages used by the trade are white ash tubs, white spruce tubs, yellow poplar boxes and to a small extent birch boxes.

A summary of the comments by the judges follows:

"Yellow poplar, paraffined, degrees of woody flavor very slight, not commercially objectionable but more pronounced than the white spruce and red gum; unparaffined, flavor little greater than on paraffined. Probably not commercially objectionable.

"White ash, paraffined, flavor very slight; not commercially objectionable. Unparaffined, very slight, not commercially objectionable.

"Hemlock, paraffined, very slight, not commercially objectionable. Unparaffined, greater than the paraffined, similar to unparaffined yellow poplar.

"Yellow pine, paraffined, same degree as yellow poplar unparaffined. Unparaffined, medium.

"Cypress, paraffined, flavor very slight, same as in red gum. Unparaffined, very strong, but not as bad as western yellow pine.

"Red gum, paraffined, none. Unparaffined, very slight but slightly stronger than white spruce.

"White pine, paraffined, medium. Unparaffined, medium.

"Cottonwood, paraffined, none. Unparaffined, very slight and not enough to be commercially objectionable.

"White spruce, paraffined, none. Unparaffined, very slight and not commercially objectionable."

Open belts without any guard around them should be considered as death traps. Do not wait until the factory inspector warns you. See that neither you nor your workpeople run the risk of being caught by a quickly-moving belt.

Greatest Strength Element in Boxes

Increase in Number of Nails Makes Stronger Container—Boxes Designed for Ease in Handling—Other Points to Consider

NAILS

ACTUAL TESTS ON APPLE BOXES SHOW:

5 nails per nailing edge withstand 50% more than 4 nails

6 nails per nailing edge withstand 100% more than 4 nails

Poor nailing has cost you money in the past
Good nailing can save you money in the future

YOU CAN'T AFFORD NOT TO NAIL BETTER

8 nails more per 100 boxes costs 15c

16 nails more per 100 boxes costs 30c

THE BEST APPLE CONTAINER

A Dry, Pine Box Properly Nailed

BOX BUREAU

Western Pine Manufacturers' Association

Leaflet by Western Pine Manufacturers' Association which members are using with correspondence and inserting with shipments of shooks.

When it is realized that the packing and crating business used up about one-eighth of all the timber cut in the United States last year we begin to realize what a factor boxing and crating is in our national business. It took 4,500,000,000 board feet in 1918, which is five times as much as was used by all American furniture makers and 25 times as much as the shipbuilders. It used practically every kind of wood from yellow pine, white pine and Douglas fir, the three leaders, down through gum, poplar, birch, maple, hickory and the rest to 524,000 feet of cucumber (of the magnolia, not vegetable variety), 170,000 feet of cherry, 13,000 feet of mahogany and 3,500 feet of yucca.

When a single American company spends $14,000,000 for wood to be used in packing and crating only, not to mention the cost of the millions of nails, the 700 miles of iron strap, 20,000,000 square feet of wrapping paper, water-proof cloth, together with screening, string, screws, anti-rust compound and all the other material necessary to proper packing of goods for shipments, it is evident that packing is a subject that industry must study closely for flaws and waste.

The fact that many a manufacturer is doing so is evidenced from the number of organizations which have adopted standard sizes and shapes of boxes, standard ways of putting goods into those boxes so that the centres of gravity shall be so located that the box will "handle" with the greatest ease and ride with the least danger to the contents.

Nowadays a box isn't just made. It is a carefully designed container, over whose corner construction and relative strength of pieces and spacings between nails, some engineer has labored long. The laboratory idea in box testing is fostered by the United States Forest Products Laboratory at Madison, Wis., where annually thousands of boxes and cases full of goods are strained and squeezed and dropped and tumbled mercilessly in huge "squirrel cage" testing drums so that experts can watch them slowly go to smash, noting exactly how and why and where.

Greatest Strength in Nailing

The testing laboratories have discovered, for instance, that the greatest strength element in the average container is in the nailing, rather than the thickness of its wood, though naturally the end pieces of any box must be strong. They have shown that about 98 per cent. of the shippers of the country do not use enough nails of the right sort driven at the right angle. The American Society for Testing Materials, at its recent convention, lined up with the Forest Products Laboratory favoring more nails.

A standard plan for nailing up a box was worked out thus: In domestic boxes for 6-penny nails or smaller, the spacing when driven into side grain of the end of a box should be 2 inches apart and when driven into end grain, 1¾. This spacing should increase ¼ of an inch for each larger penny. In export boxes, nails should be ½ inch closer.

And any old kind of a nail will not do your scientific packer. Small heads will pull through wood. If the head is a shade too thin it breaks. Smooth or even barbed nails will not stand the strain which cement-coated nails endure. A thick nail a trifle short pulls loose. A long, slim nail will break between the boards with the weaving of the box and so on. The nails must be right and driven correctly, else the box might about as well be tied up with string.

Box Material Must be Carefully Handled

Important as is nailing, it is also essential that the lumber in a box be properly treated before it goes into use. The matters of moisture content and time of storage before use are vital. Moreover, every land must be studied carefully and the packing made to fit the country. For instance, goods going to the West Coast of South America must be in smaller units than those going to the East Coast because of the poorer facilities and fewer railroads of the west side. Landing goods at Chilean ports mean taking them off in lighters and if those goods happen to be electrical machinery going up into the mountains, they must be in small enough packages so as to be easily transferred into the lighter without banging through the bottom if a lighter happens to be rising and falling with the sea, and they must not exceed 170-pound units for burros or 350 pounds for mules if they are to be toted into the hills.

Furthermore, the shipments must withstand all sorts of weather travelling from temperate New York, let us say, down across the humid sweltering Carribbean Sea, through the Panama Canal and the salt spray of a Chilean beach, up into the snows of Andean Peaks, with perhaps a few weeks of exposure to the

wind and rain lying somewhere in the open, before it is unpacked.

Careful studies of packing of products have reduced the cubical contents of shipments to an extent which not only cuts freight charges materially, enabling a shipper to sell more advantageously in foreign lands, but often saves cargo space for the other fellow's use. Proper packing also aids in combating theivery. If a case is held by cement-coated nails, its strength is increased at least 100 per cent, and if the ends of wire or steel bands are sealed by the most approved methods, then a pilferer has a discouraging job of opening a case and closing it again without leaving traces.

Savings Indicated by Laboratory Tests

Freight, Cost and Safety Conserved by Scientific Investigation of Boxes Made of Different Thicknesses of Lumber and of Various Types of Construction—Results of One Series of Tests

Not every plant manager who uses boxes nor every manufacturer of boxes is a convert to the practical application of laboratory tests to box problems, and that is the man who should read this report.

Some recent laboratory tests indicate the extent to which savings can be effected in the average shipping room by application of practical laboratory tests. Very rarely is any investigation made which does not show a considerable saving over the packing and shipping methods in general use by the company.

The report as given below is one taken at random from many tests, and demonstrates very definitely just what can be done.

Thirty boxes, all of the same dimensions, viz., 12⅝ in. x 12⅝ in. x 9¾ in. (inside measurements) were tested. The ends of all boxes were alike, being made of 13/16 in. Western white pine, with cleats 13/16 in. x 2 in.; the object of these tests being to determine the effect on the box strength of varying the thickness of sides, top and bottom. (All sides, tops and bottoms made of Western white pine). The boxes were divided into six groups, as follows:

Five were of 13/16 in. material.
Five were of ⅝ in. material.
Five were of ½ in. material.
Five were of ⅜ in. material.
Five were of 5/16 in. material.
Five were of ¼ in. material.

The size and number of nails used in all boxes, as well as the contents, were identical. These boxes were tested in a revolving drum, each box being tested separately and removed only after it was broken and the contents were no longer protected.

The results, as shown by these tests, indicates the average number of drops to break the different sizes.

13/16" boxes stood 112 drops equalling 100%
⅝" boxes stood 253 drops equalling 223%
½" boxes stood 187 drops equalling 167%
⅜" boxes stood 32 drops equalling 28%
5/16" boxes stood 21 drops equalling 19%
¼" boxes stood 20 drops equalling 18%

Granting that the users havet obtained perfect satisfaction from a 13/16 in. box, it is obvious from the foregoing data that the material in sides, tops and bottoms could be cut to ½ in. thickness, instead of 13/16 in., and yet the strength of the box would have been 167% as against 100%. However, if the material used in the sides, tops and bottoms had been cut to ⅜ in. in thickness, the box would have been absolutely out of the question and weakened beyond practicability.

After this series of tests had been completed, similar boxes were tested with one metal strap around the centre. These tests show the following results:

13/16" without straps 112 drops or 100%
½" with one strap 936 drops or 835%
⅜" with one strap 323 drops or 288%
5/16" with one strap 121 drops or 108%

The latter tests indicate that the box could have been still further lightened, as shown by the first tests, and that by the simple addition of one strap, using 5/16 in. thickness sides, top and bottom, would have resulted in a stronger box than the heavy 13/16 in. material provided.

Getting down to dollars and cents in the matter, using lumber values effective at the time the tests were made, the 13/16 in. box would have cost approximately 55c, while the box of ½ in. material would have cost approximately 40c, a saving of approximately 25%. In weight, the difference amounts to 3¾ pounds, which, taking into account an average freight rate for any commodity of $1.00, means a saving in freight of 3¾c additional. In other words, a total saving in this instance, resulting from application of scientific box tests, was approximately 18¾c.

So many factors, such as species of lumber used, size of box, weight and shape of contents, also the varying conditions of transportation, and the methods of packing and storage have a bearing on the subject that only a trained box engineer can be safely charged with the designing and the specifying of box construction. —"Boxes."

Million Boxes Without Serious Accident

If they had spread their lumber out on the surface of the ground, plank by plank, they would have had a board walk more than 1,500 miles long. But they didn't do that—they took more than 8,000,000 feet of lumber and made a million and a half boxes and nearly 87,000 barrels out of it. What is more, they did it all without a single lost time accident in eleven months of work.

This noteworthy record was made by the box factory department of the Swift & Company plant at the Union Stock Yards at South St. Paul, Minn. The following figures for the period from February 1 to December 31, 1920, speak for themselves.

Average No. of men employed	125
Lost time due to accidents	0
Boxes manufactured	1,591,243
Barrels manufactured	86,779
Lumber used	8,243,761 feet
Nails used	6,831 kegs

In the corresponding period of 1919 this department had 49 lost time accidents.

Machinery & Equipment

Yates Edge Sander

There are many different kinds of sanders, each designed for a special purpose or particular class of work. The one shown in the accompanying illustration is an edge sander, the product of the P. B. Yates Machine Co., Limited, Hamilton, Ont. This machine is of rigid construction, having a heavy cast-in-one piece base. It is fitted with two adjustable tables, a front and an end table. The front table can be dropped to form an angle not exceeding 30°. The sand drums are 10 in. x 14 in. and 10½ in. x 4 in. and carry a 10 in. sand bolt. Oscillation is needed in order to procure a fine, even finish; removing the ridges and scratches which would otherwise appear when the belt is run straight, without the employment of oscillation. This is secured by the employment of an eccentric and the locomotive link principle. Coil springs surrounding the driven spindle absorb the shock incident to change of direction and a smooth, easy oscillation is the result. Ball bearings are placed so as to prevent excessive friction. A tightener or idler is attached to the rear of the machine to maintain a suitable tension on the belt. This is locked in position by a handled set screw. Just back of the front table is a perpendicular back to support the sand belt when work is pressed against it. By means of a hand screw this back can be adjusted to accommodate the work. The drive pulleys are placed in the base, thus economizing in floor space, yet they are readily accessible, if necessary. Special drums and forms can be had with which to sand special patterns and designs.

Among the indigenous industries that are now having a boom is that of basket making by Indians along the Mission River, B.C. The baskets are made from the wood of the mountain ash tree, which is split and then pounded out until thin strips are obtained, about the width and thickness of tape, from which the Indian women weave extremely beautiful basket ware.

Pulley with Interchangeable Rim

A new split pulley is described in an interesting catalog received from the Canadian S K F Co. Toronto. This new pulley, which is of metal, has several features which should commend it to practical men. One of the most radical departures from ordinary design is that both the bushings and rims are interchangeable. A standard cast-iron spider, in various diameters, has been adopted, and rims and bushing may be secured to suit the shaft and belting. The rims are made of steel, of a quality to withstand a high tensile strength and the ends are flanged to receive the stretching bolts. When the rim is securely

New Yates S. 2 edge sander.

attached to the spider the latter is under compression, permitting the pulley to be run at an unusually high speed. The pulleys are carefully balanced and their use should tend to reduce vibration in shaft or machine. No keys are required, the spider, with bushings inserted, being firmly attached to the shaft, and then the balance weight and rim added. The rims run from 3 to 16 inches in width and being interchangeable, if for any reason the width of the face of the pulley is not suitable, a new rim may be attached without removing spider or buying a new pulley.

Efficient Vertical Router

The new type of vertical router is shown in the accompanying illustration. This machine was designed as a piece of production equipment for automobile, aeroplane and furniture-manufacturing plants. It is made with or without the floating table and may be had for either belt or motor drive. All the bearings are ball bearing and the machine is massive and powerful, containing all the refinements needed for intensive quantity production. The vertical adjustment of the table is 8 in., while the cutter has a vertical movement which is adjustable from 0 to 2½ in. The spindle is capable of swinging a cutter 6 in. in diameter. The distance from centre of spindle to base of column is 27 in.

Three-Ply Construction in Motor Car

A new motor car is being introduced by the Parenti Motors Corporation of Buffalo, N.Y. The chief innovation in this car is that the body is constructed of plywood and that the wheels have plywood discs instead of spokes. This construction results in a very light car and permits of some startling changes in design to be made. In this particular car the chassis is combined with the body and each wheel is supported by a cantilever spring, doing away with both front and rear axles.

A cheap coal is not one which gives you quantity for a certain sum of money, but which will surrender the greatest amount of heat.

Machines are now being made with every moving part having ball bearings.

New type vertical router.

Upholstering and Trimming

Working Covering to Best Advantage

Many Problems Presented in Cutting Upholstering Material—Proper Planning will Conserve Cloth—Wide Variation in Designs

For the planning and cutting of upholstery materials a cutting board is necessary. Its dimensions should be adapted to the amount of space available, but it should not be less than 7 ft. long by 4 ft. 6 in. wide. The top should be of hardwood to stand the continual hammerings of the pritchawl occasioned by the marking out of various materials. The upholstery cutter needs but few tools. The chief of these is the shears, which should be a well-made pair of French pattern, slightly larger than those used by the upholsterer. Hammer, yard stick, tape measure, pritchawl, straight edge, a large square, French chalks of various colors, blue pencil, and pins, complete the list. An upholsterer cannot be regarded as a master of his craft unless he is able to plan and cut covering materials. says Frederick Palmer in "Practical Upholstering." In large factories where much repetition work is done the learner has little opportunity of gaining experience in measuring and cutting, and may even attain the status of a journeyman without much knowledge of this side of his craft.

Upholstery fabrics are, as a rule, expensive, and to use a piece of material 3 yards in length when by skilful cutting 2¾ yards would suffice, makes a considerable difference in cost. Even when an exact estimate of the yardage of material required has been obtained, waste may occur on account of incorrect planning.

Pattern Should Be Studied

Much depends on the material, a small conventional spot pattern being easier to plan and cut than a bolder design with a large medallion centre or evenly-balanced floral motif which makes it necessary for each cut to be treated with due regard to the nature of the pattern. Figured fabrics are more wasteful in cutting than plain or self-colored materials, because the pattern requires matching. Centre patterns on some designs are repeated at inconvenient distances so that waste is unavoidable. Much practice is necessary to become a skilled cutter, and it is a safe rule to plan out the various pieces carefully before commencing to cut, but as has been pointed out, plain materials, small powdered or spot patterns, require less planning than floral or figured fabrics.

If the upholsterer starts to cut before planning, failure is usually the result, and to this must be added waste of time and unnecessary seaming. Before making calculations the cutter must be conversant with the width of the material he is using, as accurate quantities and estimates cannot be given unless the width of the material to be used is known.

Various upholstery fabrics are now generally made in definite widths, and in specifying cretonne (single or double width), tapestry, velvet moquette or brocade it would hardly be necessary to detail the exact number of inches in the width. Fabrics for upholstery are now woven in a convenient size for cutting, and vary from 48 in. to 52 in. wide. Velvets are largely used, and the inconvenient 24 in. width has become old-fashioned. Single width cretonne generally measures 30 in. wide, while double width cretonne is woven the same width as tapestry. Moquettes, brocades, silks, damasks and various kinds of artificial leather are all made in widths to suit the convenience of the upholsterer. Corduroys follow cretonne as regards width, both single and double, and there are numerous other materials obtainable in tapestry widths. It should be noted that a double width material usually cuts up more economically than single width.

Keep Down Number of Seams

Seams constitute a bugbear both to the upholsterer and customer if they are too numerous or placed in such positions as to offend the eye, and seams which are objectionable in appearance or indiscriminately placed give rise to many complaints. The aim of the cutter, therefore, should be to reduce the number of seams to a minimum. In some materials the joins show very distinctly, while in others they are scarcely visible. In patterned fabrics of small set design or foliage the joins are not so conspicuous as in those where the fabric is plain. Velvets need great care in planning, especially self-colored weaves. Moquettes also present difficulties, as they are of a stiffer nature than velvet, and unless the join is to some extent hidden by the pattern, it is difficult to prevent a clumsy appearance however carefully they are sewn and pressed. In stuff-over work seams are unavoidable, but the skill of the cutter lies in so planning the work that they are neither numerous nor conspicuous.

An insufficient quantity of material is the general cause of too many seams; a lesser quantity may suffice, though this economy is practised to the ultimate detriment of the work and at the risk of complaints from customers, while the upholsterer himself is hampered through a lack of pieces for joining and making up. It is true that the fabric for covering a piece of upholstery is a most expensive item, and economy is necessary; but it is folly when finishing the work to spoil its appearance by not allowing enough material. Another argument against undue economy as regards material is that it causes tight coverings which, from the upholsterers point of view, are difficult to deal with and require much skill and care in planning out; this means that additional time is required, and when the work has to be finished in a given number of hours, the period set apart for the actual covering of the piece is curtailed, to the detriment of this most essential process. Seams are not so prominent when they are matched, and the skilful upholsterer can take advantage of the pattern to hide the seams or camouflage them—to use a modern word. In high-class work the joins are always matched, and the quantity of material allowed is governed by the pattern. The length of a repeat in a patterned material may vary from a few inches to about a yard, and it is frequently a matter of great difficulty to obtain matches for all

parts of the work. In such cases the inside of the work should be studied first where the seams to be matched are more conspicuous than those on the outside.

Medallion and Foliage Designs

To attempt cutting haphazard on such fabrics as medallion or foliage designs would be to ask for disaster. A medallion design to be used to advantage and with the best effect must be carefully planned before cutting. The positions which the medallions will ultimately occupy are important and best obtained while the work is on the floor level. In an ordinary divan a medallion would be necessary for the centre of the back, another for the seat, and two more for the arms.

A foliage pattern, and is one that, generally speaking, allows the cutter plenty of liberty. The design being of an all-over character, the failure to match exactly is not so apparent. Foliage designs are economical in cutting, but more suitable in style for massive, heavy stuffovers than for light, graceful work.

(Continued in May issue)

Discuss Sales Tax

Mark Rowe of the Canada Furniture Manufacturers, Limited, Woodstock, Ont., and Wm. Cawkell, secretary of the Furniture Manufacturers' Association, Toronto, represented the furniture industry at a joint meeting of representatives of the Canadian Manufacturers' Association, the Retail Merchants' Association and the Canadian Credit Men's Trust Association, which was held in Toronto on March 30th and 31st, to discuss the present and proposed methods of Dominion Government taxation; to define the words "manufacturer," "wholesaler" and "retailer," and to study the Made-in-Canada Campaign.

The question of Dominion Government taxation and the definition of the different terms were thoroughly discussed, many of the better-known business men and manufacturers offering their views. The following proposals were brought in and unanimously adopted by those present: (11 That the business profits war tax act shall not be re-enacted; (2) That the income war tax act, affecting corporations shall be repealed; (3) That the present excise manufacturing tax on confectionery shall be abolished; (4) That the present sales tax be adjusted so as to provide the additional revenue needed by the Dominion Government.

As a suggestion to the Finance Minister, the following definitions of gradations of trade were endorsed:—

"Manufacturers"—Persons, firms or corporations who produce, manufacture, process or assemble articles or materials into saleable articles or materials for sale. (This it was pointed out would not interfer with an appeal for exemption from merchant tailors, milliners and others engaged in lines of a like nature.)

"Wholesalers" — For the purpose of this act a wholesaler shall be construed as being a person, firm or corporation who assemble in his warehouse a full line of goods carried in his special branch of business. and distributes them to the trade, but who has no retail counter and who does not sell to the consumer.

"Jobbers"—Persons, firms or corporations who sell for the purpose of re-sale and who have no retail counter and do not sell to the consumer.

"Retailers"—Persons, firms or corporations who sell to the user or consumer or who have a retail store or counter. This classification to include in addition to their classification as manufacturer or wholesaler the departments or agencies of such manufacturers or wholesalers who have such departments or agencies through which sales are made to the user or consumer.

The "Made-in-Canada" propaganda came in for a considerable amount of discussion in which a large number of those present took part. The following resolution was finally adopted. That this conference suggest to their respective organizations the advisability of recommending to the Government the setting aside of a sum in the budget to be used for a campaign to advertise Made-in-Canada and Made-in-Canada products.

J. A. Banfield, of Winnipeg, president of the Retail Merchants' Association, presided at the meeting, and J. T. Stirrett, of the Canadian Manufacturers' Association, Toronto, acted as secretary.

General Review of Business in U. S.

The Fidelity and Deposit Company of Maryland made an extensive and comprehensive survey of conditions from nine large districts into which, for convenience, the United States was divided. This survey is a review by all business men, prepared with every effort to insure accuracy and based on interviews with bankers, merchants and manufacturers.

A summary of questions and answers is given below. The number in brackets indicates the divisions giving the answer, 9 indicating unanimity:

1. Is there a marked resumption of industrial activity? No (9).
2. Is buying by the public still restricted? Yes (9).
3. Do industrial concerns report continued cancellation of orders? No (9).
4. Have retailers stocked up in expectation of a good spring business? No (9).
5. Have retail prices been reduced in the same proportion as wholesale prices? No (9).
6. Has the cost of living diminished appreciably since last September? Yes (9).
7. Are industrial concerns carrying large amounts of customers' paper? Yes (9).
8. What problem has the greatest bearing on business prosperity Taxation—Railroads (9),
9. Are general transportation conditions good? Yes? (9).
10. Are raw materials plentiful? Yes (9).
11. Have any failures of importance occurred since last September? No (9).
12. Are there any strikes? Yes (2). No (7).
13. Have there been any appreciable wage reductions? Yes (8). No (1).
14. Has the productivity of labor per man increased or decreased since September? Increased (9).
15. Are building operations increasing or decreasing? Decreasing (2). Increasing (7).
16. Is there need of building construction and in what class? Yes, low-priced dwellings (9).
17. Is sentiment favorable to building operations at present cost? No (9).
18. Are banks supplied with funds to lend? Yes (8). No (1).
19. Over a six months' period have deposits increased or decreased? Decreased (7). Increased (2).
20. Have corporation accounts increased or decreased? Decreased (9).
21. Have savings accounts increased or decreased? Increased (4). Decreased (5).

22. Do local indications point to increase or lessened government tax revenue this year? Lessened (9).
23. Is a higher tariff desired? Yes (5). No (4).
24. Have farmers disposed of all their last season's crops? No (9).
25. What is crop outlook for this season? Fair (4). Good (5).
26. Are farmers withholding payment of bills? No (2). Yes (7).
28. Is there a demand for farms this year by renters? No (6). Yes (3).
29. Is condition of sheep and cattle men fair or poor? Fair (7). Poor (2).
30. Is there noticeable movement of men to farms from industries? No (9).
31. Is there a noticeable increase in crime over last September? No (4). Yes (5).
32. Should excess profit tax be abolished? Yes (9).
33. What substitute would you favor? Sales tax (9).
34. What is the big local question? Shortage of houses (6). Taxation (8). Labor adjustment (4).
35. What is the big national question? Taxation (8). Tariff (2). Peace settlement (3).

Practical Upholstery

An interesting and practical work covering upholstering in all its branches has recently been issued by Benn Brothers, Limited, London, England, under the title, "Practical Upholstering and the Cutting of Loose Covers." The author, Frederick Palmer, is an upholsterer of wide experience and an enthusiastic follower of this craft. This book, which deals with the different operations and different classes of work in a clear, practical manner, is illustrated with over 400 sketches, showing various phases of the work. It differs from many of the works on this subject, which have been published, in that it is neither amateurish or elementary but was prepared by a practical man for practical men. In his introduction the author remarks that upholstery depends largely on tradition. There is no trade which has been so little affected by modern machinery. It has always been and remains a handicraft, and moreover, one in which a high degree of skill and deftness is needed. In "Practical Upholstery" it has been my task to lay bare all the inward parts with the frame or sketches and building up the structure process by process until the final covering. It is a book that should appeal to all practical, progressive upholsterers.

New Zealand Box Trade

New Zealand offers a potential market for Canadian-made boxes and box shooks. These would be used chiefly for packing butter for export and would necessarily be made of some wood which would not taint the contents in any way. The price would be another factor, for it would be necessary to compete with certain New Zealand boxmakers. However, if Canadian box men can produce a product from suitable wood, at a favorable price, a large volume of business could be secured.

A suggestion box with a good reward for workable ideas will help to encourage everyone to take an interest in their firm.

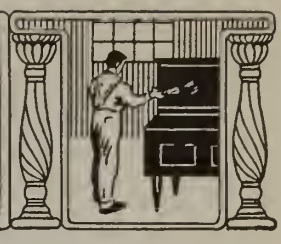
THE FINISHING ROOM



Drying of Varnish in Special Kilns

Temperature and Circulation Prime Essentials—All Factors Subject to Rigid Control—Like Dry Kiln, Intelligent Operation Required for Best Results

By C. A. Cutler*

(Concluded from March issue)

Consider the reverse action when the heated and conditioned air is introduced into the top of the kiln and does its work on its downward course. The air will spread out evenly at the top of the kiln until it comes into contact with a cooler surface. As quickly as it gives up any of its heat it falls to a lower level and is replaced by the continuous supply of warmer air coming from the heater. The cooler it gets, the more rapidly it falls. The more rapidly it falls the sooner it returns to the heater. It is never opposed in its natural path. If one part of the kiln was loaded with material of a lower initial temperature than the other parts, the circulation would be most rapid at that point until the temperature had been evened up. The tendency would be to create an even temperature in all parts of the kiln and no piece would ever be heated to a greater temperature than the controlled incoming air. By introducing the heated air at the top and at one side of the kiln, and taking the air out at the bottom on the same side, the air in the kiln has enough of a lateral motion to move freely between parallel horizontal surfaces causing them to dry more rapidly and more evenly than would be the case if the heated air was rising up through the materials.

Securing Even Temperature

Suppose the air on the floor line is drawn into a fan and then heated and delivered again into the top of the kiln. The mechanical assistance of the fan will increase the speed so that the air will reach the floor line at a temperature only a few degrees cooler than when it entered at the top of the kiln. The air coming into the kiln must not have a speed that could be called even a breeze. It is necessary that the intake and discharge of air be of great volume but at low speed, otherwise there would be a direct blast of air that woud carry dust to the varnish surfaces and a disturbance of the natural currents that would result in uneven distribution of the drying air.

If the same air was circulated continuously it would soon become loaded with turpentine and naphtha fumes which would delay the oxidation of the oil in the varnish. Not only would the fumes occupy the space which otherwise would contain air and thus reduce the available amount of oxygen but probably the small amount present under such circumstances would be largely taken up by the fumes themselves instead of by the oil.

To rid the kiln of these fumes, some sort of ventilation must be provided. The most rapid oxidizing conditions require that almost the entire proportion of oxygen that is present in fresh air be present at all times in the kiln. The more rapid the circulation the less amount of fresh air is needed per circuit but the number of cubic feet of air per minute needed for a given quantity af varnish is constant and unless that amount is provided the fastest drying will not be attained. Every cubic foot of air taken out of the kiln requires an equal amount to be admitted to the kiln but the cost of heating increases with each additional cubic foot of air admitted, so it is important to have accurate control of the ventilation system. That system that will provide the most fresh air for the least loss of heat is, of course, the most economical. There is at least one system that will maintain fresh air inside the kiln with no direct exchange of air. This, of course, results in a great saving of heating expense.

The control of the heating system has not been discussed until this time because it is dependent upon circulation and ventilation. As has been shown, radiant heat does not distribute evenly and so must be guarded against. The action of heated air has been described and it is this medium that is best suited for the purpose. Granted that a circulation of heated air is to be used, then the next problem is, what is to be the method of heating this air, because control of the heating means depends upon what kind of a heater is to be used.

Deciding on Type of Heater

When a rapid circulation of air has been established the maintenance of a given temperature is only a question of raising a given number of cubic feet of air per minute a comparatively few degrees. If, as described before, the air of the floor line is very nearly the same temperature as the air entering at the top of the kiln, then the problem is the raising of a large quantity of air very rapidly a few degrees. The heater best suited for this purpose is not a pipe coil. Pipe is most efficient when the air moves past or through it very slowly. A cast iron radiator is very much better suited because the air is so much longer in contact with the heating surface and the roughness of the surface causes slight eddies so that more air actually touches the heating surface than if it was smooth. Air is one of the best non-conductors of heat so that in the cast of a slow circulation a layer of air lying next to the surface of the heater will become quite hot before the air a short distance away has been heated at all. The usual effect of heaters is to heat a small quantity of air to a high degree and by mixing it with a larger quantity heat it all to a lesser degree. It is more efficient to heat a large quantity of rapidly-moving air to a slight degree so the heaters should be of relatively great surface, rough and open enough to allow a free and rapid flow of air and yet keep the air in contact long enough to heat it to the desired degree. This is on the same principle that it is easier to pick ten dozen ears of corn from a field containing one hundred dozen than it is to pick ten dozen ears

*President Cutler Desk Co., manufacturers Cutler dry kilns.

from a field containing only ten dozen ears. The higher the efficiency required to do a given thing the more difficult it becomes.

Absolute Control Essential

The control of a large heating surface is more difficult than of a small surface, and in this case not only must the surface be large but it must be so large that it will be able to furnish quickly all the heat needed to raise quickly the temperature of all the material in the kiln as well as the air in the kiln and, therefore, larger than needed for merely maintaining the desired temperature. The result is that during the greater part of the time the heat regulator is admitting only a small amount of steam. The steam distribution must be such that when heat is needed that all of the heater will be affected evenly by any small amount of steam admitted. This is, of course, a matter of piping, but it must be carefully laid out or uneven heating will result, even if all other conditions are correct.

Now, supposing all these elements have been properly combined and the best possible kiln has been built, there is still missing one very important item, an intelligent operator. The finest made Swiss watch will not give good service if it is not given good care and treatment. An apparatus of so complicated requirements is usually best obtained from some concern who have made a careful study of the problem so that an understanding of the general principles is sufficient for the average user, but the factory manager is missing a "good bet" when he does not insist on having every day a record of the kiln performances. These records should be part of his production system as they are or can provide definite information as to the stock moving through the finishing process, but in addition to this it will keep the operator from allowing the kilns, for which the firm paid their perfectly good money, from getting into a condition of nearly uselessness. This is not a reflection on the kiln but it is entirely a matter of maintenance and operation. The instant that the records do not show the results that are equal to the best performance the kilns are capable of, an investigation should be made to determine the reason. A machine that was not producing up to its rated capacity would be turned over to the millwright gang, and a kiln is entitled to the same care. A good kiln is not a "hot box." It is a carefully designed piece of apparatus that will give an excellent return on the investment if it is given the same consideration that similar apparatus in other parts of the plant is given.

Finishing Close Grained Hardwoods

Smooth Surface First Requisite—Suggestions for Different Woods—Much Depends on Skill and Knowledge of Operator

By Lyman Whiting

Satisfactory methods are only produced after long years of experience—through failures as well as successes. It is the knowledge gained from these ups and downs that demonstrates the best methods of finishing hardwoods.

The secret of successful finishing requires at the start a smooth surface which is entirely free from dust and markings, even to pencil or finger-marks. Unless a more or less colored finish is given, the slightest marks will show up in the finished surface, so attention paid to securing a smooth, bright, clean surface upon which to work will insure the finest results.

For a colorless finish, apply a first coater of white or bleached shellac thinned down pretty well with denatured alcohol. After this, the nail-holes or other small openings should be carefully puttied up with white lead, tinted with a little yellow ochre or chrome yellow. Be very careful that the putty matches the wood, but it should be slightly darkened, for the wood has a tendency to grow dark with the passing of time, while the putty, as a rule, will retain its original shade;

Sandpapering Important

Be careful that you sandpaper the first coat of shellac with a No. 0 paper, dust off thoroughly and then give a coat of good grade, pale interior finishing varnish, which may be thinned a trifle with turpentine. After this coat has become thoroughly dry, say after two days or so, sandpaper with No. 0 paper and dust off carefully. The intention in this case of sanding is merely to remove the gloss, and steel wool or curled hair may be employed with even better results than the sandpaper.

After this, apply a coat of the same varnish as previously mentioned, but use this as it comes directly from the can, without thinning as in the first coat. This latter one may be rubbed or two or three more coats may be applied, according to the quality of the work you have in hand—a rubbed finish demanding three coats of varnish, the last coat being rubbed with flour pumice stone and water or oil, then finish by polishing in the usual manner.

Another method is to flow on the last coat and leave it, which produces a fine luster finish, providing a high quality of varnish has been employed. Such a finish as this shows the wood in a most attractive form, and yet a dull rubbed effect is preferred by many, and looks well.

When finishing hard, Georgia or yellow pine, all three of which are about the same, only masquerading under different names, they really need no filling, the liquid used being really surfacers rather than fillers. This finishing, of course, all applies to the very light colored woods, and we can go on to the darker grades, cherry being one of them. This is usually finished in the natural, as it is of itself very attractive, having unusually pretty grain. But as a rule cherry is stained and finished to match other and more expensive lumber—mahogany, perhaps, being the most popular. For this a burnt sienna stain is generally employed, but aniline stain of rich mahogany should be used when deep and richer color effects are desired.

Overcoming Dark Streaks

Above all woods, cherry is one that must be made perfectly smooth and neat if the best work is to be expected. This, too, must be free from all marks and the surface perfectly clean, it being a close-grained wood which requires only a surface filling. We believe that shellac is the best material for this purpose.

Many rich oil stain and water stain are apt to leave a lap, which, of course, mars the beauty of the

finished work. If this does occur, it may be remedied by wetting the edge of the lap, and also that of the adjoining or unstained portion of the surface.

Another very beautiful hardwood which can be finished in the natural is quarter-sawed sycamore. I do not believe that any other wood has anything to compare with the beautiful grain of the quarter-sawed sycamore. It has wonderful markings, and its color is also peculiar to itself. When finished in the natural, there is hardly another hardwood which can surpass it for beauty.

Quarter-Cut Gives Best Effect

As a rule, any quarter-sawed wood gives a better effect than that which has been plain sawed, but both have some color, although not, of course, the same markings. Sycamore, as a rule, should not be stained, but finished up in the natural, following the same process that you would in finishing maple, that is, using a thin white shellac and varnish.

Another very handsome wood is beech, and it may be finished in the natural or stained with equally satisfactory results. Either mahogany, cherry or walnut stain will give a good color effect on beechwood. If finished in the natural, we believe it should be given a full gloss.

The quarter-sawed redwood gives perhaps the most attractive finish, and there is also a very handsome curly variety.

We believe that beech, birch and maple shauld be finished with a water stain, that is, wherever a natural finish is desired, although there are some finishers in our best factories that prefer a spirit or chemical oil stain. All this largely depends upon the skill of the workman. The woods just mentioned are close grained, have delicate markings and do not take stain readily unless they are transparent. The heavier stains you will note are apt to obscure the grain.

If you are employing a pigment stain, be sure that you wipe it off well in order that the beautiful grain may not be hidden.

Birch Takes Nice Finish

Red and white birch, the former having a sort of curly growth, are very fine. Birch may be stained to imitate several other woods, although when finished in the natural it is quite satisfactory. There are some finishers who claim that this wood is ruined by staining, but like so many other points, much depends upon the finisher.

There is really no filling required for close grained woods, yet in order that the action of water may be counteracted in the stain upon the grain, some prefer to use a paste filler. In this case it should be tinted to suit the color that you desire in the finish. Five pounds of paste filler may be made right for filling with the addition of a gallon of liquid. After the filling, the job should be allowed to stand twenty-four hours, then sandpaper well and apply a priming coat thinned to match the finished color, using for this purpose a lake pigment, and after twenty-four hours sandpaper again and flow on a full coat of high-grade polishing varnish. When allowed to dry, polish up in the usual manner.

Mixing Different Pigments

Golden red, dark red and golden constitute three satisfactory finishes, the gold finish being made from raw and burnt sienna and a very little lemon yellow. These pigments are mixed with first coater, following with a second coat of primer, and finished with polishing varnish. Undoubtedly red and yellow lakes will give a better gold effect. They will show the color tone the same as other pigments mentioned, with the difference that the coloring would be transparent, leaving none of the little flecks of color seen when using the other methods.

Burnt sienna is used in making the light red and the dark red is from burnt sienna slightly darkened with the addition of Vandyke brown. These stains should be thinned considerably with turpentine and sometimes the stains are incorporated with the first coater, the latter method being perhaps the better of the two.

Most finishers have their own plans and methods, but often they can profit by the experience of others. These suggestions are offered in the hope that they may prove of interest to other finishers.—"The Furniture Manufacturer and Artisan."

Reclaiming Waste Material

When ready to use the spraying machine for shellacing, the platform should be thoroughly cleaned. In addition to this one large manufacturer places a large frame at the back of the hood which reaches from the floor to the top of the hood. It is covered with cotton and will catch a lot of gum which together with the scrapings from the platform can be recut with alcohol and used again.

Before using for varnishing, the platform should be thoroughly cleaned. Strips of tin can be placed at the sides of the platform to catch the varnish. To remove the varnish from these strips put them into a tank of benzoin which can be easily constructed for this purpose. This will soften the varnish. The varnish can then easily be removed and with that taken from the platform can be thinned and used for other purposes.

The same practice also holds good for enamels. They can be recut with benzole and used for back or interior case work, etc.

In the staining room the table should be so constructed that all the waste stain will be held on the platform or in a trough around the sides. A hole can be made in the trough or platform from which it can be drawn off, and used again.

Keeping Sprayer Clean

The successful operation of a spraying machine requires that every part be kept in perfect condition, which may be taken to include perfect cleanliness. This is particularly true with reference to the exhaust fan. A little attention in this direction will lessen the wear and tear on the motors and cut down the power bill. To remove varnish, etc., from the fans take a can a little larger than the fan itself so that the fan can be immersed in some good paint remover. It is a good practice to clean all parts, such as fan, vent pipes, hood, etc., at least once a week.

If a good paint remover is not at hand, the following solution will be found satisfactory: 4 ozs. melted wax to which is added 1 gal. alcohol. It is not a bad suggestion to keep a can of this remover at hand and allow the gun or spray head to stand in it when not in use. The hose can be immersed in the same solution but should not be allowed to remain for a period longer than ten minutes. The practice of cleanliness is not only a good habit but adds to the pleasure and enjoyment which one receives from one's work.

Enamelling Presents Problems of Its Own

Special Attention to Each Coat—Judging Qualities of Enamel—Suggestions for Rubbing and Polishing

By R. S. Thorne

Important to a 100% enamelling job is to have the surface in good condition. All cracks, crevices, nicks or indentations should be filled with stick shellac and sanded off. It must be carefully filled with a white base filler, wiped and allowed to dry from 24 to 48 hours. It is then ready for a coat of shellac, which should be very thin, or what is known as a shellac wash. After sanding and dusting the furniture is ready for the first undercoat.

The undercoaters are made from snow-white lithophone ground in specially treated wood oil. Lithophone is an extremely dense pigment and makes an ideal undercoater, one that holds out the finishing coats in full, rich body, producing a finish that leaves nothing to be desired. Allow from 2 to 3 days for each undercoat to dry and sand lightly with fine sandpaper.

Color Undercoat to Match Finish

Two undercoats are usually applied. The first should be thinned with pure spirits of turpentine The second undercoat can be applied as it comes fro the can. If the finish is not white, the first undercoat should be tinted slightly and the second as near as possible to the color desired. An ivory tint is secured by adding chrome yellow. Some vary this by also using a little red or orange.

The furniture is now ready for the first coat of enamel. The enamel should be flowed on thin with a chiselled varnish brush. The brush is of great importance in good enamelling. It should be a good firm-haired bristle brush, preferably a flat hog's hair with a natural point. Soft brushes are not suitable neither are hard ones.

Qualities of Good Enamel

A good enamel should be easy to apply, should not show streaks or brush marks and should set reasonably slow, giving the coating an opportunity to flow out smooth. It could then be touched up several minutes after it is applied without showing streaks. If the enamel does not work freely, add a little t pentine. Where the enamel is pure white or what is known as a sickish white, it is the practice in some finishing rooms to add a small quantity of Pussian Blue or any other good blue. For the first coat of enamel use a mixture of about 2/3 enamel and 1/3 undercoater. This helps to knit the coats closer together.

These are the qualities of a good enamel: Good color and body, free flowing and easy spreading, steady drying and hardening without the loss of lustre. It should produce a porcelain-like finish that does not crack or chip off and is minus any suggestion of blu or pinkish cast.

Obtaining Final Finish

There are three ways in which enamelled furniture can be finished—eggshell. satin and gloss. The eggshell finish is not as satisfactory as the rubbed finish but the appearance will be about the same. If the regular enamel gloss finish is desired, the final enamel coat finishes the job.

A rubbed or satin finish may be obtained by rubbing smooth with powdered pumice stone and rubbing oil or water. An easy way to do this is to use a piece of rubbing felt which has been kept well saturated with the oil and water. Dip it in the pumice stone, rub the surface smooth, and be sure that all dirt o. dust marks have been removed. The enamel should stand from 6 to 7 days before rubbing.

The polished finish may be obtained by polishing with powdered rotten stone and polishing oil or water. It is best to use a soft cloth or cotton waste which has been kept well saturated with oil or water. Dip the cloth in the rottenstone and rub the surface until a high lustre appears. This rubbed finish ought to stand about 24 hours before polishing.

After the polishing it is the practice in some finishing rooms to rub lemon oil over the entire surface. Wipe the oil off with a piece of cheesecloth which has been dampened with alcohol. Too much alcohol will burn and ruin the finish. The safest way is to dip the cloth in alcohol, ring it as hard as possible, open out and swing through the air before using. The rubbing should be done as rapidly as possible. — "Finishing Facts."

"Hardwood Flooring Weeks" Arouse Interest

Hardwood flooring weeks are now becoming quite popular in Ontario. Under the direction of the Seaman-Kent Co., Ltd., of Toronto, in co-operation with local lumber dealers and hardware merchants, demonstrations have been put on recently in Hamilton, Brantford and Chatham. Among the other centres where "hardwood flooring weeks" will be observed in the near future are Sarnia, London and Peterborough. In each city a full-page ad. in a daily paper is taken by all the interests concerned, and suitable premises are engaged by the lumber dealers for display purposes. Much advertising matter in the shape of panels, cutouts and other attractive designs decorate the walls and windows, while the Seaman-Kent Co. provide an expert to give estimates and advice to all inquirers.

In Brantford recently the display premises were crowded with men and women interested in hardwood floors. The hardware dealers put on specially dressed windows, featuring brushes, mops, oils, varnishes, waxes, finishes and other allied lines. Several hundred inquiries were made, and as a result of the recent successful demonstration in the Telephone City the retail lumber merchants there have hundreds of names of prospective customers on their list.

The interest of scores in hardwood flooring has been aroused and the publicity propaganda shows what well-directed effort can do in the line of stimulating business and making people desire more cosy, comfortable and artistic homes and home fittings.

Equipment installed in an odd-shaped building will be best driven by electricity, as this power allows the machines to be placed in any odd corner.

Do not overload your belts; if you do their upkeep will be a very expensive item in your running charges.

Your Product
Finished by

The Aeron Operator

The Aeron operator can become as proficient and as big a factor in cutting costs and improving results in your finishing room, as he has proved himself to be in thousands of other finishing rooms now using the

Aeron Finishing System
Surpasses Brushing

Spray-finishing Equipment

The Aeron operator does his work with greater ease and advantage than a hand-brusher, regardless of size or style of article finished. While the equipment provides for cleaner, more healthful working conditions.

At the same time that his speed of finishing averages 4 or 5 times that of the hand-brush method, the coatings he applies are uniform and of highest consistent quality.

Write and let us show you further the advantage and economy of having your product finished by the Aeron operator.

Can Checking and Warping be Overcome?

Basic Cause of These Troubles is Moisture—Will Elimination of All Moisture Prove Solution?—Modern Tendency to Strike at Cause, Not Counteract Effect

By R. F. Phipps

Of all the troubles encountered in producing veneered and built-up products, checking and warping or twisting are probably the most persistent. These undesirable results must be contended with and counteracted wherever plywood is used, for they are factors in the manufacture of high-grade as well as the cheapest lines of built-up wood products. Such items as loose and blistered veneers, defects and depressions in a finished surface may be termed troubles, but checking and warping are always with us.

This is an age of research in which we strive to find the cause of all our troubles and apply the remedy there, instead of merely trying to overcome the effect or result. Checking and warping are the result of some cause. If we can remove that cause, we have eliminated the result or effect. Sounds simple, doesn't it? Well, it is just about as simple as it sounds. The only trouble is that the average wood user making and using plywood will not take the lesson to heart.

Which Costs Less?

There are many, no doubt, who know the why and the wherefore of these things but who figure that they cannot afford to take the necessary precautions because it might increase the first cost of their product. Is there any difference between adding a few cents to first cost in an endeavor to remove the cause and spending good money in an endeavor to correct an effect in addition to having to throw out certain faulty material and also stand a loss through a depreciation in the value of the articles manufactured. There certainly is and it is all in favor of striking at the root of the matter and removing the cause regardless of cost. There is also the loss of prestige and reputation to consider.

Now to get down to cause. Practically all warping and checking can be traced back to moisture—moisture being eliminated or moisture being taken up. There are a few simple precautions which must be observed and which if observed and all moisture eliminated, both before and after gluing, checking and warping will not loom up to such a large extent as at present.

Dry When Laid

The time when veneers, crossbanding and corestock should be thoroughly dry, is not when such material is received, or placed in the store room or when it leaves the manufacturer's plant but when it is about to be glued. It is the moisture in the stock at the time of laying or gluing that counts and which must be eliminated. This practically means redrying. It certainly means the elimination of all guessing or supposing with regard to the moisture content of the material about to be laid. Testing must replace guessing. If the moisture content is above the permissable maximum, say, 4 per cent. on an oven-dry basis, and it likely will be, this excess moisture must be removed. There is no other solution or remedy. After conducting a series of moisture-content tests, one will probably come to the conclusion that all stock must be redried to the desired point before laying. The reason for it is this, that it will be found that the amount of moisture in nearly all material is in excess of the limits set.

Redrying may be conducted in many ways. With the aid of hot cauls, hot plate redrier or a specially constructed hot box or room in which heat, humidity and circulation are subject to control. This will insure that the material is in prime condition when laid.

Speed Prime Essential

The laying operation must be conducted as quickly as possible and the work placed under pressure immediately. This will tend to prevent any undue amount of expansion on the part of the face stock, because of moisture absorbed from glue. The sooner the pressure is applied, the less the expansion. With a limited amount of expansion, the subsequent contraction or shrinking is also less. It is this shrinking, due to the elimination of glue moisture, which is largely responsible for checks.

In view of the fact that the material absorbs a certain quantity of glue moisture, one naturally wonders if it is so essential that the stock be absolutely dry before laying. Many fall down on this point. They think that a few extra degrees of moisture content before laying does not make much difference, especially in view of the fact that the glue adds to the moisture content and that all this water must be removed after the pressure is released.

First and foremost removing all moisture from the stock before laying reduces the degree of moisture content to which the piece may attain while being glued. Suppose 12 per cent. is taken up from the glue. If stock contained 10 per cent. before laying the moisture content would reach 22 during gluing, whereas if 4 per cent. was the amount of moisture in the stock, the final degree reached will be 16 per cent. Anyone familiar with the drying and seasoning of wood knows how much checking, warping and twisting this extra six points of moisture might cause.

When Wood Shrinks Most

Again, wood shrinks most as the last of its moisture is being removed and swells most with the first moisture taken up, so that more swelling takes place while the first 10 points are being absorbed than during the time the next 12 are being taken up. That means

that stock laid with a moisture content of 10 per cent is laid in an expanded condition. By drying it and rushing the work in press, pressure may be applied before the moisture content of the face stock is anything like as high as 10 per cent. The amount of pressure applied is sufficient to check expansion even though more moisture is taken into the wood. Thus by working dry stock and working quickly, the amount of expansion and subsequent contraction, is limited.

The next operation is removing the glue moisture. This can best be accomplished in special humidity-controlled kilns or hot room. The pieces must be piled carefully so that they will lie flat, during the drying process. After being dried, they must be kept dry, otherwise the good work done is nullified to a certain extent. A dry panel will warp if exposed to moisture as well as when the moisture is being removed.

The time is not far distant when panel-making and veneering will be reduced to an exact science and conducted along predetermined lines. In that event every plant will have suitable veneer and panel-drying apparatus and rooms and the work so organized that all veneer stock and all core, and other material to be veneered, will be placed in a special drier some days before it is required and thoroughly conditioned before being sent to the veneer room for gluing and laying

Waterproof Glue in Woodworking Plants

Cold Water Glue Finding Favor—Giving Satisfaction in Door and Panel Plants—Heat Not Required in Mixing or Applying

By S. H. Johnstone

Request for Article

A subscriber has written in expressing a desire for an article dealing with the handling of waterproof adhesive in the glue room of the ordinary woodworking plant, with particular reference to sash, door and joint work. Hence the accompanying article. We are always glad to receive requests for information and articles pertaining to any phase of woodworking and stand ready to comply to the limit of our ability. What will you have?—The Editor.

During recent years waterproof, or as commonly known, casein glues, have come rapidly to the fore. This development has been due partly to their waterproof qualities, partly to the fact that they have been more or less perfected and to the fact that they can be mixed and applied cold.

Early attempts to produce casein glue on a commercial scale and for ordinary industrial purposes were not overly successful. The product, while high in adhesive and waterproof qualities, lacked uniformity, was extremely hard on knives and cutters and was inclined to jell or thicken after being mixed for an hour or two. These objectionable features have been practically overcome and to-day casein glues are giving satisfaction in a large number of plants.

Mixed and Applied Cold

Like any other material, best results can hardly be expected until a person has handled it for a short while and mastered its peculiarities. It comes in the form of a fine, light colored powder and is prepared by mixing with cold water in the proportion of about 2 to 1 of glue. The exact proportions are furnished by the glue manufacturer and his instruction should be followed rigidly. The mixture must be stirred or agitated for a brief period and then allowed to stand for fifteen minutes. During this period a chemical action takes place and the resultant glue is ready for use. The mixing is usually accomplished in hand or power mixers. When prepared it may be applied by either brush or spreader.

For joint work waterproof glue is handled the same as animal glue, except that no heat is required either to warm the adhesive or the stock, and in addition the temperature of the glue room may be maintained at a very comfortable point. Sometimes the proportion of glue to water is increased for joint work, resulting in a stronger glue, but as intimated before, the instructions issued by the manufacturer should be followed to the letter. The stock may be removed from the clamp in from three-quarters to one hour, and surfaced after three hours have elapsed. Some casein glues set in about half an hour, but it is well to allow plenty of time as a margin of safety.

In building up laminated cores and stiles, the same procedure is followed. The glue may be spread by a spreader, if such a machine is installed. In using casein glue in a spreader equipped for handling animal glue, all heat is turned off, the glue being used cold.

Thin Veneer Work

In laying veneers either in panel or door work, the glue is spread in the ordinary manner and the material placed under pressure as quickly as possible. Heated cauls are not required, although it is necessary to use a certain number of cauls to even up the pressure and in some cases to insure a smooth, even surface. When laying a thin face mahogany or oak veneer, such as 1/28 in., great care must be taken not to apply too much adhesive, as if forced through to the surface, it tends to stain the wood. This is due to the alkali or lime in the glue. The preventative is a thin spread, using smooth rollers if a spreader is used, and removing the work from the retaining clamps in about 2½ hours. When staining occurs, the application of some 10 or 15 per cent. solution of oxali acid. In joint work, to remove stains, sand the joint, apply some solution and then sand lightly again.

When using waterproof glue, one feature that requires strict attention is the life of the glue, while in its liquid state. The earlier product was usable for from one to four hours after mixing, while the present-day product has been so improved that the majority of casein glues remain liquid for from 12 to 24 hours, while some special grades are being placed on the market, that will remain liquid for 5 or 6 days. For ordinary work and with everyday grades it is advisable to mix the glue in the morning and only make sufficient to take care of the day's work. During the very hot weather some woodworkers mix two small batches, one in the morning and one at noon. Glue that has been carried over from the preceding day may

be thinned and mixed with some fresh material and thus used up.

Owing to the fact that many casein glues thicken and deteriorate after they have been mixed from 10 to 24 hours, trouble is sometimes experienced when an attempt is made to work waterproof glue in the machines found in the ordinary door-making plant. This refers particularly to the machines which squirt glue into the dowel holes and those which apply the glue by means of spiral fingers. This may be overcome by careful manipulation or by the use of special glues, but must be handled with care.

When used according to directions, these glues make a strong joint; one that is impervious to heat, moisture, oils, etc. Figures recently issued by the Forests Products Laboratory, Madison, Wis., give a spread of from 35 to 55 square feet per pound, so that it has a good covering capacity. At the present time it has a wide application, being used in a number of different fields for a wide variety of purposes.

Should Five Plys Be Glued at One Time?

Success Depends Upon Methods Followed—Plenty of Heat Required for Animal Glue—Core and Cauls Must be Well Warmed

By John Welmers

Every glue has its advantages, also its disadvantages. They differ not only in strength and water resistant qualities but also in price and methods of use. When we look at the methods used in laying veneer with animal glue we are apt to think they are slow, but every manufacturer has his own opinions about speed and if he were not convinced that his is the best method, he would change. Sometimes prejudice keeps a man from changing over. He just will not listen to argument against his pet hobby, consequently he rides his hobby until he falls off, or until his hobby breaks down. Then he sees things as they are and is willing to listen to the other salesman.

In the matter of glues, though it does not pay to keep a deaf ear to all arguments, in fact that is the way we learn, by getting the other man's viewpoint, some methods appear slow to one man while to another, the opposite, would be true for he sees a little deeper than the surface. He weighs results and after all they are what count. Take for instance the matter of laying 5 ply. The difference in the methods used is great, but either method may pay. The usual custom is to lay 5 ply in two operations when using animal glues, however, there is hardly an excuse for doing the job in two operations.

Comparing Two Methods

For the sake of comparison we might consider the various steps necessary to make a 5 ply panel in two operations with animal glue. In the first place the cauls must be warmed, which is in itself a task, for each caul must be handled twice, first in the heater and next out, saying nothing of the space taken up by the water and the steam required to heat it. Then with the cauls warmed the method of laying the 3 ply is familiar with all veneer men.

After the panels are taken from the retainers, the job of preparing them for the next ply presents itself and is no small job, for the paper which is generally used to keep the panel from adhering to the caul is stuck to the panel and must be removed. A considerable amount of this can be pulled off, but what remains has to be taken off either by scraping, sanding, or sponging. Not only this paper has to be taken off but also the veneer tape. Right here is a point that is often used in defense of animal glue. It is contended by some that to glue up a 5 ply panel in one operation and leaving the veneer tape on the crossbanding, is bad practice, and there are few who do not admit this. Everybody has seen trouble due to the fact that the crossbanding blistered just at the point because the veneer tape let go or else separated in the middle. This is a bad feature and is the reason why some people do not make 5 ply in one operation. There are others again who think the trouble of this nature is so small as to be negligible.

Removing Paper and Tape

Going back to removing the paper again, we might discuss the various methods. A man that can get good results with scraping this paper off by machine, is a good one if he can do it without ripping up a little veneer once in a while. Sanding is also good but the sandpaper fills up with the paper so quickly that it hardly pays. Both scraping and sanding have the advantage of doing the job in one lick. With sponging, however, this is not true for the time alone required for the water to soften up the paper and glue is much greater than the time required for the same panel to go through the sander or the scraper twice. Then the paper must be scraped off by hand, after which the panel is piled along with the rest of them on stickers and allowed to dry.

Another point that is brought up frequently is that when the 3 ply panel is cleaned up by scraping or sanding, any little irregularities or high spots that may occur are levelled off and are not transmitted to the last ply only to be sanded through then. On the other hand if the cauls are not too soft and have a nice level surface, there is not much danger of high spots. They will not always remedy the little warps or turned-up corners, however, and it is these that are levelled off by the sander or scraper.

After the panels are all cleared up, things are gotten ready again and the last two plys are laid identically the same way as the first three sheets so is of no use to repeat the process. The drawback in laying 5 ply in one operation with animal glue, however, lies in the fact that the glue chills rapidly and this is practically the only thing we have to combat.

Trouble From Cold Cores

A manufacturer recently called my attention to a problem in his glue room. He was having trouble with the veneers coming loose and blistering. He had started laying 5 ply in one operation with animal glue some time ago, and experienced no trouble and was up a tree to know where the fault lay. Everything was done the same as previously, same glue, same equipment and everything. Upon investigation, I found that he commenced this little stunt early in the summer when things were naturally warm, but as soon as cold weather set in, his troubles commenced.

His glue room was nice and warm so he didn't believe the trouble was there. His glue room was warm,

it is true, but it wasn't warm 24 hours a day and 7 days a week, and that was the cause of his trouble. The fact that the stock to be veneered was close-piled accounted for cold cores. A truck load of close-piled cores does not warm up clear through, if left in a warm room for some hours, at least nothing like they would in the summer time when the temperature is up all the time.

Best Method of Heating

The problem then resolved itself into the fact that the stock must be heated, for there is not enough heat in a caul to warm up the glue next to the core sufficiently to make it soften or to keep it soft until the batch is pressed and finally held firmly in retainers. The methods for accomplishing this end may vary according to conditions in the factory. The glue room may have sufficient heater space to heat cores and cauls, but I do not believe I would advise putting the cores into a dry heater for fear they might be damaged.

A better plan would be to build a small kiln capable of holding a sufficient number of trucks to handle the business. Such a kiln should have provisions for circulation and also for controlling the humidity so as to keep the cores from drying out too much. Then the cores could be piled on stickers on trucks and the entire load pushed in the kiln. Conditions in the kiln should be such that the cores would reach the temperature of about 90° F., which is sufficiently warm to keep the glue from chilling and until pressure is applied. Then when ready for use, the only thing necessary would be to push the truck alongside the glue spreader and get busy, thus saving at least one handling. So, when looking at the proposition from both sides, we can see that each has its advantages and where speed might be attained one way it might be lost by defective workmanship.

Sanding Practice and Quality Veneer Work

Value of Fine Sanding More Widely Recognized—Cutting Down Face Veneers Not Way to Correct Faults in Cores—Better Sanding Demand of Future

By A. Monmouth

With the present disposition to apply engineering ideas and practices and scientific analysis to the woodworking industry, the question of sanding machines and sanding practices should logically come in for a big share of attention. Moreover, this will have a distinct hook-up with the veneer-using industry because of two things. One is that it is this industry that has led to the biggest development in sanding machines and the practice of sanding by machinery. On the other hand, sanding is something we are realizing as a very important factor, both in the quantity and quality of veneer work done. In a word, the veneer industry has brought much more sander work into wood using, while on the other hand, proper sanding is helping to refine the work of veneering and reduce it to an art.

The present purpose is not so much to discuss sanding machines in detail as to give consideration to the matter of when and where sanding should be done and how it should be done. In other words, the matter of service the machine should perform, and why.

More Sanding than Formerly

We are realizing, for one thing, that it is advisable to do two or three times as much sanding as was formerly considered necessary in the course of making and finishing woodwork. In the old days of solid wood the only sanding done was that on the outside of the finished surface, and then only the exposed surface that was to be stained and varnished. The first machines to enter this work were disc sanders, drum sanders—that is, the round, stationary drums over which shaped pieces like chair rockers were held by hand to polish off saw marks and smooth the surface. Small, flat surfaces were sanded on disc sanders in similar manner, while for the larger surfaces disc sanders were mounted on jointed arms so that they could be moved about over the surface of the work.

Then came the drum sanders, put up somewhat in the form of planers with power-feed rolls, and out of these were developed the modern drum sander with a series of drums, sometimes fed with rolls and sometimes with endless beds, with flexible rubber mats to take care of some variation and unevenness in thickness. Meantime, until veneering came along to multiply the quantity of production and of surfacing needing sanding, quite a lot of the finer sand work was done at the cabinet benches by hand. Along about the time veneering was being developed there was also brought out the idea of belt sanding, as applied to cabinet work, which has done much to replace a lot of the old hand sanding. The belt idea in sanding had long been used for polishing turned articles, the belt running over fixed pulleys and the work being held against the belt by hand or with some special device. The later development, however, was out of the conception of applying a combination of the belt and table idea, to finishing off cabinet work.

More Sanding Necessary

Out of all this we have developed today an interesting line of power-driven sanding machines, and among them any man can find mechanical equipment to do effectively almost any kind of sanding desired. The main questions here are those of getting quantity and production sufficient for given kinds of machines to justify several, or getting a machine that is adaptable to a wide range of uses, so as to get effective service in the matter of time and labor-saving in sanding. This part of the work has made splendid progress. The point meriting special attention now is that of the extent to which sanding may be profitably employed and the manner in which it should be done to produce satisfactory results.

The broadest field of possibilities is that of the increased quantity of sanding which may be profitably done. When the industry first started using veneer it was inclined to follow the sanding practices of solid-wood working—that is, just to finish off the outer surface. In the course of time and in the process of refining it was learned that to get a good finish with fine face veneer, especially when cut thin, the cross-banding or corebody underneath the face veneer should first be scraped or sanded and reduced to a smooth, even surface. Following this matter further, we find in many cases that it may be advisable to do

VERSATILITY

—*The Keynote to Operating Efficiency*

Versatility of manufacturing requires a complete assortment of manufacturing facilities and a supply of varied raw materials, all of high character. Our long successful record has been developed on a plan which aimed at an organization which could fill any and all requirements for high grade hardwood materials. That versatile organization maintains contact with a tremendous supply of splendid timber and incorporates four band mills and three veneer mills, each designed for the manufacture of a specific product. The result is the best obtainable in quartered and plain white oak lumber, sawed quartered oak veneers, walnut lumber and sliced and rotary cut walnut veneers, rotary cut yellow poplar crossbanding and a general line of high-grade hardwoods—an offering and a service that warrants your inquiries.

ALGOMA *the Better* Plywood

You be the Judge—Put Algoma Plywood on trial. Test its right to the title, "the better Plywood." You can sit in judgment on its performance by using an order in your own plant. See if it has a better surface —measure the accuracy of every dimension—examine the matching of the grain—watch how the panels you use stand up under use. Then you can decide for yourself whether Algoma Plywood deserves to be used for every job you turn out.

We do not urge you to make this test for the sake of selling one order. Our business has grown for 35 years by winning steady customers. We frankly ask you to try Algoma, the Better Plywood, because we are convinced it can win you as a regular customer.

You can get an Algoma Plywood made to fit your special requirements in either curved or flat panels. Our stock size panels bring you economy through standardized production. Let us send you estimates.

ALGOMA PANEL COMPANY, *Algoma, Wis.*

at least two sandings previous to and aside from the finishing off of the face veneer before varnishing. Suppose, for example, one is making a heavy table or dresser top and the body is built up in the form of what we know as solid corebody. This means that there is a series of strips of solid lumber, matched and glued together edgewise to make up the desired width. This should be crossbanded, after which the thin, fine face veneer is applied.

If the crossbanding is thin, too, the logical place to start smoothing up is with the solid corebody. Maybe you feel that running it through the planer is enough, but for fine work, where both the crossbanding and the face veneer are thin, say from 1/20 to 1/30-in., it is obvious that any wrinkle or unevenness in the corebody will show through and mar the beauty of the finished work. Therefore, for a fine job the logical starting place is the solid corebody. This should be scraped or sanded, or both, to get it even and true as to surface and to get it smooth and in good condition to take the glue. Then on top of this should go the crossbanding as one operation. It should be allowed to dry, then the surface sanded off again as a preparatory step to applying face veneer. Thus we have multiplied the quantity of sanding three times.

When we come to apply scientific analysis and engineering ideas to this matter of sanding in connection with the veneer industry, we will find a number of interesting things. One of them is that by increasing the number of times we do sanding in the process of making up a piece of flat cabinet work, we lighten the work or lessen the burden for each sanding and make the final sanding much lighter and more delicate than if we had no previous sanding. That, in turn, brings out the question of refinement in sanding operations, which is the real meat we are after in the present discourse.

The makers of sandpaper have performed a good service for the industry by awakening a keener interest in the subject of sanding, through analyzing in detail the process of making sandpaper. We have come to realize through the enlightenment resulting from the awakened interest that there is an element of quality and refinement involved, and this is the element which really merits the earnest attention of the industry both in the matter of sanding machines and sanding practices.

The big thing the industry should get out of an applied study of sanding machines and practices is a higher quality of work, which will mean a finer quality in the finished product. We are realizing, for example, that sandpaper must be very carefully made and overhauled so that it will cut smoothly and not scratch. We should seek for this same uniformity and delicacy in the adjustment and operation of machines, and to seek to get smooth, free cutting without scratches and scorching and other things to mar the quality of the work, and to have efficiency of the machines and sandpaper. In a word, we must seek for more accuracy in machine adjustment and operation, as well as for more refinement in the sand and sandpaper used. Those who use belt sanders and apply the sand themselves, must learn to do this properly, otherwise it would be better to have it done by others specializing in this work. There is an interesting question here whether it will not profit the industry to submit its preparation of sand belts to people specializing in this work, who can equip themselves to do it much better than it can be done in the average woodworking plant. If the makers of sand belts, for example, take anything like the pains in making them up and sanding them that the sandpaper people take in putting up high-grade sandpaper, they probably make a much better job of it than the average users of sand belts can do themselves. In that case it will probably pay to stock up with sand belts and return the used ones for recoating, where they are equipped to do this scientifically so as to insure evenness and quality.

The industry, in the course of applying scientific analysis for future progress, will find it necessary to do more sanding and better sanding. This, while it will call for some ingenuity to devise machines and methods which will reduce the cost of handing and sanding to a minimum, will also call for a closer study of the results obtained in sanding and for more exactness in both machines and practices. When we get this, when we get the habit of applying science and more exactness in everyday practice, we will not only find more interest in the work, but we will find developing out of it a greater care of efficiency in the working of sanding."—"Veneers," Indianapolis.

Plywood Reinforced with Wire Stitching

In England a type of plywood known as "consuta plywood" has been developed for use in the manufacture of automobile tops and bodies, motor launches and boats of all kinds and in the construction of air and seaplanes. This plywood, which has been developed from the copper-sewn methods of boat construction, consists of a number of piles of wood glued together, using waterproof glue or cement with the grains turning in different directions and then lock-stitched with fine copper wire. The stitches run lengthways in rows of 1¼-inch pitch and may be countersunk so that a smooth surface is secured. It is manufactured in sheets up to 8 feet wide and as long as 60 feet, and usually runs from ⅛ to ⅝ inches in thickness. For boats and aircraft, mahogany and cedar are generally used, but any suitable wood may be employed. In the construction of tops for car bodies, such as coupe and sedan bodies, it has been found that the consuta plywood is lighter than steel and there is an absence of drumming and creeking. Such material has a very wide application as it can be used to advantage for a large number of purposes.

Information and Inquiries

You are cordially invited to make use of this department

Upholstering Supplies

Montreal, April 4th, 1921.

Editor, Canadian Woodworker:—

Will you kindly tell us where we can secure the following material: moss, wood for bowling alleys, linings for chesterfield suites, coverings and general upholstering supplies?

Yours truly,
Montreal Store Fixture Co.

The Griffin Curled Hair Co., Toronto, and Bauers, Limited, Waterloo, Ont., should be able to supply you with moss and filling. Wood for bowling alleys could be secured from the Brunswick, Balke, Collender Co., Hanna Ave., Toronto. This firm specializes in bowling alley equipment and could furnish you with the stock for a bowling alley manufactured and cut to size ready for assembling.

The A. F. Burch Co., of Grand Rapids, Mich., manufacture a line of upholstering covers and would, no doubt, be glad to furnish you with full particulars of their line. Linings may be secured from Landers Bros. & Co., Limited, Toledo, Ohio.

Fasteners for Attaching Mirror Standards

Toronto, March 31st, 1921.

Editor, Canadian Woodworker:—

Will you kindly tell me where I can get screws for fastening mirror arms or posts to the case top. This screw is threaded on both ends and one end is fitted with a thin washer nut suitably notched for tightening.

Sincerely yours,
C. N. Glover.

This fastener is known as the "Tillotson Fastener" and can be secured from almost any manufacturer or jobber of furniture hardware. Any one of the following firms can take care of your requirements: Weber-Knapp Co., Jamestown, N.Y.; Keeler Bros. Co., Grand Rapids, Mich.; National Brass Co., Grand Rapids, Mich.; Hammacher, Schlemmer Co., 4th Ave. and 13th St., New York.

Canadian Hardwoods Wanted

An importer in Paris desires to get into communication with Canadian exporters of hardwoods, Douglas fir and cedar. Is prepared to order a sample shipment of different Canadian woods as an experiment with a view to specializing in lines which are most suitable. Quotations should be made in both Canadian and metric measurements. In this connection the Canadian Government Trade Commissioner in Paris reports that he has recently received several inquiries in regard to Canadian woods, especially hardwoods, which are practically the only ones known in the French market. There appears to be a scarcity in France of woods suitable for the manufacture of furniture, doors, etc., and this fact indicates that there should be an excellent opportunity for Canadian manufacturers to open trade connections. Quotations should be in the metric system, or a comparison made between metric and Canadian dimensions.

Braces for Card Tables

Editor, Canadian Woodworker:—

Could you advise me as to where I could obtain braces for card tables?

Sincerely yours,
J. H. Atherton.

We believe that the Weber-Knapp Co., Limited, Jamestown, N.Y., could take care of your requirements in this line. If they do not handle a suitable brace, we would suggest that you get in touch with the National Brass Co. or the Keeler Brass Co., both of Grand Rapids, Mich., or Hammacher & Schlemmer Co., 4th Ave. and 13th St., New York.

Wood Mantels Wanted

New Glasgow, N.S., March 30th, 1921.

Editor, Canadian Woodworker:—

Will you kindly tell me where I can secure some wood mantels finished in the different shades which are in demand?

Thanking you for your kindness, I am,
Yours truly,
G. H. Grant.

Almost any operator of a woodworking plant would be glad to accept your order for a number of mantels made as required and to your own design. The W. A. Moore & Co., 11 St. Albans St., Toronto, specialize in this line. No doubt they would be glad to furnish you with their catalogue on request.

Early English Finish

One large woodworker writes in asking how he can finish oak in what is known as the Early English Finish. The lines manufactured include extension tables and articles of a like nature. We furnished the following suggestion, but would appreciate it if some of our readers would supplement this information by outlining their methods:

Stain

Ground walnut crystals	2 oz.
Black, P. B.	1 oz.
Water	1 gal.

In applying this stain the work should first be sponged with a solution made by dissolving ½ oz. lye in a gallon of water. After this application has dried the surfaces should be sanded lightly and the stain applied. The wood is next filled, using a very dark filler. Sand thoroughly with fine sand paper and finish with one coat white shellac and two or more coats of clear varnish.

Special Equipment Required

Montreal, March 24th, 1921.

Editor, Canadian Woodworker:—

Can you tell me where I can secure a tapering machine such as is used in the manufacture of fishing rods?

Yours truly,
W. Finkletin.

We do not know of any machine made for this special purpose. If you are making fishing rods on a scale to warrant the expenditure, no doubt you could have one constructed to your order. Where fishing rods are made in small quantities, the usual method is to work them out by hand.

VENEER OF QUALITY

We carry in stock, for immediate shipment, 3 and 5 ply Panels in Birch, Oak, and Mahogany — sizes 24" and 30" wide, 48", 60" and 72" long.

A complete range of American Walnut, Mahogany, Quartered Oak (in all thicknesses) Figured Gum Veneers and Rotary Cut Veneers is stocked at our plant awaiting your selections.

Our best advertisement is a **trial order**—because more orders come pouring in with requests to "repeat the same quality."

This is not a difficult request for us to fill because we handle nothing else but **quality veneers.** Let us convince **you.**

Toronto Veneer Co., Ltd.

1100-1104 Queen St. West, TORONTO, ONT.

Prompt Delivery

LONG-KNIGHT LUMBER COMPANY

INDIANAPOLIS, IND.

Requirements of the British Market

The following information regarding the market, in Great Britain, for closet seats was gathered by Trade Commissioner, Norman D. Johnston of Bristol, England. The illustrations and descriptions indicate the kind of closet seats which find the greatest sale in the Bristol district:

Ring Seat

The closet seats without covers seem to be preferred in this country. The ring seat has a very extensive sale, in fact I think it might be said to have a larger sale than any of the other seats. It is most popular in hardwood, which is sold unpolished by the manufacturer at 5s. 5d. each at the present time. It is also sold in polished imitation mahogany at 7s 3d. each. Galvanized hinges are used, but brass hinges are preferred.

The ring seat is also made with a cover, but this style is not nearly as good a seller as that without a cover. If persons desire a seat with a cover they generally buy one of the more expensive kinds. The ring seat with cover is now bought from the manufacturer in imitation mahogany, polished, at 12s. each, and in solid mahogany, polished, at 19s. each.

Extension Seat

Probably the seat which finds the best sale next to the ring seat without a cover is the extension seat illustrated above. The manufacturers' price for this seat in hardwood unpolished, is 7s. 3d. each, in imitation mahogany, polished, 9s 6d. each, and in solid mahogany, polished, 17s. 3d. each. The one in imitation mahogany is perhaps in greatest demand.

One of the best, if not the best, seats with a cover as far as sales are concerned is the extension seat with cover. This seat is bought from the manufaceurer in polished imitation mahogany at 15s. 9d. each and in polished solid mahogany at 24s. 9d. each. In this case, as in most of the others, brass hinges are preferred.

What would likely be ranked third in order of popularity as a selling proposition is the standard seat without a cover. The manufacturers' prices are 9s. 6d. each in unpolished hardwood, 11s. 9s. each in polished imitation mahogany, and 21s. 3d. each in polished solid mahogany. Side hinges are used. This seat in solid mahogany is a good seller.

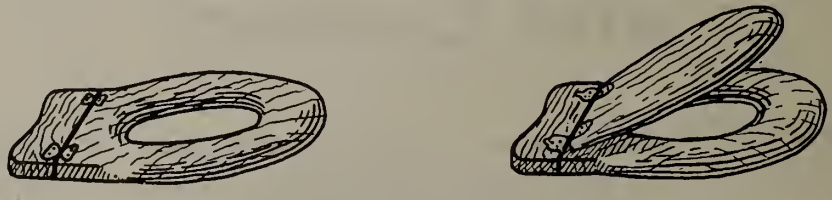
The standard seat with side hinges is also made with a cover. It sells in imitation mahogany polished, for 21s. 3d. and in solid mahogany, polished, for 31s. 6d. each.

There are other styles in demand but it is hoped that the above information will indicate some of the closet seats which find favor in this district.

Ten Commandments for Foremen

1. Be an optimist. Confidence is infectious.
2. Make few promises. Keep every promise made.
3. Every question has two sides. Always hear both.
4. Study your men. Put each where he can do his best work.
5. Never show discouragement. A stout heart will never say die.
6. Don't hold spite. Correct when necessary, but forgive afterward.
7. Notice good work as well as bad. Give credit and blame justly.
8. Be fair. A foreman often has to act as judge, and therefore must be just.
9. Control yourself. Anger is too valuable to use except on special occasions.
10. Take your full share of the blame. Sharing both blame and praise with workers is a big part of the secret of managing men.

Ring seat with and without cover.



Extension seat with and without cover.

Standard seat with and without cover.

The Lumber Market

Domestic Woods

Predictions are of little avail in attempting to outline the situation with regard to domestic woods. Business should be better than it is, but that does not make it so. The demand for all kinds and grades of stock is very low and does not apparently show any signs of improving. In the softwood market hemlock prices are away down, yet this decrease in hemlock values has not resulted in stimulating sales. Competition from B. C. woods and southern pines is very keen; in fact there is considerable comment because these woods can be brought in and sold at a price below that being asked for white pine. It is anticipated that there will be a drop in the price of B. C. products of from $2.00 to $2.25 per M during the next few weeks. This is due entirely to the drop in freight rates which went into effect on April 21st when the rate on lumber from British Columbia was cut to 90c a hundred instead of $1.03½ as at present. The new rate to Montreal will be 95c per hundred. The effect of this will be a reduction in the delivered price of about $2.00 per M. This will have some effect on building costs and should result in stimulating the construction of homes. There is an undoubted shortage of residential buildings and there should be a building boom during the coming season. Whether this will materialize or not it is difficult to say. There is every reason to suppose that a greater amount of building will be undertaken, yet building activities may not live up to expectations. Should there be a fair amount of construction work undertaken, it will, certainly, result in an increased demand for lumber of all kinds and should have the effect of stiffening values.

Stocks of all kinds are not any too plentiful and production is at a very low ebb. In the hardwood field the upper grades are very scarce, particularly in dry stock, but there is a considerable quantity of lower grades available. The price of these latter items has dropped while the upper grades are being maintained at a fairly high level.

The attitude of the lumber user and lumber consumer seems to be to put off purchasing as long as possible, and when forced to buy, to order in small quantities and look for quick delivery. This is evidenced by the fact that numerous orders are being placed for mixed cars in which there is a wide range of stock such as birch, maple, walnut, mahogany and oak, all in one car. Putting off buying is frought with danger for should the demand increase, prices are bound to stiffen and those wood users who have permitted their stocks to dwindle, may find that they will have to pay a price considerably in advance of that for which they could secure their requirements at the present time.

Imported Woods

The feeling of the hardwood lumber operators in the various American centres is that we are on the eve of new developments. Inquiries are coming in, in an ever-increasing number and more orders are being booked. This must not be taken to mean that the demand is anything like normal, but it does indicate that there is a slight increase in the amount of lumber being purchased.

In many of the hardwood sections there is an overproduction of low-grade stock and a scarcity, which almost amounts to a shortage, of the better grades. Shipments of lumber from the Memphis territory during March were larger than for any month since the depression in the hardwood industry made itself felt last fall. This is taken as an indication that business is on the increase and that the situation is gradually showing signs of becoming better. Production has been kept down to a very low point so that it is not improbable that available stocks have been cut down. Manufacturers of interior trim, flooring and finish and of waggons and implements are among the largest buyers. There is also a slight demand from the furniture industry.

In considering lumber values one must not overlook the fact that the heavy increase in freight rates, which took place last fall, has a very marked influence on present lumber prices. The lumber manufacturer is accepting a loss on nearly all stock sold. B. F. Masters, in an address before the National Association of Box Manufacturers, gave a concrete example of the effect of high freight rates on lumber prices at the present time. No. 2 gum is selling in Chicago at about $22.00 a M delivered. Under present freight rates, the freight on the stock is $14.00 a M, which leaves $8.00 for the millman. It does not seem possible that a lumber manufacturer can cut the stock and sell it for $8.00 and even receive his money back, let alone make any turn on the transaction.

It would appear to be the part of wisdom for all wood users to keep a fair stock on hand, for it will not take very much to stiffen values and shove the prices up. Each month means that we are that much nearer the time when things will commence to move. Whether the demand for lumber comes back with a rush or whether there is a gradual improvement it would seem as if values are bound to improve. It is not likely that the next few months or the next year will see lumber prices any lower than they are today. It would be little short of a national calamity were they to do so. Present values cannot last indefinitely, so that putting off the time when needed purchases are to be made is gambling against time. If the market revives, ever so little, in the meantime the person who has put off has lost. Help stabilize conditions by buying what you need and buying now. It would be good business.

Selling Flooring by Foot Measure

Several American manufacturers of hardwood flooring have suggested that in future hardwood flooring be retailed at the actual square foot or face measure, that is, the quantity required to cover one square foot, instead of flooring feet which are from 20 to 33 per cent. short of the amount necessary to cover a given space. To aid the dealer in quoting on this basis the following table has been compiled. This gives the price per square foot, square measure, covering the actual quantity required to cover one square foot, based on the regular quotations per thousand flooring feet. The figures in the first column are the retail price per thousand feet. The other prices are figured to include manufacturer's waste and are the selling price of flooring sufficient to cover one square foot. Allowances should be made for irregularities in shape of rooms and for floorlayer's cutting waste:

News of the Trade

S. J. Cann, Exeter, Ont., has purchased a factory and intends installing some woodturning equipment.

The Gove Motor Car Co., of Detroit, Mich., contemplate erecting a Canadian branch at St. Catharines, Ont.

The Reynolds Motor Truck Co., London, Ont., contemplate adding a new unit to their woodworking plant.

J. A. S. Vincent, 307 Papineau Ave., Montreal, has commenced work on a one-storey carriage factory, 73 x 40 feet.

The J. T. Gilchrist Lumber Co., Limited, 496 Gladstone Ave., Toronto, are erecting a one-storey brick office at a cost of $3,500.

The Gove Motor Car Co., Tilbury, Ont., is being organized to erect and equip a plant to manufacture motor cars and trucks.

L. Turneau, 2 Concord St., Montreal, is fitting up a small workshop and is in the market for a circular saw, jig saw, shaper and lathe.

The Newport Carriage & Wagon Works, Whitby, Ont., has been sold to James F. Pirie. This is one of the oldest industries in Whitby.

A small fire occurred in the plant of the Hayes Wheel Co., Chatham, Ont. The blaze was extinguished before much damage had been done.

Montreal Paint & Varnish Company, Limited, Montreal, were recently incorporated to manufacture and deal in polishes, stains, varnishes and paints.

The National Steel Car Co., Limited, of Hamilton, has, according to a recent announcement, changed its name to The Hamilton Car Co., Limited.

J. Wills, 414 Arlington Ave., Ottawa, has commenced work on a small woodworking and carpenter shop. This building will be one-storey, 32 x 24 feet.

The Art Furniture Co., Limited, Kitchener, Ont., has been awarded a contract by the Dominion Government for the fittings for the post office at Yarmouth, N.S.

The offices of C. G. Anderson Lumber Co., Excelsior Life Bldg., Toronto, were recently remodelled and enlarged and the firm now has a fine suite of private offices.

La Fonderie de Ste-Croix Limitee, Ste-Croix, P.Q., have been incorporated to manufacture and deal in machinery for planing mills and woodworking plants. Capital, $20,000.

The Canadian Pulp Machine & Engineering Company, Quebec, Limited, Montreal, have been incorporated to manufacture and deal in all kinds of woodworking machinery.

Haley & Lincoln, 821 Azilda St., Tetraultville, Montreal, are in the market for the following woodworking equipment: Single spindle reversible shaper, swing cut-off saw and one sander.

The Southern Furniture Exhibition which is to be held at High Point, N.C., June 20th to July 2nd, will be staged in the new million dollar Southern Furniture Exposition Building.

C. Guiot, 1230 Christophe Colomb St., Montreal, recently commenced work on a small carriage factory to cost $12,000. The new building is to be two storeys, 64 x 38, of brick construction.

The Board of Education, Hamilton, Ont., are having plans drawn for a new four-storey building to be used as a technical school. This will be equipped with the usual departments.

The workshop and boathouse of L. St. Pierre & Sons, boat builders, P.Q., was recently destroyed by fire. About 200 rowboats went up in flames. The loss is estimated at $12,000 with $2,000 insurance.

The plant and equipment of McIntosh Bros., Bathurst, N.B., was recently offered for sale. The planing mill was acquired by John McIntosh for $15,700, while the sawmill and logs went to E. J. Palmer.

The plant of the Standard Automobile Painting Co., Windsor, Ont., was damaged by fire recently to the extent of $9,000. Several cars which were in the shop at the time, were more or less disfigured.

Hercules Truck Company, Limited, Hamilton, Ont., were recently granted a federal charter to acquire the business known as Hercules Truck Company, and to manufacture and deal in carriages, trucks, aeroplanes and other vehicles. Capital, $100,000. William Kerr and E. S. Kerr, manufacturers, both of Hamilton, Ont., are two of the incorporators.

The Thornton Smith Co., Toronto, dealers and makers of period furniture, are building a handsome store at 342-46 Yonge St. This building is an imposing structure, with a distinctive front in white stone.

Walter Thomas of Eureka, Cal., is considering equipping a plant at New Westminster, B.C., to make fuel from wood waste. At the present time he is manufacturing this fuel in California on a commercial scale.

It may be of interest to note that the first auto to be built in Canada was made by A. J. Frost of Owen Sound. This was of his own design and travelled 18 miles an hour, giving 35 miles to the gallon of gasoline.

Electric Refrigerators, Limited, Toronto, were recently incorporated to manufacture and deal in refrigerators. Capital, $40,000. F. C. Carter and R. L. Kellock, solicitors, both of Toronto, are two of the incorporators.

Another Government steamer, the "Canadian Coaster," was recently launched from the Kingston yard of the Collingwood Shipbuilding Co., Ltd. This vessel will be added to the Canadian Government merchant marine.

M. A. Bradshaw, Limited, Montreal, have been incorporated to manufacture and deal in boxes and other wooden containers. Capital, $49,000. F. B. Common and F. G. Bush, both of Montreal, are two of the incorporators.

National Handles, Limited, Toronto, Ont., were recently incorporated to manufacture and deal in handles and wood turnings. Capital, $40,000. E. E. Williams and D. E. Rogerson, both of Toronto, are two of the incorporators.

G. O. Calvert of Twickenham, England, claims to have evolved a process for the manufacture of synthetic alcohol on a commercial scale. It is claimed that under this method the alcohol can be produced and sold at about $100 a ton.

R. G. Dryden, who operates a planing mill at Toronto, Ont., has purchased a site for a lumber yard at Mount Denis, Ont. The new operation will be in charge of James Nash. The business in Toronto will be carried on as heretofore.

The Chesley Furniture Co., Limited, Chesley, Ont., manufacturers of twin pedestal tables, are putting a new extension table on the market in the shape of a four-post table. This is being manufactured in the different period designs.

International Toy Company, Limited, Montreal, was recently incorporated to manufacture and deal in toys and other wood products. Capital, $50,000. Two of the incorporators are A. A. Magee and T. B. Heney, both of Montreal.

A. Amiot, Limited, Montreal, were recently incorporated to manufacture and deal in pianos, phonographs and other musical instruments. Capital, $200,000. Two of the incorporators are Aime Amiot and Armand Amiot, both of Montreal.

R. H. Hamlin, general manager of the Empire Sash & Door Co., Winnipeg, Man., has been elected director of the Western Life Assurance Co. Mr. Hamlin has been very active in the civic and business life of Winnipeg for a number of years.

Read Motors, Limited, Three Rivers, P.Q., have been incorporated to manufacture and deal in automobiles, boats, aeroplanes and vehicles of all kinds. Capital, $199,000. Two of the incorporators are F. B. Common and F. G. Bush, both of Montreal.

George H. Savage and Alex. King of Duncan, B.C., are opening a modern sash and door factory under the title of "The Cowichan Joinery Works." Millwork of all kinds will be undertaken and special attention given to stair work and interior finish.

Robinson Motor Car Company, Limited, Montreal, have been incorporated to manufacture and deal in carriages, car bodies and other wood products. Capital, $50,000. W. K. McKeown and L. C. Herdman, both of Montreal, are two of the incorporators.

The Department of Soldiers' Civil Re-establishment at St. John, N.B., are equipping a workshop. Present plans call for the installation of equipment to manufacture berry boxes, crates and other wood products in addition to tools and several lines in metal.

The Gulf Transportation Company, Limited, Quebec, P.Q., has been incorporated to manufacture and deal in steamboats, tugs and other craft. Capital, $50,000. Among the incorporators are C. E. Taschereau and J. P. Cantin, both of Quebec, P.Q.

The Anglo-American Auto Co., Room 1504, Royal Bank Bldg., Toronto, have purchased a site at Mimico, Ont., on

Also manufacturers of International Dayton Scales and International Electric Tabulators

which they propose to erect a $500,000 automobile factory. The owners have not decided on the date when construction work will be commenced.

The staff of the R. A. Laidlaw Lumber Co., lumber dealers and woodworkers, Toronto, held a very enjoyable at home for their present and former employees. This was the first re-union which has been held in a number of years. A most enjoyable time was had by all.

The Lucknow Table Company, (Private) Limited, Lucknow, Ont., was recently granted incorporation to conduct a general furniture manufacturing business. Capital, $125,000. J. Button and G. T. Aitchison, manufacturers, both of Lucknow, Ont., are two of the incorporators.

La Compagnie Bernier & Dufour, Limitee, St. Benoit, P. Q., have been incorporated to manufacture furniture, musical instruments and other articles of wood. Capital, $49,000. J. Dufour, St. Moise, P.Q., and J. A. Dufour, Mont Jo'i, P.Q., are two of the incorporators.

The match splint factory at Pembroke, Ont., which is part of the $5,000,000 match factory to be erected by the firm of McGuire, Patterson & Palmer, was recently put in operation. In the meantime plans for the construction of the main plant are being held in abeyance.

The Canada Machinery Corporation of Galt, Ont., have closed out their Brock Ave. showrooms and warehouse and have moved their Toronto sales office to Rooms 721-22 Bank of Hamilton Building. W. J. Irving will continue in charge of the Toronto sales force, as heretofore.

A slight blaze occurred in the boiler room of the furniture plant of Malcolm & Hill, Kitchener, Ont., but was extinguished before much damage was done. The fire was caused by the explosion of gas in the furnace, which blew open the doors and set fire to the boiler and engine room.

The fruit growers of the Niagara Peninsula have decided to go ahead with the basket factory which they propose erecting at Niagara-on-the-Lake. Certain concessions have been granted the company by the town and it is anticipated that the work will be undertaken in the near future.

The Coffield Washer Company of Canada, Limited, Hamilton, Ont., were recently incorporated to manufacture and deal in washing machines, wringers and other household appliances. Capital, $50,000. Two of the incorporators are H. Bloom and W. C. Brittain, engineers, both of Hamilton, Ont.

An organization was recently formed by the employees of the North American Furniture Co. Limited, Owen Sound, Ont., along co-operative lines, for the purpose of securing lower prices on foods, clothing, etc., by buying as an Association from the local stores which will give them the lowest prices.

The Dominion Forest Products Laboratory, Vancouver, B.C., is adding a 300,000 lb. testing machine to its equipment. This will make the third lumber testing machine to be installed in this laboratory. The other two machines comprise an Olson 30,000 lb. testing machine and a Hart-Turner impact machine.

The Technical School Commission of St. Hyacinthe, P.Q., have had plans drawn for a technical school to cost $100,000. Tenders will be called for the erection of this building in the near future. A quantity of special furniture will be required for this school and separate tenders are to be called for this work.

The ratepayers of Southampton, Ont., recently passed a by-law guaranteeing the bonds of Panels Limited to the extent of $20,000. This money is to be used by the company in enlarging their factory and installing equipment for the manufacture of patent veneer rim-bound table tops and other built-up products.

Everett & Son of Waukegan, Ill., are moving their plant to Sault Ste. Marie, Ont. They manufacture a line of woodenware of different kinds. An inquiry was recently received from this firm by the Vancouver Board of Trade, stating that they are in the market for sufficient western pine to make 30,000 ironing table tops.

Wattman Car Bodies, Limited, Toronto, was recently incorporated to take over the William H. Wattman Car Body Company and to manufacture and deal in automobile bodies, carriage bodies, furniture and other wooden products. Capital, $50,000. Two of the incorporators are C. H. Weir and E. G. Black, barristers, both of Toronto.

The Collingwood Shipbuilding Co., Limited, Collingwood, Ont., recently held their annual meeting at which officials were elected for the coming year. The following comprise the personel: President, H. B. Smith; vice-presidents, J. W. Norcross and R. N. Wolvin; directors, H. W. Cowan; F. S. Izzard; S. Dyment; J. S. Leitch and S. H. Lindsay, secretary-treasurer.

La Compagnie P. T. Lagare, Limited, Montreal, P.Q., was recently incorporated with a capital of $5,000,000 to take over the interests of P. T. Lagare, Limited. This reorganization is said to affect the parent company only. Other subsidiary firms of the Lagare interests include the Star Phonograph Co. of Quebec, the Dominion Carriage Co., and the Lagare Automobile & Supply Co.

The National Association of Upholstered Furniture Manufacturers will hold their annual meeting at White Sulphur Springs, West Virginia, on April 27th and 28th. Owing to the unsettled conditions which prevail, an unusual amount of interest is being taken in this gathering and a large number of reservations have been made. It is anticipated that the attendance will be unusually large.

The Second Annual Safety Convention will be held at the King Edward Hotel, Toronto, on April 27th and 28th. A number of papers of interest to employers of labor will be presented, dealing with such subjects as "How to Interest the Employee in Safety," "Workmen's Compensation," "Falls and Falling Objects," and "Safeguarding Machinery," etc. In all a very interesting program has been arranged.

J. R. Eaton & Sons, Limited, of Orillia, Ont., are now operating under a federal charter. The change from provincial to federal charter was made some time ago as the firm found that it would be more practical for them to be incorporated under a Dominion charter as they sell their products in all of the provinces. The move has not meant any re-organization, but simply expansion and increased production.

The annual meeting of the Office Furniture & Supplies Co., Limited, Brockville, Ont., was held recently. The following are the officers and directors elected for the ensuing year: T. Sisman, Aurora, Ont., president; W. H. Comstock, Brockville, vice-president; H. K. Bowes, Brockville, managing-director; and G. W. Fowler, Ottawa, Capt. McVittie, Toronto, J. G. Gardner and W. B. Reynolds, Brockville, directors.

The large manufacturing plant which Knox Bros., Limited, Montreal, recently acquired at Levis, P.Q., has been put into operation. In this plant the company have one of the best-equipped working plants in Eastern Canada. The equipment is thoroughly modern and up-to-date, and includes a number of Yates high speed matchers. This plant will be devoted largely to milling in transit, dressing stock and the production of mouldings and finish.

Oil for heating purposes is probably a new development in the woodworking field. The LePage Individual Communion Cup Co. of Toronto, manufacturers of the LePage Silvertone Phonograph, recently discarded their coal heating plant, replacing it with an oil system. This makes a very economical installation as not only does the fuel cost less but the services of a stoker are dispensed with and the storage space, formerly required with coal, is available for other purposes.

The Service Motor Truck Co. of Wabash, Ind., who recently acquired a factory site at London, Ont., at a cost of $50,000 have notified the Chamber of Commerce, London, that construction work on their new plant will begin some time in June. The plans call for three buildings, 110 x 300 feet, together with a power house. It is expected that several hundred men will be employed by autumn. This new factory is intended to take care of both the Canadian and British export business.

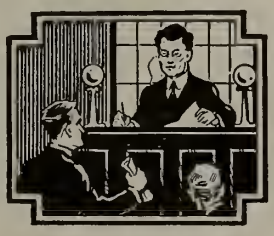
W. R. Smith, formerly of the firm of O. & W. R. Smith and Ivan Welsh, who have been running the Royce Ave. Planing Mills, Toronto, have formed a partnership under the name of Smith & Welsh and taken over the premises and storehouse of the Yonge St. Lumber Co., 2219 Yonge St., Toronto, which yards have been closed for some years. Smith & Welsh have stocked and re-opened the lumber yard and will eventually move the machinery from their Royce Ave. plant to their new location.

At the annual meeting of the Victoria Builders' Exchange, held recently in Victoria, B.C., it was predicted that the coming spring would see the commencement of a building boom. Drastic cuts in the price of paints, oils, plumbers' supplies, lumber and glass would, it was maintained, stimulate construction of all kinds. Last year the total permits issued amounted to $1,207,572, as against $526,141 for 1919. House-building was confined largely to small dwellings, built under the Soldiers' Housing Scheme.

Henry Ford, the well-known Detroit automobile manufacturer is very optimistic with regard to the immediate

ATCo
MEMPHIS
SOUTHERN HARDWOOD LUMBER & VENEER

"The works of a man are his mark of achievement"



We rest our case on a long, proud record

THE accumulated evidence of basically superior hardwood lumber and veneers, well manufactured and marketed efficiently, fairly and obligingly, over a period of many years, has given us a standing among the wood-using industries in which it is not vanity to be proud. Our methods and product are the kind that build up business traditions and a list of customers who are friends and remain faithful year after year. Come to us for your requirements in southern hardwoods, lumber, veneers and ply wood, and test the evidence of our perfect service.

THE ANDERSON-TULLY COMPANY
MEMPHIS

HIGH GRADE QUARTERED OAK AND SOUTHERN HARDWOODS ~ VENEERS AND PLYWOOD

future. He states that indications are everywhere manifest that the bottom of the business depression has been reached and that the trend of industry is now definitely upward. Also that his company had received orders for 80,000 cars during March and that 90,000 were booked for April delivery. He felt that the time would not be far away when this mammoth plant would be running at full capacity.

Fuller Brush Company, Limited, Hamilton, Ont., have been incorporated to manufacture and deal in brushes, mops and other wooden articles. Capital, $50,000. C. V. Langs and G. V. Binkley, barristers, both of Hamilton, Ont., are two of the incorporators. This is a branch of the Fuller Brush Co., Hartford, Conn. A plant is to be installed at Hamilton, Ont. It is expected that manufacturing operations will be in full swing by fall. At the start about 100 men will be employed but this number will be rapidly increased.

The Port Hope Veneer Factory, Port Hope, Ont., is preparing for a busy season. They are devoting their attention largely to the manufacture of fruit and berry baskets and are cutting a large quantity of stock in advance. This firm was reeently re-organized with Bert Janes as manager and Mr. Cornfoot as superintendent. The cloudburst and flood which recently visited Port Hope and vicinity, carried away some logs and a quantity of basket bottoms which were being air-dried, but did not interfere with the operation of the plant.

The Inside Woodworkers' and Factory Workers' Union of Ottawa are making new demands upon their employers. The increase asked for amounts to 15c per hour, and would bring the rate up to 75c an hour for inside men and 45c an hour for outside workers. It would appear as if the Ottawa workers are very ill-advised in making this demand at the present moment as conditions do not warrant an increase in wages, and business is such that the plants could be operated with greatly reduced staffs and at reduced time and still keep up with the demand.

A framed picture of an exceptionally fine inlaid table was recently presented to the Bytown Museum, Ottawa. This table, which is the work of the late J. A. B. Hannum, shows a bird's eye view of the well-known E. B. Eddy plant as it stood in 1870, and is considered to be a wonderful piece of work. The table top contains over 100,000 separate pieces of wood of 19 different varieties. The shades of the different species are used to outline and give the dark and light effects. It took Mr. Hannum five years, working during his spare time, to complete this piece. The table is oval-shaped and stands on a carved solid pedestal.

Giddings, Limited, of Granby, P.Q., report that a fairly satisfactory volume of business is offering. The plant is housed in a large five-storey building having a floor space of 3,800 feet and gives employment to about 100 hands. From 8,000 to 10,000 chairs are manufactured each month, while the output of baby carriages is between 5,000 and 6,000 annually. A considerable amount of export is done, many of their baby carriages going to the West Indies, while about 60 per cent. of the cane and wood-seated chairs are shipped to New Zealand and South Africa. The officials of the company are Herbert Giddings, president; W. F. Giddings, vice-president; O. B. Giddings, secretary-treasurer and Chas. Wilson, factory manager.

A merger was recently concluded between the well-known chair manufacturing firm of Heywood Bros. & Wakefield Co. of New Jersey, and the Lloyd Mfg. Co., of Menominee, Mich., the patentees of the Lloyd loom and manufacturers of machine woven fibre furniture and baby carriages. The amalgamated company has been incorporated as Heywood-Wakefield Co., of Massachusettes. The business of the Lloyd Mfg. Co. will be carried on as usual, as the reorganization does not mean any change in policy or sales plans. Marshall B. Lloyd, who is president of the Menominee firm has been added to the directorate of the Heywood-Wakefield Co. and will continue to act as manager of the Menominee plant. The Heywood-Wakefield Co. has been capitalized at $13,000,000.

Personal

F. T. Cliff of the B.C. Manufacturing Co., Limited, New Westminster, B.C., box manufacturers, visited Toronto and Montreal recently while east on a business trip.

H. L. Pease has been appointed secretary of the National Association of Box Manufacturers to succeed W. D. Burr who resigned recently. Mr. Burr has accepted a position with the Chicago Mill & Lumber Co. of Chicago.

J. R. Kennedy, formerly manager of the Port Hope Lumber & Veneer Co., has been appointed representative of the Freiberg Mahogany Co. of Cincinnati and New Orleans. He will handle their line in Canada and the eastern part of New York state.

T. E. McKenzie of the Seaman, Kent Co., Limited, Toronto, left recently for Winnipeg where he will hold demonstrations showing the possibilities of hardwood flooring. These will be held in connection with the building material exposition which is being held in that city.

George Dixon, an employee of the St. Mary's Wood Specialty Co., St. Mary's, Ont., met with an accident recently in the plant of this company. While attempting to replace a belt on a saw pulley, his left hand became caught in the rapidly-moving belt, with the result that his arm was fractured and dislocated at the elbow.

W. W. Butler, president of the Canada Car & Foundry Co., Limited, Montreal, left for England recently in an endeavor to secure some large orders from two British concerns. Owing to the fact that the Canadian railways are not purchasing new equipment, this business is needed to keep the shops of the company operating.

Charles C. Dickenson, vice-president and general manager of E. Sondheimer Co., of Memphis, Tenn., sailed on the "Celtic" from New York on April 2nd, for an extended European trip. Mr. Dickinson will visit England, Scotland, France, Belgium, Italy and Holland, to study the hardwood lumber markets and general conditions in those countries.

W. J. Egan, Canadian Trade Commissioner to South Africa, recently returned from a trip to West Africa where he had been investigating the trade possibilities for the Canadian Government. Mr. Egan visited Algeria and the Gold Coast colonies and found that both these countries offer a market for Canadian goods. At a later date it is probable that a trade commissioner will be appointed to act in this field.

Obituary

N. Beneteau recently passed away at his home in London, Ont. Mr. Beneteau conducted a large carriage factory in London some 15 years ago.

J. Smythe Kerr recently passed away at his home in Ingersoll, Ont. Mr. Kerr had been a life-long resident of that town where he for many years conducted a carriage factory.

G. J. Foote recently passed away at his home in Owen Sound. Mr. Foote had been foreman finisher for the North American Furniture Co., Limited, for the past seven years. He was very popular in sporting circles and managed the North American Furniture Company's baseball team, which won the Owen Sound championship last season.

P. H. Yawman, president of the Office Specialty Mfg. Co., Limited, Newmarket, died recently at Rochester, N.Y. As a mark of respect, the factory, head office and branch stores throughout Canada were closed for two days. Mr. Yawman was of an inventive turn of mind and was responsible for many of the improvements and refinements to office equipment which have tended to revolutionize this industry.

Catalogues, Pamphlets, Etc.

A number of interesting pamphlets have been issued recently by the British Aluminium Co., Limited, 263 Adelaide St. W., Toronto. These are four in number and are entitled; "Aluminium in the foundry," "Aluminium spinning and press work," "Aluminium machine shop practice" and "Aluminium finishing processes."

The National Association of Cost Accountants has just issued as Volume II No. 10 of its official publications, "A Bibliography of Cost Books." This bibliography probably contains the most complete list of cost books which has been published in this country. It is limited to books, it being the intention to cover pamphlets and other material in a supplementary bibliography to be issued later. The bibliography is divided into five sections—one containing books devoted to the general field of costs; one to books on accounting and auditing which contain sections dealing with costs; one to books on industrial engineering with sections on costs; one to books on costs for particular industries, this section being divided into the leading industries; and one dealing with special phases of cost accounting, such as overhead, depreciation, etc. In all, about three hundred and fifty titles are listed. Copies of this volume may be secured from the National Association of Cost Accountants, Woolworth Building, New York. Price 75 cents.

One reason why our Gum is Straight and Flat

Super Hardwoods

In all lines of business, we find the product of some one or two manufacturers excelling that of all others engaged in the same line of business.

Such excellence is usually the result of painstaking care, close attention to details, and a sincere desire to best serve the interests of the ultimate consumer.

We wish we could take every user of hardwoods through our operations, show them the difference between the methods we employ and those in general use, the extreme care that is exercised, the resulting difference in the quality and dependability of the product.

It is not by chance that a "quality product" is created. It is the fruit of honesty, thoroughness and hard work.

KRAETZER-CURED Gum; the only kind that is BRIGHT, STRAIGHT and FLAT.

Oak, Ash, Tupelo and Cypress of the very best.

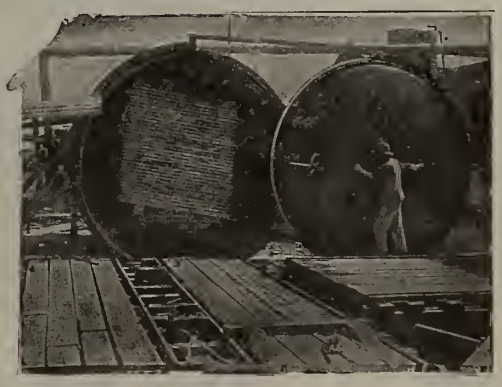
Every board bears our brand.

Our protection THE KRAETZER-CURED LUMBER CO. *Your guarantee*

The Kraetzer-Cured Lumber Co.

GENERAL OFFICE: GREENWOOD, MISS.

Band Mills: Greenwood, Miss., Moorhead, Miss.



Why our Gum does not stain

Our Quartered and Plain Red and White Oak, Ash, Hickory, Red Gum and Tupelo are as fine as the highest quality of virgin timber and thorough knowledge of production can produce. THERE IS NONE BETTER.

Business is on the Upturn

A Message from the Associated Advertising Clubs of the World

Business in Canada is getting its stride again.

It is going to set a steady pace it can keep. Swing along with it—the best is yet to come.

Recent months have marked a return to normal habits and wholesome standards. Business houses are in training to conserve strength and build up vital powers on a better, broader basis.

Prices have reached or are reaching stable levels.

Goods and services no longer sell themselves. They must be sold.

Good salesmanship is the order of the day. It is a help-the-buyer kind. It puts service on a par with profit. Its aim is to attract buyers by making buying attractive.

Merchants and all sellers are not merely getting business—they are building it on foundations of integrity.

Just recently the president of a national business spent thousands of dollars to apologize to the public for mis-statements in advertising published in hundreds of newspapers by his company.

He said policies of truth-telling and fair treatment must be maintained by his company at any cost, because he valued the confidence of the public and the good will of his business too much to have it impaired by wrong practices.

Legitimate business believes in "playing fair" and "dealing square." It aims to safeguard the interests of the purchaser in all transactions.

With the spirit of service as a guiding force, business is worthy of your faith on which its activity relies. There is the nub of the whole matter.

Canadian security lies not only in our mines, forests, factories and farms, but also in the work of our hands and the confidence in our hearts.

Let us turn these to constructive purposes, and enjoy a wholesome measure of prosperity.

Tool for Picking Up Nails

In crafts that call for rapid driving of nails, as in box making, much time is wasted getting the nails from the container and arranging them heads up. A patented tool now on the market is made like a small rake, with long, sharp-pointed teeth so spaced that the nails hang between them by the heads. When this is thrust into the container and shaken, it brings up its load of nails in position to be grasped by the worker's left hand, ready for driving, and saves his fingers from possible injury by the points.—Popular Mechanics.

Added impetus is given to the "Made-in-Canada" propaganda by the fact that the people of Canada paid $100,000,000 in exchange during 1920 on goods purchased in the United States. No value was received for this vast expenditure. By purchasing Canadian-made products, the housewives and buying public of Canada are providing steady employment for their men folk at remunerative wages.

Don't wait until the foreman loses his temper and is on the verge of discharging you before you take an interest in your work.

MACHINERY
For Sale

At Meaford, Ont.

One Berlin Circular Resaw No. 261, in first class condition.
One Car Pulley.
One American Trim Saw. This machine is all iron and countershaft attached to machine. The saw travels forward by means of a foot lever.
One Sherman Trim Saw. A light compact machine suitable for small stock; machine in good condition.
Two American 12" Scrapers with extra blocks.

At Ste. Agathe Factory

One Whitney 15" Scraper, with extra blocks.
One Large Circular Saw Grinder, with handle. Saws up to 36" dia.; machine in good condition.
One American Slat Ripping Machine.
One Berlin Circular Resaw No. 261. The machine is as good as new.

At West Lorne Factory

S. A. Woods 12" Inside Moulder No. 107; practically new; a large quantity of moulding knives along with the machine.
Two Canada Machinery Co. Lighting Cut Off Saws No. 638, practically new.
One Sherman End Matcher, with extra pair of heads.
One Car Pulley.
One S. A. Woods Outside Moulder No. 131. This machine was purchased from S. A. Woods last July and is as good as new.
One American Double Surfacer No. 15. This is a heavy machine equipped with thin high speed knife cylinders 30" knives, broken rolls.
One Sawyer Massey Portable Saw Mill, saw frame and carriage 52" inserted tooth saw and friction feed, carriage is fitted with three heads, left hand mill.
One American Scraper Knife Grinder.
One No. 7 Sturtevant Forge Blower, in good order.
One Double Emery Wheel Stand.
One American, Self Feeding Rip Saw.

At Toronto, Ont.

One Canadian General Electric Generator 35 K.W.D.C. on adjustable No. 8241. Class 6-35-1150. Form B. Volts 120 no load. 125 full load, amperes 280, revolutions 1150 in good condition.
One Canadian General Electric 24 x 80 x 2" Blue Vermont Marble Switch Board (H.E.N. 12933) Type C/D G&F 80 amperes, 350 volts, 125 or 1½" pipe frame and mounted as follows:
One R.P. Volt Meter 0 to 140 volts.
One R.P. Ammeter 0 to 400 amps.
One Pilot Light brass goose neck.
10-35 Amperes Double Pole, single throw knife switches with enclosed fuses.
One 350 Amperes ditto.
One 60 Amperes ditto.
One 30 Amperes ditto.
One Steam Duplex Pump 12 x 9 x 9½" in good condition.
Two Whitney Scrapers 15" in good condition.
One American Scraper 12" in good condition.
One Brown Handle Boring and Chucking Machine.
One Bartlett Shaving Hogg.
One American Scraper Knife Grinder without countershaft.
One 12" Peerless Belt Lacing Machine in good repair.
One Shimer & Sons of Milton, Pa. Hand Box Matcher in splendid condition.

Dry Rot of Timbers

As applied by many persons any decay which is found in wood in a comparatively dry situation is called dry rot. Thus loosely used, the term actually includes all decay in wood, since wood kept sufficiently wet cannot decay. To the pathologist the term dry rot means a certain fungus, (merulius lachrymans,) which gains its distinction from the fact that it is frequently found growing in timbers without any aparent moisture supply. In reality it does not grow without moisture and is as powerless as any other fungus to infect thoroughly dry wood, according to the Forest Products Laboratory. Given moist wood in which to germinate, it is able to make its way a surprisingly long distance in dry timbers, drawing the water it needs from the moist wood through a conduit system of slender minutely porous strands. Wood in the typical advantage stage of dry rot is shrunken, yellow to brown in color, and filled with radial and longitudinal shrinkage cracks, roughly forming cubes. In many instances these cracks are filled with a white felty mass, the interwoven strands of the fungus. The decayed wood is so brittle and friable that it can easily be crushed into powder.

The dry rot fungus is active in nearly every region of this country, United States, and in Europe. It is destructive to factory and house timbers and to logs in storage. Coniferous or soft woods are more commonly infected by it than hardwoods.

Stop the Waste
in Kiln Drying Lumber

Hand control of kiln temperatures and humidity results in warped and checked lumber, which means waste—(above cut is from photograph of oak planks, typical run of hand regulated kiln).

Automatic control of temperature and humidity, results in lumber evenly and thoroughly cured, without warping or checking. (Above cut illustrates average results from automatically-regulated kiln.)

The Powers Regulator automatically controls temperature and humidity, and saves from a quarter to a third of the time in kiln-drying lumber.

It Regulates Profits, Upwards.

Try it at our risk.

SIMONDS CIRCULAR AND BAND SAWS

In every mill or woodworking shop in the land the demand for greater production is urgent. Devious methods to secure the desired results are being tried out. Some are making good—some are not. They have the manpower, but they can't get production. Many mills and woodworking shops have discovered one of the greatest hindrances to efficient operation are poor saws and knives. The saws dull easily and do not hold their tension, while the knives lose their cutting-edge quickly and this results in unsightly marks on the lumber, and consequently damage.

Inferior saws and knives are being discarded by many, and in most cases Simonds Products are replacing them. There is no question about Simonds Saws and Knives. They are made of the finest steel obtainable, hardened and tempered right and make mechanically perfect. They produce smooth lumber and cut down your operating expense.

Write for catalog and prices.

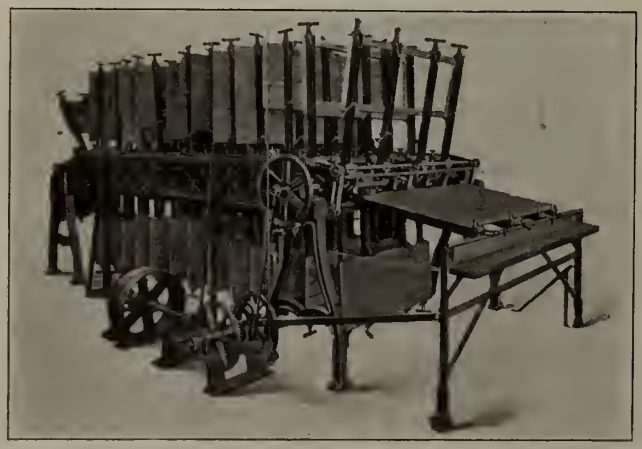
One Man Does the Work of Two
with a Billstrom Glue Clamp Carrier



For every plant where much edge-gluing is done there is a real need for a Billstrom.
Here's why:—

The empty clamp is held at just the right height for the greatest convenience of the workman.
When the clamp is filled he pulls a cord, which carries the filled clamp away and deposits an empty one in its place.
One man can accomplish as much by using it as two men can do employing the old methods.
It holds the work off the floor until the glue has set, when the glued stock can be quickly removed and piled flat, thus greatly conserving space.
It reduces the labor and cost of edge gluing to the minimum.
There is a sizs to suit your particular requirements.

N. J. BILLSTROM
2002 NINTH ST. ROCKFORD, ILL.

44 Yates No. 275
36 and 66-in. Automatic
Knife Grinders,
Brand New, at
One-half Price

Machines arranged for Motor Application as per cut, or regular belt drive, if wanted.

We have in Cincinnati, available at once, three Whitney 30-in. single surfacers and two Whitney 30-in. double surfacers, all with sectional rolls; three double arbor revolving saw tables; three single arbor tilting table saw benches; F.&E. single-end tenoner with roller table, and a few other choice machines. All are in exceptionally fine condition—are doing precision work at the present time.

7 New Hermance Molders, 8, 10 and 12-in., Stationary and slip-on heads.
8 New Andrew Multiple Vertical Borers, 20, 30, 42 and 60-in., any number of heads.

Band saws, 32, 36 and 38-in.
Borer, Andrew, 10-ft., 13-spindle, power table.
Borers, Andrew mult. vert., 20, 42 and 60-in., new.
Door clamp, Fay-Egan, heavy.
Door clamp, Jenkins-Hayes power-feed.
Edgers, two, three and four saws.
Glue cookers and retainers.
Jointers, 8, 12, 16, 20, 24 and 30-in.
Lathes, speed, eight, mounted on iron bed.
Lathes, turning automatic, Mattison No. 8
Yates No. 72, practically new.
Matcher, American Northwest, 24x8-in., 3 sides.
Matcher, 24x6-in., 3 and 4 sides.

Molders, 4-side, 9, 10 and 12-in. American.
Molder, Fay & Egan, 12-in. outside, heavy.
Mortiser, chain saw, New Britain No. 7, new.
Mortisers, F. & E. vertical, hollow-chisel; also plunger type; Greenlee vertical, double hollow-chisel.
Nailers, two, Hayes, 8-track, 8d, closed back.
Nailing machines, 2 closed back, 4-track, 4d, 15-in. spread, Hayes' make.
Pony planers, 16, 20 and 24-in.
Rip saws, self-feed, Hoosier, F. & E. Greenlee.
Rip saw, gang, Luther, for box work.
Router for stair stringers.
Sand belt, closet seat and similar work.
Sander, H. B. Smith, spindle and disc, practically new.
Sanders, 30- 42 and 54-in. Columbia; 30, 42 and 48-in. Invincible; 30 and 36-in. F. & E. double.
Saw, 8-ft. double cut-off, roller table.
Saws, combination and variety, single and double arbor, also tilting arbor, stationary and tilting table, 24 and 30-in. circular resaw.
Saw, circular re-slab, 40-in. blade, power feed rolls.
Shapers, Fay single-spindle reversible, also Shimer single with overhead routing attachment.
Shaper, Whitney No. 7 and 8 double-spindle, practically new.
Surfacer, 30-in. double, cabinet, B. & M., practically new.
Surfacer, Whitney 30-in. double, sectional roll and sectional chipbreaker; American No. 4½, 36-in. sectional and solid; Fay & Egan No. 140, 27 and 30-in. double divided rolls; also 18, 20, 24 and 30-in. single cylinder panel planers.
Tenoners, Fay & Egan double-end, also single-end.
Window frame machine for production work, new.
Window frame machines, Smith & Phillips combination.
Wood-worker, universal, Fay & Egan and Bentel & Margedant. One lot of glue room machinery.

We have just received two carloads of Band Saws and Jointers—all new—which are ready for immediate delivery.
Band Saws, 20, 26, 32, 36 and 38-in. Jointers, 8, 12, 16 and 24-in.

Queen Anne Leg *Turning* and *Sanding* Machines

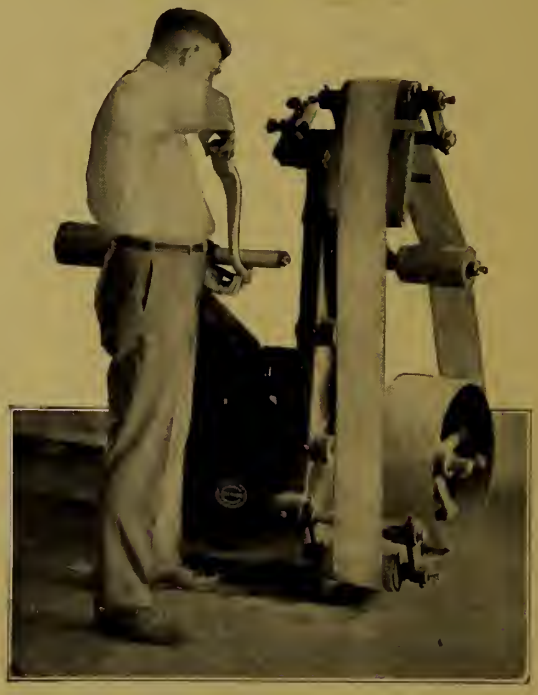
HERE is a real machine method for shaping and finishing legs of Queen Anne design.

The Mattison Automatic Leg-forming Lathe is built specially for furniture work; all details of mechancial construction have been perfected to insure accurate and economical production.

A shear-cutting head takes care of all patterns. The cutting operation is purely automatic, which reduces the labor cost to the actual time required for changing stock. The man who looks after this lathe can also attend another nearby machine; or he can keep three or four of the leg forming lathes busy.

Still another practical and time-saving combination is to have the Mattison Variety Belt Sander set near the lathe, which enables the one operator to sand a leg while another is being automatically cut in the lathe.

New Application of Pneumatic Sanding Drums, Combined with Flexible Sand Belt, Provides a Quick Method for Perfectly Finishing Queen Anne Legs



THE Mattison Variety Belt Sander is a self-contained finishing machine, requiring small floor space. It is well adapted for perfectly sanding in one handling the many curves and irregularities of a Queen Anne leg.

By free-hand manipulation of the leg diagonally against the open sand belt, shaped forms or cushioned sanding rolls, the rough sanding is accomplished very quickly.

The two sizes of pneumatic, sand-covered drums, or spindles, provide a most practical and accurate method for perfectly finish-sanding the legs.

This combination of both rough and finish sanding operations in the one machine, together with the lathe for automatically shaping the legs, gives the manufacturer of Queen Anne furniture a method that minimizes cost and insures accurate production of his individual and distinctive patterns.

Send for Bulletins describing this method in detail

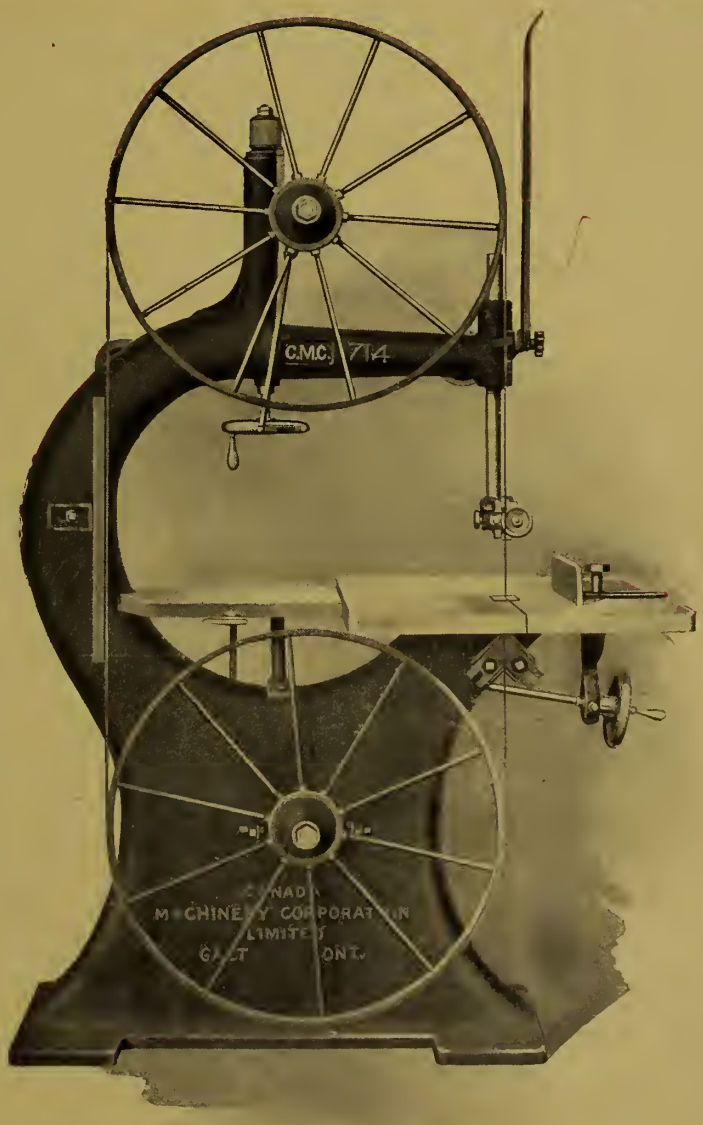
CANADIAN WOODWORKER and Furniture Manufacturer

C.M.C.

No. 714, 36" Band Saw

With Steel Wheels

SPEEDY, ACCURATE, CONVENIENT



A very popular saw for medium or light scroll sawing in pattern shops, furniture factories and manual training schools. It is easily handled and is found especially useful for working with small blades.

The table may be tilted to an angle of 30 degrees and held rigidly in place. It is equipped with an adjustable splitting fence 15" long. A Wright guide, one of the most efficiency guides yet designed, is regularly supplied with each machine.

IT'S JUST LIKE THROWING MONEY AWAY

To Use an Inefficient and Unreliable BELT

STOP IT!

You Can SAVE MONEY By Using

D. K. McLaren's Genuine British OAK TANNED Leather Belting

SOMETIMES you hear a man complain that belting is expensive. Investigate and you will invariably find that he has never used a really worthwhile belt—his has been of the cheaper grade, continually stretching, breaking, losing power and causing frequent break-downs.

Belting of that type is, and always will be expensive. Belting costs cannot be figured by the price-tag, but by the ultimate service the belt will render.

Fortunately, most woodworkers know the truth of this so that good belting is the rule and not the exception in the average plant. And it is a significant fact that with the busiest and most progressive of these, D. K. McLAREN'S GENUINE BRITISH OAK TANNED BELTING is the kind used. Our organization is at the service of belting users everywhere to advise them in the selection of the right belt. Can we be of service to you?

Invest In Your Own Business

These machines will save you money. They are priced to sell under present conditions. All in our Dufferin Street Warehouse, subject to your inspection. Quotations on machines for any purpose on request.

1—McGregor-Gourlay Double Arbor Universal Saw Table, same as C.M.C. No. 618, with 14" saws, self-contained countershaft, full complement of gauges, saws, wrenches, etc.

1—Preston No. 127 Variety Saw Table, countershaft attached, one 14" saw.

1—Ballantine 36" Band Saw, with solid lower wheel, complete with saw blades, wrenches, etc.

1—Ballantine Two Spindle Shaper, Spindles 20½" centres, diameter of spindles where collars go on 1⅛", top 42" x 42".

1—American No. 1 Single Spindle Shaper. Fig. 937 with plain countershaft.

1—C. M. C. No. 507 Mortiser, with boring attachment.

1—C.M.C. No. 624 Hand Feed Rip Saw Machine, with self-contained counter shaft, table 6'6" long by 40" wide, with plain box gauge, 22" saw blades, 1¼" arbor with cone for receiving saws different diameter.

1—Ballantine 8" Four Sided Moulder, complete with square heads and straight knives on all heads.

1—American No. 2½ Single End Tenoner, with two copes and cut-off saw attachment. Fig. 9431 in American Woodworking Machinery Catalog.

1—C.M.C. No. 646 Roller Table Cut-off Saw, sliding table 7'6" long, stationary table 50" to the saw, sliding table equipped with stop gauge, including five stops, with countershaft, complete with saws, wrenches , etc.

1—Cowan Combination Vertical and Horizontal Boring Machine, complete with wrenches, etc.

1—Hespeler 12" Buzz Planer, fitted with round cylinder, full set of knives, countershaft, wrenches, guard, etc.

1—Preston 36" Band saw, lower web wheel and guards.

8—Sections Cowan Four Screw Veneer Press 12"x50", four sections 27" clear space under screw plates, four sections 32" under screw plates.

1—24" Francis Double Roll Glue Spreader.

4—Sections Cowan Three Screw Veneer Press 38"x12", 28" clear space under screw plates.

1—American No. 4½ Single Surfacer, with solid roll and chipbreaker.

1—American No. 26, 10" Outside Moulder, 4" side heads, latest type machine, complete with knife jointers and all equipment, new straight knives on all four heads.

1—C.M.C. Arm Sander, No. 438, with paper cutter.

1—Universal Knife Grinder, 37", made by American Wood Working Machinery Co., Fig. 1126 in their catalogue.

1—60" Sturtevant Single Slow Speed Exhauster, left hand, top vertical discharge, complete with platform and rods to suspend from ceiling.

1—Cowan Chain Mortiser with grinder.

1—Ballantine 36" Band Saw, lower web wheel.

1—American No. 3 Double Cut-Off Saw, new machine, capacity from 8" to 6' 9" in length, 4" thick and 30" wide.

1—American No. 25 Edging and Ripping Saw, new machine.

1—American No. 30 Double Arbor Universal Saw Bench, new machine.

1—Preston 24" No. 121 Pony Planer, used only couple of months.

1—McGregor-Gourlay 24" Pony Planer.

1—Mershon Band Rip Saw.

CONDIT

No Power Circuit Should be Broken with a Knife Switch

Condit Type N-2 Oil Switch

Condit Type 1 Oil Starter

By using Condit Oil Starters and small industrial Oil Switches to protect small motors and small power and lighting circuits in woodworking plants, the fire hazard is eliminated and many delays caused by trouble with small motors not properly protected, is avoided. When a circuit is opened, the arc is under oil which immediately extinguishes it. Thus, serious trouble very often caused by knife switch blades burning in ways which prevent proper contact and allowing a three phase motor to operate on single phase, is obviated.

CONDIT: *the Synonym of Safety in Electrical Protective Equipment*

Yates

TYPE C-4
THE
MASTER MOULDER

Will increase the production of your plant. How?

Quick—will run mouldings up to 100 feet per minute.

Accessible—entirely open side from end to end—set ups quickly and easily made—gear guards and hoods easily removable—control devices at operator's finger tips.

Compact—takes up less room than the old sticker.

Durable—base is cast in one piece, flaring at the floor line eliminating vibration so disastrous to the production of fine mouldings, also increases the life of the machine.

These are but few of the features—truly a master machine.

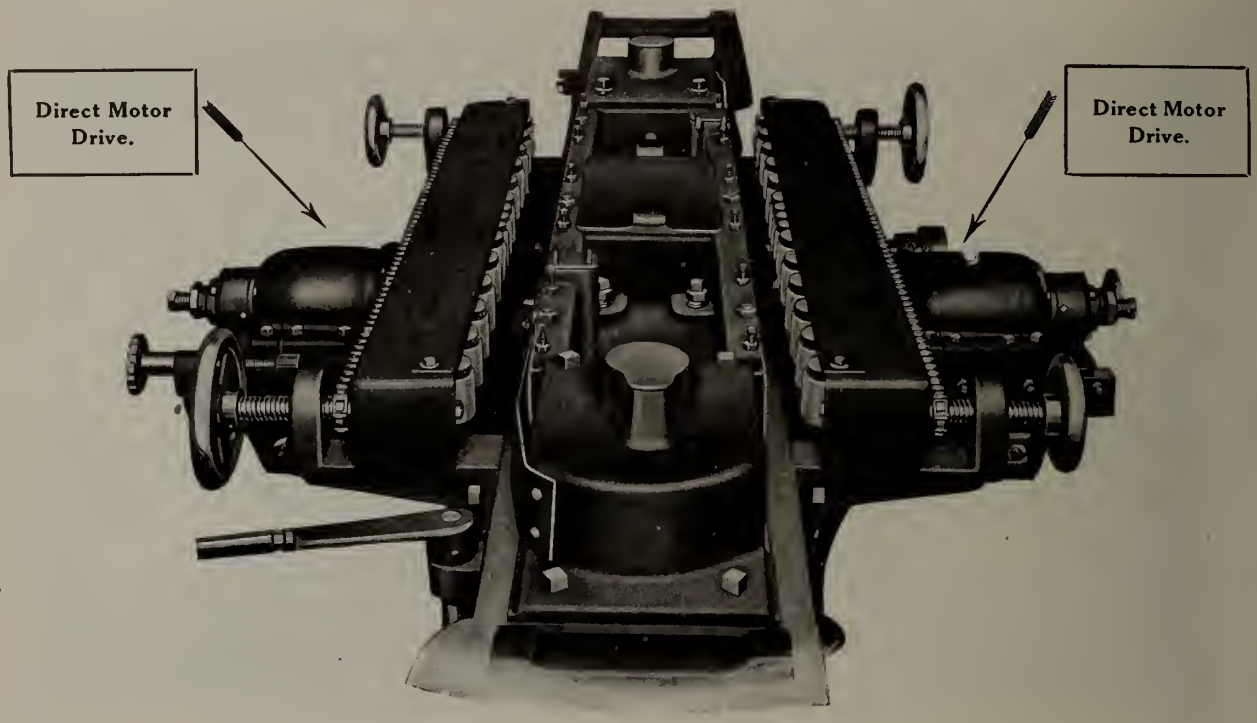
The C-4 is one of the most useful machines.
Look it up—you'll be glad you did.

P. B. Yates Machine Co. Limited

Hamilton - Canada

Ball Bearing Direct Motor Drive Glue Jointer and Edge Molder

No Belts **No Countershafts**



No. 429 "Lightning" Automatic Glue Jointer and Edge Molder

With a continuous feed this machine will make the finest glue joints for the highest class of cabinet work many times faster than is possible by hand or on the old reciprocating types. It is the ONLY Automatic Glue Jointer which can be set instantly to make either a straight, hollow or spring joint.

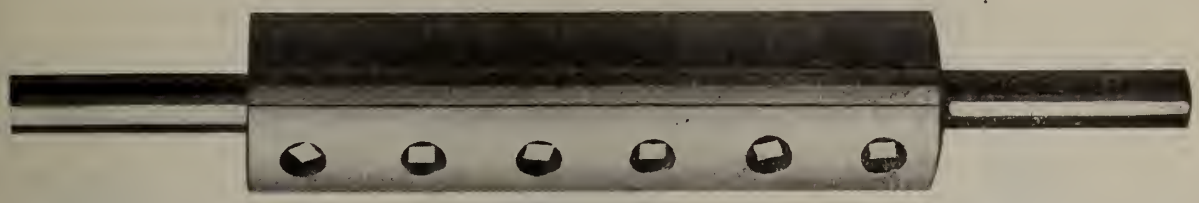
The Shimer Round Safety Cylinder with High Speed Knives



A Round Safety Cylinder that will Appeal to the Buyer and the User for three Reasons:

The first is our adjusting nut for setting the knives. It is the only cylinder with properly located adjusting nuts for setting the knives, which, with our way, can be set to 1-1000 of an inch.

The second is our way of holding the knife without tapping into the head.

The third is the correct angle of cut for the knives.

Made for Any of the Different Makers' Machines and in Any Length Cylinder.

The Handiest Machine on the Market

The Split-tilting table (Patent Applied For) can be tilted and locked at any angle up to forty-five degrees as indicated on the graduated segment. This machine is also supplied with a solid table. The Boring Attachment is very complete in itself. A foot lever is connected with the table which slides back and forth on the knee. A large coil spring located in the column of the machine automatically releases the work from the bit when pressure is removed from the foot lever. The Boring Attachment is raised or lowered by means of a handwheel connected with a pair of mitre gears. The spindle is bored to take standard size bits and can be arranged for a hollow chisel mortiser. Special cutters may be used by removing the throat in the table. Each machine is furnished with one ten inch saw, belt and wrench.

Write for prices and pamphlet describing this time and labor saver more fully.

The Powers No. 15 Regulator

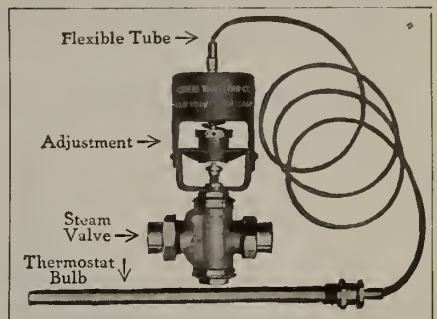
Here is a regulator that will control your dry kiln, or your varnish room, or other similar process, saving fuel and improving product.
Send for Bulletin 138.

Responsibility is irksome to some men—routine to others.

Automatic control of temperatures relieves men of both responsibility and routine—it helps to relieve the "spirit or unrest," which seldom occurs where tasks are not irksome.

Some of the Causes!

Begin now to eliminate some of the causes of discontent by putting Automatic Heat Regulators on your dry kilns, ovens, varnish and dry rooms, heating systems, hot water tanks, shower baths—and every place where heat control is desired.



The Powers Regulator No. 11

Specially adapted for the control of liquid temperatures as in hot water tanks, glue pots, dry kettles, etc. Entirely automatic and self contained requiring no outside power for operation.
Send for Bulletin No. 129.
other designs for other uses, wherever heat control is desirable.

Powers Heat Regulators

These accurate, dependable machines positively and automatically control the heat at the point of use. Their economy is fourfold.

1. They save labor by releasing men who now attempt to control heat by hand.
2. They save material by preventing losses from spoiled or sub-standard output.
3. They save fixtures by preventing overheating.
4. They save fuel by using only necessary heat.

We have spent more than thirty years in studying temperature control and have gained a vast fund of practical information which is cheerfully at your service.

The Canadian Powers Regulator Co., Ltd. SPECIALISTS IN AUTOMATIC HEAT CONTROL **82 Chestnut St., Toronto, Ont.**

The Mereen-Johnson Resaw

has many features of advantage which place it far ahead of anything in the Resaw field.

No pulleys—no belts—no frictions.

The sprocket and chain arrangement for changing speeds is only one of the many improvements on this machine.

Write for circular.

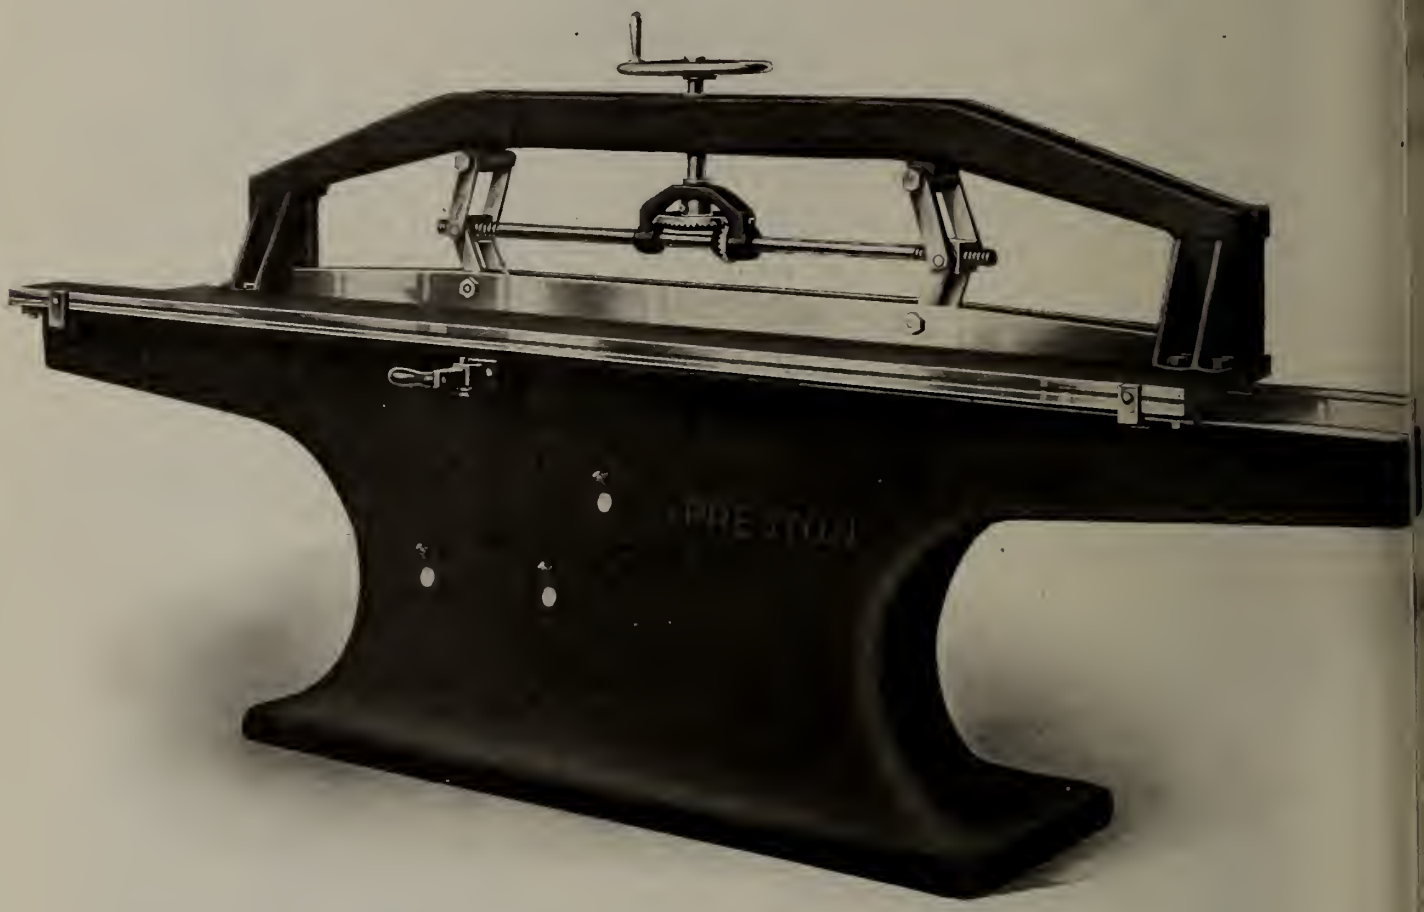
The only

VENEER JOINTER

that will effectively joint buckled veneer



No. 181 "Preston" Veneer Jointer

THIS MACHINE was designed and built for the purpose of making commercially perfect face joints butt or crosswise as well as lengthwise of the grain on the highest figured circassian walnut or crotch mahogany veneer.

One of the most essential features of a machine of this kind is RIGIDITY. Examination of the frame or column on above illustration will show the massive construction of same which is of cored section and cast in one solid piece. This guarantees absolute accuracy in the table Vee ways at all times, thus contributing to a perfect joint being made on straight or curly stock at one operation.

Eaglesfield "BELTLESS" SWING SAW

Announcing——

A new design with special high-torque small-diameter

MOTOR DIRECT ON ARBOR

In addition to the present type of EAGLESFIELD BELTLESS SWING SAW, motor gear-connected, which was put on the market in 1919, we now announce a new design, with motor mounted directly on 2-in. spindle—gears entirely eliminated.

With ample power for saws up to 24-in., this new design permits a range of cutting from the small shop requirements up to heavy-duty service in car shops and saw mills.

Motor connection takes up only 3½ in. of saw, leaving ample clearance—as on a 24-in. saw, 8¼-in. cutting surface is available. Saw can be trammed for more accurate cutting than you have been accustomed to.

The unified hanger construction, resilient spring action, and the 7-in. section column are identical with the gear-head machine.

Motor is of the enclosed, built-in type, 25 or 60-cycle, 2 or 3 phase, any voltage. Extra large size S K F ball bearings. Saw up to 24-in. included in equipment.

Made in Canada

Perkins Vegetable Glue

PERKINS 183 was the FIRST VEGETABLE GLUE ever sold to high grade woodworking concerns and PERKINS 183 is now the last word to be said of a HIGH GRADE, UNIFORM QUALITY GLUE. Much money and effort have been spent on work covering a period of years; many changes were made in the formula until the present manufacturing process of 183 was reached and for fourteen years this glue has successfully filled the requirements of HIGH CLASS GLUE. Both our research and factory laboratories are constantly working to improve manufacturing methods and we shall never be satisfied to give the trade anything less than the best.

The Home of

An Efemco Product

A "Rockless", Dependable Metal Bed Caster

The sturdy spring on the EFEMCO Metal Bed Caster has a four-point contact with interior of tube, holding the caster securely upright. The spring is forced together by the tube into which it fits, the grooved portion then forming a perfect bearing allowing the caster to turn freely.

The EFEMCO Metal Bed Caster is also made in the ball bearing and roller bearing types. Up to 1½" sizes it is finished with cupped washers. Above that size with leg mounts.

Made to fit tubes of the following sizes in iron pipe—⅞", 1", 1 1/16" 1¼" and 1½". Round tubing—1½", 1 9/10", 2", 2½" and 3". Square—1½", 2", and 2½".

We can supply this caster with maple, lignum-vitae, steel, iron or fibre wheels. It's a genuine EFEMCO Product and of the usual EFEMCO quality and dependability.

Write for catalog showing new lines of improved Efemco Casters.

Per-forming An Imper-ative Service

In no phase of our business is care more thoughtfully exercised than in the selection and training of men for their places in this organization.

The importance of this will be recognized by those who realize the value of fire prevention work.

Our insurance policy is not only a guarantee of prompt payment of fire loss, but it also carries with it a service that includes a regular fire prevention inspection on your property.

A thorough fire prevention inspection may save your property from destruction, and it will also assist a great deal in accumulating larger savings which will result in better insurance for less money.

THE WAY TO RESUME IS TO RESUME

Few topics have been so witlessly discussed as those having to do with post-war conditions, industrial resumption and price re-adjustments.

Every theory, idea and ism, however absurd, ridiculous and impossible, seemingly have found exponents, who have had only too ready an access to the channels of printed communication.

Communism, socialism, syndicalism, bolshevism in their purity and in every range of mixture, and by every device of camouflage have been served to the public.

The principal achievement registered has been expensive, hurtful, unnecessary delay.

One has waited for one thing, and another for another, the result being that few or none have got what they waited for,—the effect usually being that where one waited, he enforced a wait upon others.

Where one wheel is not turning, usually the whole machine is at a standstill.

If everyone waits for everything to get just right, all will wait forever.

Full activity upon a full program with full confidence that all will come out well, is the route by which to secure the surest, quickest return to complete normality.

The way to get others to resume is to resume ourselves.

Such is our policy; and we are aiding all our customers in this course by superior products, efficient service, and a genuine interest always in filling their requirements.

W. M. Ritter Lumber Co., Columbus, Ohio

Canadian Representative: John Hall, 160 Huron St., Post Office Box 32, Toronto

The Door Carrier System

Makes your dry-kiln doors steam-tight and saves time, heat, trouble and money.

Carrier lifts door clear of kiln and carries it down track. Returning, deposits door to rabbeted joint, where it is held steam-tight by its own weight. Applicable to old or new kilns.

Ask for catalogue.

Eastern Representative

Chas. T. McManus, 307 Brisbane Bldg., Buffalo, N.Y.

A High Standard of Quality and Service

The Big Opportunity Is Here

TO the manufacturer, the fact that present prices are lower than production costs, should be an incentive to stock up in Hardwoods before a sudden demand arises to snatch the opportunity away.

We need only point to the market reports to emphasize that prices will **not** be lower.

For the factory trade, we are enabled to ship at short notice any quantity of **Birch, Basswood,** or **Hard Maple.**

Anticipate the upward trend—get our quotations now.

Sawyer Goodman Company

Marinette - Wisconsin

Stimson Veneer and Lumber Co.

(Inc.)

Office and Mill: McLean Ave. and Union Belt R.R.

Memphis - Tenn.

We sell only the product of our own mills and make band sawn lumber in all Southern Hardwoods.

We specialize in Quartered White Oak, Red Oak, and Red Gum.

With allied companies we make fifty million feet annually.

- 10 cars 12/4" Log Run.

MAPLE
- 4 cars 12/4" Log Run.

THE above photograph was taken at one of our logging camps and illustrates the up-to-date equipment used in all our operations from the stump to the lumber on our yards.

The five Oak logs shown on the trailers are each 12 feet long and were all cut from one tree, the butt cut measured fifty-one inches in diameter. These five logs measured 6,489 feet.

We operate two modern band mills on our own timber, and manufacture all the lumber we ship, which enables us to furnish stock of even grade, color and texture.

We will appreciate an opportunity of serving you and will be pleased to quote you at all times.

Manufacturers of all kinds of high grade Southern Hardwoods.

MEMPHIS - TENN.

"The Canada Lumberman" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free duscussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements. Sample copy and full information on request. Head Office, 349 Adelaide St. West, Toronto.

Band Sawn West Virginia Hardwoods

Our timber, of virgin growth in Greenbrier and Pocahontas Counties, limestone soil, gives a combination of Texture, Quality and Character that is most desirable to the Woodworking trade.

The most critical Hardwood users are among our best accounts. Why?

The W. C. Barlett Lumber Co.

Charleston, W. Va.

A "Quality" you will admire
A "Service" you will appreciate

We have the facilities for giving Canadian Woodworkers and Furniture Manufacturers a prompt service on straight or mixed cars of the following:

Ash, Oak, Gum, Poplar, Hickory, Walnut, Chestnut, Beech, Maple, Elm, Sycamore, Cottonwood.

Soft textured Plain and finely figured Quarter-Sawn Red and White Oak our specialty.

"What Others Say"

"Your letter of February 15th received and we want to say that this was a very nice lot of lumber. It was good widths and lengths and well manufactured, dry stock and the grading was very liberal. We are sorry we cannot use more of this lumber at the present time. *We received several cars from other manufacturers at a cheaper price but the lumber was not nearly as satisfactory.* When we are in need of more stock we will take the matter up with you."

(Note—The above was sent us February 24, 1921 unsolicited. Name given on application).

BAND MILL AT LOUISE, MISS. GREENFIELD, OHIO

Full Stock
South Eastern Missouri
Soft Yellow Cypress

In offering this desirable material we wish to emphasize that it is distinguished from the Southern variety and is characterized by the fact that in the lower grades peck and shake are almost entirely lacking, small sound knots being the principal defect. Sound workable boards ars thus guaranteed.

Also in No. 1 Common and No. 2 Common we put this stock up in 6″, 8″, 10″, and 12″ widths, running practically all 14 and 16 feet.

Our full offering of this material should appeal to manufacturers of trim, coffins, boxes and other products using cypress where truly superior product would be appreciated.

In addition we offer as usual our well assorted stock of St. Francis basin hardwoods, sold on guaranteed grades. NOTHING PICKED OUT. Can surface or resaw as desired.

Waste—and Its Prevention

Waste is all too prevalent in the woodworking industry—waste of material, waste of time, of effort, of energy and of power. This constitutes a direct tax on all woodworkers and is reflected in manufacturing costs, resulting in a higher level of prices and affecting the demand for wood products. One is forced to the conclusion that in an effort to lower costs and prices, the elimination of waste is not given the attention its importance warrants.

Increased production per man, per machine or plant has been suggested as one of the panaceas which will result in lower costs and lower prices. There is little doubt as to the efficacy of this suggestion but the difficulty is that, at present, the demand is not equal to normal production, so that any attempt to boost the output will result in an accumulation of manufactured stock. This should not be taken to mean that efficiency is not as important to-day as it was yesterday or last year, for efficiency and economical operation is required now, as never before, even though it is found necessary to curtail production in conformity with general conditions. Because a plant is operating with a reduced staff and on part time is not any reason why every effort should not be made to eliminate all losses and keep manufacturing costs as low as possible.

Waste tends to maintain production costs at a high level, in normal as well as in abnormal times. If waste could be partially prevented or eliminated entirely it would have a marked effect on prices. A large percentage of the losses occurring in woodworking plants is preventable and can be done away with. This may be accomplished by educating the workmen, reorganizing manufacturing methods, putting power plant and equipment in a high state of efficiency, re-arranging the machinery and, if the saving involved warrants the expenditure, installing new production equipment and labor-saving devices.

Probably the most glaring loss occurs in converting the basic raw material—lumber, into the finished product. It has been estimated that the material loss in box factories averages from 17% to 25%; in the planing mill group from 25% to 35%; in furniture factories from 35% to 50% and in some special lines or on certain forms of special work the loss may run as high as 75%. These percentages, which are borne out by cost figures, are startling and strongly emphasize the need of making a greater effort to reduce the material waste.

Let us pause for a moment and consider how some of this loss occurs—time and space does not permit a detailed study of manufacturing operations but a few suggestions may start a train of thought that will lead to good results. In many instances some of it is accounted for by the fact that the grade of lumber used is not suitable for the work in hand, while another part of the loss is due to careless and improper handling. In unloading the stock from the cars, many pieces are broken, split and bruised, entailing a loss or waste. In piling, the different lengths are not kept separate, stickers not placed directly above each other and the piles are not protected from the weather. The result is warped, twisted and checked lumber. In the kiln, the drying operation is not given the attention it should receive, and as a consequence, the drying loss is heavy. Nobody will deny that such losses are preventable and the remedies are obvious. By following the work through each operation, one will be surprised at the number of times material waste can be reduced through the exercise of a little care and ingenuity.

Considerable prominence has been given recently to an organization known as "The Noble Order of Gloom Chasers." Undoubtedly we should be as cheerful and optimistic as we can. Another similar organization, equally important, that should be flourishing, might be called "The National Order of Waste Eliminaters." Each woodworking plant should have its section with every employee and official a member. Every person actively engaged in the woodworking industry should be so imbued with the idea of waste elimination that it becomes second nature to leave no stone unturned in an effort to reduce all avoidable loss. Eliminating waste and reducing costs to a minimum is a man's job and is worthy of the best efforts of the biggest men in the organization. A move in this direction will not be an unqualified success unless the co-operation of every employee is secured.

Elsewhere in this number will be found several interesting articles dealing with electric power, with special references to the problems peculiar to woodworking. This is a timely subject. Articles dealing with other phases of electric drive are scheduled to appear in coming issues.

Innovation in the Construction of Furniture

Providing Outlets for Attaching Electric Appliances Should Appeal to Purchaser —Suggestion Applicable to Many Pieces—Lightens Work of Housewife and Adds to Attractiveness of Home

[The accompanying article by a writer in "Electrical Merchandising" opens up a new line of thought and presents a practically untried field for development by the progressive furniture manufacturer. Would the suggestions offered, if worked out to a successful application, tend to increase the desirability and saleability of the pieces so wired? In attempting to apply these ideas, safety, calling for thorough insulation should be the first consideration. In all probability special outlets perhaps colored and grained to match the different woods, would have to be designed.—The Editor.]

Some day—by the time, perhaps, that every home in the land is a model "home electric"—we shall look back upon our ideas of to-day and realize that a mere skeleton or framework of the things that were to be, was even the most ambitious "home electric" of 1921. Nothing could be more complete, we think now, than the electric services presented in one of these homes. Electric kitchen and laundry equipment, electric dining room conveniences, and enough outlets to make possible the use of all the other household appliances —what more could the housewife ask to make her tasks easy and her home comfortable? For one thing —"electrified" furniture. And do you know what will bring this about? Nothing more nor less important than the need and convenience of the housewife herself!

Sooner or later she will insist on having the dressing table wired, for example—permanently wired—with outlets in it to receive such dressing table acces-

Wired table, doing away with unsightly wires from overhead fixture or mass of wiring beneath table.

sories as the electric hair weaver, hair drier and vibrator. If you've ever had to crawl under the dressing table or bend down half a dozen times a day to connect and disconnect these appliances—and the fan and vacuum cleaner besides—with the wall baseboard receptacles, you'd know how those two little outlets in the dressing table, right at her elbow, would appeal to a woman.

The dressing table, also, needs receptacles for those important items dear to the feminine heart, the electric curling iron and violet ray set. More than that, dressing tables are already being produced by furniture manufacturers having dainty lamps built on either side of the mirror, at the right angle to color softly milady's face while dressing, and of a design and quality in harmony with the result of the dressing table. Seeing women exclaim over this charming addition to a dressing table the wonder is only that more manufacturers have not followed the same example.

If for no other reason than to eliminate the need of bending so often, electric outlets in furniture would be justified, from the woman's point of view. In fact, that is the self-same reason that is dictating so many other changes in modern household equipment and furnishings. Why are kitchen sinks and drain boards being made higher now than formerly? Simply that the housewife need not bend while at work. For the same reason, cooking ranges are being built higher with ovens on a level with the elbows; the ironing board is built on an adjustable framework, so the housewife can raise it to the height most comfortable for her; with the new dustpan, she does not have to bend to sweep up the last pile of dust, and even the sanitary kitchen refuse can is made so that a touch of the foot on a spring causes the cover to open.

Count the number of times a day a woman would have to bend to connect her various electrical appliances to out-of-the-way outlets and you will appreciate the need for wired furniture. Even when the outlet is waist high a change of tenants or ownership frequently means that a piano, bed or china closet must come directly in front of the outlet, although such need not always be the case.

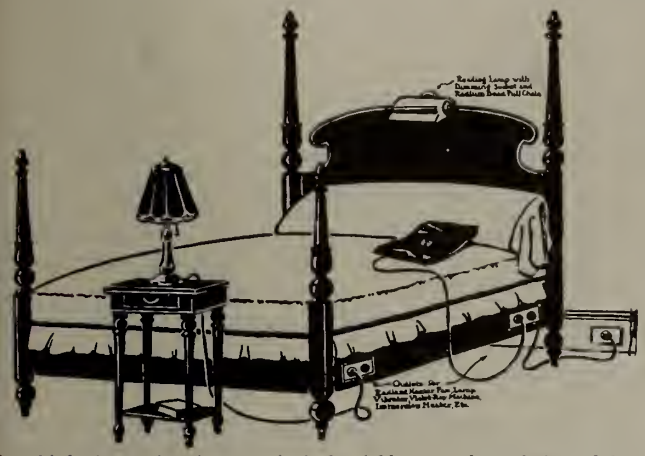
Wired Table vs. Dangling Cord Decorations

Yes, the electrical home of the future undoubtedly will have wired furniture, and one of the first pieces to go into it will be the wired dining room table. Knowing the daily pre-breakfast rites of many families in the ceremony of connecting the percolator to the lamp socket above the table and the toaster and waffle iron to the floor outlet, if not to another lamp socket, the wonder is not that there has been some grumbling but that those appliances continue to be used day after day despite the difficulties of connection! Surely a wholesale tribute to the value of electric table service!

The wired dining room table, of course, is nothing new, but once women generally know of its possibilities, they will look as keenly for it as they now look for the percolating element in coffee pots, or for laundry chutes in the prospective homes which they are inspecting. Now, the hostess has many anxious moments wondering whether her guests' feet are getting tangled in all the appliances and lamp cords under the table. With a wired table having simply three little outlets right under her hand, on the

wooden rim under the table's edge, she has easy control of all the table appliances at her finger's ends. With this arrangement, there need be no hole cut in the table top or in the housewife's treasured table linen and no dangling cords under the table. Also, the problem of connecting electric table candelabra is solved.

Then, there is the wired bed. Frequently the only place for the bed in a room is over against the wall



One-third of our time is spent in bed. Add to comfort of these 8 hours by making provision for use of electric appliances.

outlet. If one wants to use the heating pad in bed, he pushes the bed aside, or else connects the pad a dangerous length across the room to the lamp socket —or else, as more commonly happens, cannot use it at all in bed. Beds can be wired, however, to connect with that elusive baseboard outlet, the bed itself having two or more outlets in the side, so that merely by reaching down while in bed one can connect the heating pad. Also, a wired bed means the luxury of being able to turn on and off, while in bed, the electric fan in the window on hot summer nights, or to light the reading lamp, or to illuminate the clock dial, or, on cold winter mornings, turn on the radiant heater near the bed. Some furniture manufacturers have already produced beds with reading lamps or brackets built into the headboards, so that just by reaching up one can switch on or off the light for reading.

From Tea Wagon to Medicine Closet

The list of furniture articles on which electrical equipment would make an instant appeal to the housewife extends all the way from the tea wagon to the medicine chest. Any woman who has tried to use an electric samovar and toaster and perhaps a dainty lamp on her tea wagon knows what it means to have to disconnect all three if she wants to move the wagon a few feet or else have three cords trailing across the room. With the table itself wired and connected to a wall receptacle, her samovar, toaster and lamp are all conveniently plugged right in the tea wagon itself. Just to list a few of the other pieces that the housewife would like to see "electrified" there are:

Serving tables.—Frequently one must crawl under this table, also, to reach a wall receptacle. Wired somewhat on the plan of the dressing table, it should have receptacles for the percolator, samovar, toaster, iron, plate warmer, lamp—or even the vacuum cleaner!

China Closets.—Breakage of glassware and china on dark shelves may be prevented by having the cabinet interior equipped with lamps which automatically light when the door is opened and go out when it closes.

Kitchen Cabinet.—These also may be equipped, like the china closet, with automatic lighting, as well as with a receptacle in the side for the electric egg beater and mixer, polishing machine, dish washer, etc.

Refrigerator.—The refrigerator is often of necessity in a dark corner, and a lamp automatically lights the interior when the door is opened will at least keep one from dipping one's hand into the apple sauce when reaching for the milk bottle.

Davenports and Chairs.—These may be designed to accommodate electric cigar lighters and lamps—one furniture manufacturer is even making a davenport with an entire phonograph built into one arm, operated by attachment to the nearest electric receptacle.

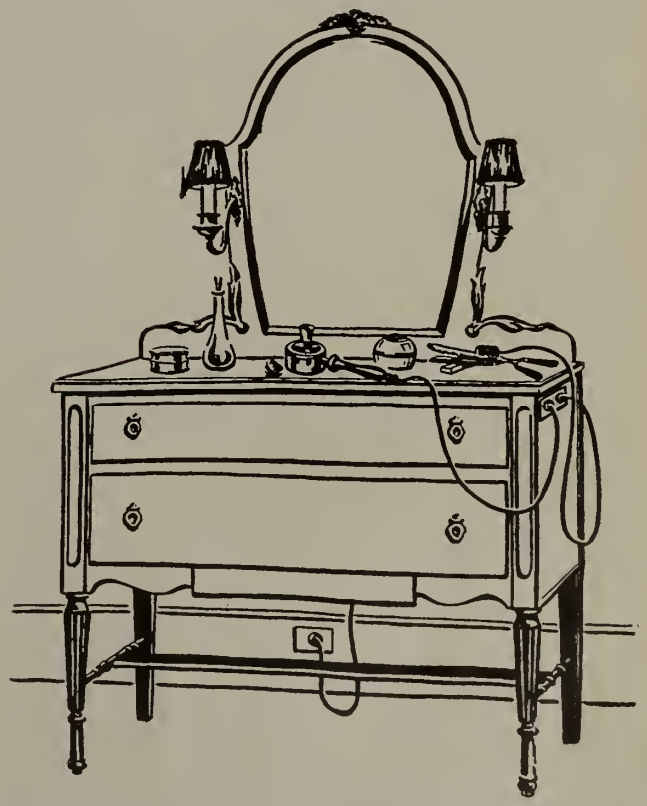
Desk.—Desk lamps, harmonizing in design and quality with the desk itself, may easily be made part of certain types of desks.

Pianos.—We have all seen pianos marred by having inharmonious lamps placed on them in the home. Two lamps built on the front of the instrument and harmonizing with it in design, add to its beauty and at the same time give better light to the music page.

Phonographs.—A small lamp that automatically lights the record when the cover is lifted keeps many a record from being scratched when music is being enjoyed at dusk.

Mirrors.—Small side brackets built on hall mirrors, shaving mirrors, bathroom cabinets, etc., throw far better light on the face than the ceiling light in the center of the room.

Porch Tables.—A porch table wired similarly to the dining room table will add much to the summer



Dressing table with permanent lamp brackets and outlets for electrical equipment.

enjoyment of the electric fan, samovar and reading lamp.

Sewing Machines.—Light concentrated on the sewing machine is welcomed by the woman who has to do sewing at night, and especially when she must thread the needle.

Engineering in Furniture Factories

Consideration of Power Plant and Type of Prime Mover—Economical Utilization of Factory Waste—Comfort and Accommodation of Employees

By B. A. Parks

(Concluded from April issue)

In many plants where breakdown service cannot be obtained from the local public-service company, and in fact oftentimes when such service is available, it will be found economical and convenient to install a small direct-connected high-speed generating unit to furnish lights at night and operate a few machines without its being necesary to operate the main engine. As the exhaust steam from such a unit will generally be all used in the heating system and dry kilns, the power generated is practically a by-product and the only cost for the power generated is the fixed charge incident to the additional investment. Such fixed charges will often be found to be less than the cost of breakdown service from the power company.

With regard to the drive from engine to lineshaft, either belt or rope transmission may be used, although the writer prefers the American system of rope drive to the belt as being somewhat smoother in operation and slightly more efficeint; the total stresses on engine and head-shaft bearings are less, also it requires less careful alignment of engine and lineshafts. The main generator may be either directly connected to the main engine shaft or be driven by belt or rope. The writer prefers the latter arrangement as being cheaper in first cost, allowing of operation of the plant in case of break down to generator, and also of changing the generator for a larger one should it be found that the electric load is going to increase beyond the capacity of the original generator.

Deciding on Boiler Capacity

In choosing boilers for the plant the capacity required may be determined from the total steam demand, adding an allowance of 10 to 15 per cent for pumps and other incidental uses throughout the plant. By dividing the total maximum boiler capacity required into at least three units it will always be possible to operate the plant on two boilers, for even with a maximum demand for steam two boilers will carry the plant by operating at 150 per cent of rating. It is decidedly poor economy to provide just enough boiler capacity to carry the maximum load, for this makes it necessary to do all cleaning and make repairs on Sundays. This means that such work will seldom be done as thoroughly as it should and it is bad for the morale of the power-plant crew for them to feel that they have got to spend nearly every Sunday of the year cleaning boilers or doing other necessary work on boilers when out of service. An even greater argument in favor of providing sufficient boiler capacity so that one boiler may always be out of service is in the interest of continuity of operation, for the failure of one boiler due to accident or other cause is very likely to cause a plant shutdown or even curtail production.

As regards the type of boiler to select, there is no difference in efficiency between a well-set horizontal return tubular boiler and a water-tube boiler. The choice is more dependent upon the capacity required. For any plant requiring a maximum of 500 to 600 b.hp. the writer would prefer the horizontal return tubular as being generally easier to care for and less likely to have accidents than the water-tube boiler. Plants of greater capacity than the above should generally consider the water tube as being preferable on account of space requirements.

Locating Power Plant

The pressure to be carried depends on the type of prime mover and as to whether the prime mover is to operate condensing or non-condensing. In non-condensing plants 100 to 125 lb. gauge pressure should be about the maximum, although the addition of 50 to 75 deg. of superheat will be found beneficial to economies of engines and pumps.

The location and arrangement of the power plant are important as regards the economical transmission of power to the factory and the allowance for increase in capacity. Where lineshaft drive is used the power plant is located in a separate building, preferably near the center of the main lineshaft, though of course within easy distance from engine shaft to main receiving shaft. This location of power plant is also fairly near the centre of distribution for steam and electric current. By arranging the boiler and engine rooms "back to back," that is, with centre line of boilers parallel with centre line of engine and with back of boilers toward the rear end of engine, and with the chimney at one end of boiler room, provision is made for extensions to the power plant without any disturbance of the original equipment. Whether the additional power units shall be arranged to deliver power by belt or electricity depends of course on where the additional power will be used.

Utilizing Factory Waste

The utilization of the factory waste or refuse so as to obtain the maximum fuel value is another problem which should receive its fair share of thought and study. Of course, shavings and sawdust from the various machines will be handled by an exhaust system to a separator on the boiler-house roof and then spouted to the boilers or shavings vault. In most plants the cuttings and culls are collected in push carts by a crew of men and wheeled to the boiler house where they are fed to the furnaces by hand. The above method of handling this part of the refuse is not only expensive from the standpoint of handling cost, but the full value of the refuse as fuel is not realized due to the manner of firing. The installation of a few small "hogs" or chippers, at convenient points in the plant where cuttings collect, discharging into the regular exhaust system will in many cases be found to be a paying investment. The power consumption is considerable and a certain amount of maintenance is required, but these disadvantages will frequently be found to be outweighed by the decreased labor cost and the increased efficiency obtained in burning the fuel. Tests have shown that cuttings run through a hog and spouted to the furnaces in the regular way are worth 25 to 30 per cent more as fuel than when

fed as cuttings into the furnace by hand. This question of the installation of hogs is an individual problem for each plant and can only be intelligently decided by considering all the factors entering into each case.

Another improvement in the handling of refuse is in regard to feeding the excess shavings and sawdust which ordinarily are allowed to collect during the day in a so-called shavings vault. In most plants the contents of the shavings vaults must be fed to the furnaces with a shovel, which is not only laborious but prevents the full fuel value being realized. In the design of a power plant for a woodworking factory for which the writer was partly responsible, overhead bins were installed instead of the customary shavings vault. These bins fed by gravity to a short length of screw conveyor discharging into the furnace fronts, a separate conveyor being provided for each boiler. The speed of these conveyors could be varied by means of a friction drive, thus allowing the quantity of shavings and sawdust fed to the furnace to be regulated in accordance with the load on the boiler. The tendency of the shavings and sawdust to arch over and thus stop feeding was overcome by a simple installation of "fingers" on a shaft leading through the lower part of the bin arranged to be tripped periodically by an eccentric and connecting rod actuated from the conveyor drive shaft. A small blower was also installed with a branch duct arranged to discharge a current of air just below each outlet into the furnace from the screw conveyor and thus blow the shavings and sawdust into the furnace in the same manner as they are spouted from the separator. With a fairly constant boiler load the above installation is entirely automatic and it is no longer necessary to burn coal to augment the refuse fuel which at night was previously necessary.

Conserving Steam and Fuel

Almost, if not quite, as essential to the successful and economical operation of the power plant as the proper selection of the boilers and engines, is the careful consideration given to the auxiliaries such as pumps, feedwater heater, etc. Also the piping layout should be thoughtfully designed, keeping in mind continuity of service and convenient control of all equipment in the plant. Another feature which is not usually found in industrial power plants, particularly the small and medium-sized ones, is a suitable selection of recording gauges and instruments for indicating and recording steam pressure, feedwater temperature, quantity of feedwater, electric power generated, and other data having a bearing on proper cost keeping for the power plant. With the present prices of fuel, oil, and other supplies, it is quite as essential to watch the costs of power production as it is to watch costs in other departments of an industrial institution.

In a woodworking establishment the fire hazard is naturally much greater than in a metal-working plant, consequently more than ordinary care should be exercised in decreasing the fire hazard to a minimum and preventing the spread of fire in case it does start. Buildings should probably not exceed 250 to 300 feet in length without dividing them by suitable fire walls at least 17 inches thick, and extending well above the roof line. Finishing and upholstering departments should if possible be isolated from the rest of the plant by fire walls, and if they are on upper floors and any great distance from stairways, outside fire escapes should be provided. The building codes in many cities require fire escapes on all buildings exceeding certain heights and floor areas.

As already mentioned, all stair wells and elevator shafts should be enclosed in fireproof towers, and to make fire walls and fireproof towers effective all openings should be fitted with automatic fire doors. It is also well to note that all stairs should be of non-combustible material so they cannot be destroyed in case fire is communicated to the stair well itself. All sash should be steel and the windows opposite adjacent buildings, where buildings are 30 ft. apart or less, should be glazed with wire glass. It almost goes without saying that a good sprinkler system should be installed throughout the entire plant with plenty of yard hydrants and a good supply of fire hose. All motor-control switches should be enclosed in steel boxes so arranged that the box cannot be opened when the switch is closed. This precaution is not only in the interest of fire prevention but accident prevention as well. All switches for motors driving spray-booth fans, or for motors in other locations where inflammable gas or dust is prevalent, should be of the remote-control type enclosed in tight steel or iron cases, with a push button near the booth or other machine. Spray-booth fires are a constant source of danger and the method above mentioned of controlling the fan motors is well worth the investment required. Other precautions in either preventing fires or preventing their spreading will apply to certain plants, but the above suggestions will outline the main points to be considered.

Under accommodations for workers may be included the lighting, heating, toilet, and locker-room arrangements of the plant. While some of these features may not be considered as being entirely for the accommodation or comfort of the workers, yet the writer believes they have such a bearing on the morale of the working force that the greatest benefit derived from properly designed equipment as mentioned is through an increased efficiency on the part of the employees. The day of the dark, poorly heated and ventilated factory building with inadequate and unsanitary toilet facilities is past, for the simple reason, if for no other, that any self-respecting man will not work under such conditions; and if the employer with such a factory does obtain a working force he may be sure that he is getting only the flotsam and jetsam of the laboring class and the result will be reflected in both the quantity and quality of his product. Bright, cheerful surroundings, comfortably heated and well ventilated, with adequate sanitary facilities, including a supply of good drinking water, are no longer regarded as an expense by the modern executive but as an investment which pays large returns in increasing production and quality of product, decreasing labor turnover and promoting contentment and loyalty among the employees.

Lighting Important Consideration

The far-too-usual method of providing a drop cord with a bare lamp over each machine or at each workman's bench with a few thrown in for general illumination should not be tolerated in this day and age when good, efficient fixtures may be had at such reasonable cost. While "spotted" fixtures over some machines may be advisable, the writer much prefers good general illumination throughout the entire working space. Where walls and ceilings are painted white with some good industrial enamel, efficient light-

In Which Class Does Your Plant Belong?

Interesting Figures Gathered From Many Factories--Electric Power Favored in Numerous Plants—Group Drive Most Popular Installation

Electricity as a prime mover for woodworking plants has been receiving a considerable amount of attention during recent years and many are the arguments that have been brought forward for and against the electric drive. Without entering into a technical discussion as to the relative merits or demerits, advantages or disadvantages of the electric motor with

50 H.P. motor direct connected to fast feed planer.

particular reference to the peculiar problems encountered in the woodworking industry, it would appear as if this form of power is being employed on an ever-increasing scale.

In an endeavor to determine to what extent electric motors were being used in the different woodworking plants, the "Canadian Woodworker" sent a questionnaire to a large number of woodworkers in Ontario. About 257 of these responded and some very interesting conclusions may be drawn from the information and figures furnished. Perhaps it would be well to state that this set of questions was not sent to a specially selected list but rather to representative manufacturers selected at random without considering the wealth or size of the firms approached. The number of replies received represents only a small percentage of the number of woodworking concerns in Canada, yet was sufficiently large to permit of some clear-cut deductions being made which should apply with equal force not only to the industry in Ontario but to the whole Canadian woodworking industry as a unit.

Many Plants Fully Equipped

257 plants, from which replies were received, may be divided as follows: Fully motor-driven, 129; steam-driven, 82; partially steam and partially electrically-driven, 46. The combined horse power of the motors installed in these plants totals 10,570, or an average of about 40 h.p. per factory, including both steam and electrically-driven plants. This leaves a considerable field for future development as the power requirements of different woodworking plants would average about 100 h.p. each. 227 reported that power was available in their district, while 11 stated that current would be available at an early date, and 19 stated that they d d not know when it would be procurable in their district. A number of those replying intimated their intention of changing to electricity in the near future.

An objection often made to electric power is that when steam is used the waste and shavings supply the greater part of the fuel required, while with an electric installation the fuel value of this material would be lost, and in addition the disposal of this waste presents a problem of no mean importance. Out of 128 factories, which are fully or partially steam-driven, 108 report that they find it necessary to purchase coal to supplement the waste from the plant. It would appear that power generated from coal at present prices would prove to be costly, to say the least. An electric installation large enough to take care of the excess power requirements over and above that supplied by the fuel gathered around the plant, would seem to be a better proposition than buying coal.

A closer analysis of the information furnished by those plants which are either partially or completely electrically-driven shows that 163 prefer the group drive, while 21 have adopted what is known as the "individual motor installation." Of the latter, some have gone into it on a very large scale, for instance, the Brunswick-Balke Collender Co. with 85 motors, totalling 535 h.p. This is a fine example of a plant completely motor-driven. Some of the other individual installations are as follows:—

20	motors	totalling	200	h.p.
20	"	"	150	"
20	"	"	125	"
9	"	"	145	"
9	"	"	70	"
13	"	"	175	"
44	"	"	135	"
14	"	"	400	"

Reduces Transmission Losses

The squirrel cage A.C. induction motor is the type favored in practically all plants. This seems to be about the best all-round motor for use in the woodworking industry. It is reliable, requires very little attention, will carry an overload for short periods and with its use there is very little danger from fire. One fact brought out was that with either an individual or group installation, transmission losses are reduced in some cases as much as 50 per cent.

The group installation, coupled with ball-bearing transmission, would appear to be about the most efficient form of installation that could be made. While on the face of it the individual drive appears to be ideal, yet often the initial cost is so high that the carrying charges would more than wipe out any savings which might be made. This is one reason why the group drive is favored. This must be taken to apply in a general way, for there are many instances where the individual drive is by far the best.

Best Motor for Woodworking Installations

Outline of Development of Induction A.C. Motor—Specially Adapted for this Industry—Protective Devices which Tend for Greater Safety

By W. O. Taylor*

The nature of the conditions in a woodworking plant, unavoidable on account of the material handled, requires electrical equipment of the simplest possible construction, and with the least possible degree of fire hazard. This prime reason and the fact that the very large majority of our power distribution systems are alternating current, has made the alternating current motor almost universal as an electrical driving unit in this industry. For this reason only alternating current motors and alternating current equipment is being considered in the following paragraphs:

The induction motor is about the simplest driving unit known, and the fact that it is a constant speed machine and has an even torque, makes it an ideal driving unit for almost any woodworking machine. The nature of the location, with the presence of a certain amount of wood dust in the atmosphere, makes it necessary for the driving unit to be free from moving contacts, liable to cause arcing, and to have a sturdy construction capable of withstanding the accumulation of this wood dust deposit. A squirrel cage induction motor, having modern electrical construction and when of good sturdy mechanical construction, admirably fulfils these requirements.

Development of Induction Motors

A brief history of the development of the squirrel cage winding or rotor construction of induction motors, will no doubt be of interest, as it has advanced especially to the advantage of the woodworking industry. The early design of squirrel cage windings embodied end rings which were soldered to the ends of the rotor bars in all sizes of machines. A subsequent development made use of heavy copper end rings which were bolted to the ends of the bars, the contact being further strengthened by the use of lock washers. This construction was not applied to very small sizes as it was practically impossible to assemble this construction in very small sizes. It was, however, a distinct advance over the use of the soldered construction in the larger sizes, as it is easy to appreciate the disadvantage of the use of solder on account of the fact that under extreme temperature conditions, such as may be caused by very heavy overload, solder is liable to melt and be thrown out causing small arcing in the rotor winding and with great danger of injury to the stator windings, and a considerable fire hazard where inflammable material is in the atmosphere or close by.

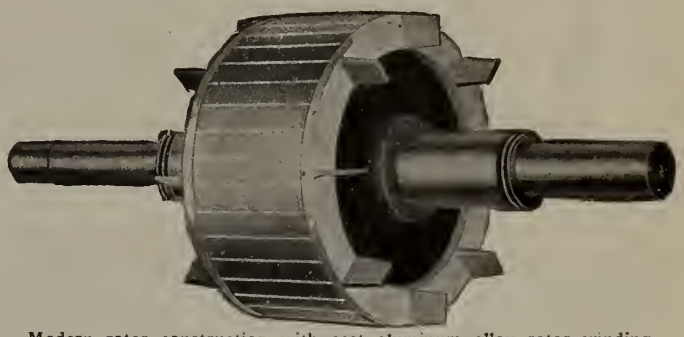
A further advance has been made in the mechanical construction of these motors during the last few years, which has brought this machine to a remarkable degree of simplicity and safety. This consists of the all cast rotor winding, or as it is frequently described, cast aluminum rotor construction. In this construction, the laminations, end supports and shaft of the rotor are first assembled together and by placing in a suitable mould, the rotor bars and rotor end rings are cast in one operation of aluminum alloy. This makes an absolutely solid winding construction, bars and end rings being of one piece. This aluminum alloy is also found to have excellent properties for this service.

*Northern Electric Co., Limited.

Soldered Connections Eliminated

Another excellent rotor construction developed in recent years, is the welded or cast welded construction, in which the copper bars are welded together and end rings formed by two different methods. One method is by using spacers of copper between the individual bars and welding them all together, forming the end ring out of the welded ends of the copper bars and the spacers. Another very satisfactory method is by setting the rotor on end with the ends of the bars in a suitable mould and cast welding a copper end ring to the ends of the rotor bars. The latter welded, or cast welded construction, is generally used in medium and larger sized motors, and by some firms used in all sizes. The all cast windings, or cast aluminum construction, cannot economically be made in the larger sizes, as the quantity of machines built in the larger sizes would make the cost of such machines too high on account of the high cost of the tools necessary to form this construction.

While it has been possible to remove the soldered connections from the rotor construction and provide



Modern rotor construction with cast aluminum alloy rotor winding.

a remarkably sturdy trouble-proof machine, it is impossible to provide stator windings having quite the same degree of simplicity. The design and construction of the coil windings have, however, also been developed to a degree where the amount of trouble is negligible under all reasonable operating conditions. The coils in the medium and larger sized motors are generally form wound; this construction enables the coils to be thoroughly insulated and baked, and made practically a solid piece before placing in the slots of the machine. Some manufacturers have also arranged to make up their coils in groups of the maximum number allowable in the particular rating, which reduces largely the number of joints and connections necessary after the windings are placed in the machine.

Require Reasonable Attention

The form wound construction cannot practically be furnished in very small sizes, and in the small motors where it is necessary to use hand wound coils, care is made to give the utmost protection by dipping and baking the entire frame and windings after connections are made. This brings this construction as nearly as possible on a degree of service, to equal the

form wound coils used in the medium and larger sized machines.

Of particular importance to woodworking plant operators, is the mechanical construction of motors used, and the modern induction motor as built by leading high-class manufacturers, here also gives the maximum degree of service with very little attention and practically no trouble. The bearings are of liberal size and generally designed to be oil and dust tight, and to prevent any oil from getting on to the shaft and into the windings. The bearings are almost always provided with an oil gauge and an outlet, and by giving a little attention periodically to the bearings, a very long satisfactory service will be ensured.

Safety in Starting Devices

Squirrel cage motors of 7½ h.p. capacity and over, are usually provided with an oil immersed starter, generally equipped with a no-voltage release to trip the starter, and cut out the motor when the power goes off. This equipment is furnished by the motor manufacturers complete with the motors of medium and larger sizes.
